# FOREWORD

MINERALS YEARBOOK, 1960, published in three volumes, provides a record of performance of the Nation's mineral industries during the year, with enough background information to interpret the year's developments.

The three-volume issues of the Yearbook follow this pattern:

Volume I includes chapters on metal and nonmetal mineral commodities, except mineral fuels. In addition, it includes a chapter reviewing these mineral industries, a statistical summary, and chapters on mining and metallurgical technology, employment, and injuries, and technologic trends. One new chapter, High-Purity Silicon, has been added to the list of commodity chapters. The chapter on Nonferrous Secondary Metals has been discontinued and the statistical material in it distributed to the appropriate nonferrous metals commodity chapters.

Volume II includes chapters on each mineral fuel, an employment and injuries presentation, and a mineral-fuels review chapter that summarizes developments in the fuel industries.

Volume III contains chapters covering each of the 50 States, plus chapters on island possessions in the Pacific Ocean and the Commonwealth of Puerto Rico and island possessions in the Caribbean Sea, including the Canal Zone. Volume III also has a statistical summary chapter, identical with that in Volume I, and a chapter on employment and injuries.

Figures in the Minerals Yearbook are based largely upon information supplied by mineral producers, processors, and users, and acknowledgment is made of this indispensable cooperation given by industry. Information obtained from individuals through confidential surveys has been grouped to provide statistical aggregates. Data on individual producers are presented only if available from published or other nonconfidential sources, or when permission of the individuals concerned has been granted.

MARLING J. ANKENY, *Director.*

# ACKNOWLEDGMENTS

In preparing this volume of the MINERALS YEARBOOK, the Bureau of Mines was assisted in collecting statistical data and mineral-industry information by State agencies, through cooperative agreements. Many State chapters were reviewed by staff members of these agencies, and in some instances the staff members collaborated in preparing the chapters and are shown as coauthors. For this assistance acknowledgment is made to the following cooperating organizations:

**Alabama:** Geological Survey of Alabama.
**Alaska:** Department of Natural Resources.
**Arizona:** Arizona Bureau of Mines.
**Arkansas:** Geological and Conservation Commission; Arkansas Oil and Gas Commission; Department of Revenue.
**California:** Division of Mines.
**Delaware:** Delaware Geological Survey.
**Florida:** Florida Geological Survey.
**Georgia:** Geological Survey of Georgia.
**Idaho:** Bureau of Mines and Geology.
**Illinois:** State Geological Survey Division.
**Indiana:** Geological Survey, Department of Conservation.
**Iowa:** Iowa Geological Survey.
**Kansas:** Conservation Division, State Corporation Commission and State Geological Survey of Kansas.
**Kentucky:** Kentucky Geological Survey.
**Louisiana:** Louisiana Geological Survey and Louisiana Department of Conservation.
**Maine:** Geological Survey of Maine.
**Maryland:** Department of Geology, Mines, and Water Resources.
**Michigan:** Geological Survey Division, Department of Conservation.
**Minnesota:** Minnesota Geological Survey.
**Mississippi:** Mississippi Geological Survey, Mississippi State Oil and Gas Board, and Oil and Gas Severance Tax Division, Mississippi State Tax Commission.
**Missouri:** Division of Geological Survey and Water Resources, Department of Business Administration.
**Montana:** Montana Bureau of Mines and Geology.
**Nevada:** Nevada Bureau of Mines.
**New Hampshire:** New Hampshire State Planning and Development Commission.
**New Jersey:** Bureau of Geology and Topography.
**New York:** New York State Science Service.
**North Carolina:** Geological Survey of North Carolina.
**North Dakota:** North Dakota Geological Survey.
**Oklahoma:** Oklahoma Geological Survey and Oil and Gas Conservation Department; Oklahoma Corporation Commission, Gross Production Division; Oklahoma Tax Commission.
**Oregon:** State Department of Geology and Mineral Industries.
**Pennsylvania:** Bureau of Topographic and Geological Survey.
**Puerto Rico:** Mineralogy and Geology Section, Economic Development Administration, Commonwealth of Puerto Rico.
**South Carolina:** Geological Survey of South Carolina.
**South Dakota:** State Geological Survey.
**Tennessee:** Department of Conservation and Commerce.

Digitized by Google

**Texas: Bureau of Economic Geology, The University of Texas; Oil and Gas Division, Railroad Commission of Texas; Oil and Gas Division, State Comptroller of Public Accounts.**
**Utah: Utah Geological and Mineralogical Survey.**
**Virginia: Division of Mineral Resources.**
**Washington: Division of Mines and Geology, Department of Conservation and Development.**
**West Virginia: West Virginia Geological and Economic Survey.**
**Wisconsin: Wisconsin Geological Survey.**
**Wyoming: The Geological Survey of Wyoming.**

Except for the two review chapters, this volume was prepared by the field staffs of the five Divisions of Mineral Resources. The following supervised preparation of the chapters: Ottey M. Bishop, chief, Division of Mineral Resources, Region I, Albany, Oreg.; W. F. Dietrich, chief, Division of Mineral Resources, Region II, San Francisco, Calif.; A. S. Konselman, acting chief, Division of Mineral Resources, Region III, Denver, Colo.; Robert S. Sanford, chief, Division of Mineral Resources, Region IV, Bartlesville, Okla.; and G. W. Josephson, chief, Division of Mineral Resources, Region V, Pittsburgh, Pa. Preparation of this volume was supervised and the chapters coordinated with those in volumes I and II by Donald R. Irving, assistant to the chief, Division of Minerals.

Statisticians and researchers in the Division of Mineral Resources who gave substantial assistance to the authors of the chapters were: In Region I, Clara M. Hutcheson; in Region II, Betty Tong and Sophie H. Chibidakis; in Region III, Stella K. Drake, Mary Jelliffe, Muriel Clark, and Elsie Kellogg; in Region IV, Dorothy Underwood, Lorraine Collier, Betty Siggins, Lydia DeRuvo, and Lovenia Edwards; in Region V, (Pittsburgh) Michael E. Bursic, Victoria M. Dorchak, and Stephanie A. Dzienis, (Knoxville) Martha E. Peeples and Mildred K. Rees, (Minneapolis) Marguerite H. Beahan, Richard J. Bishop, Estelle E. Rand, Don N. West, Wanda J. West, and Agnes N. Anshus.

The manuscripts upon which this volume is based have been reviewed to insure statistical consistency among the tables, figures, and text, between this volume and volume I and between this volume and those for former years, by a staff supervised by Kathleen J. D'Amico, who was assisted by Julia Muscal, Helen L. Gealy, Helen E. Tice, Dorothy Allen, Mary E. Daugherty, and Joseph Spann.

Minerals Yearbook compilations are based largely on data provided by the mineral industries. Acknowledgment is made of the willing contribution both by companies and individuals of these essential data.

CHARLES W. MERRILL,
*Chief, Division of Minerals.*

# Statistical Summary of Mineral Production

By Kathleen J. D'Amico [1]

THIS SUMMARY is shown in Minerals Yearbook volumes I and III of this series on mineral production in the United States, its island possessions, the Canal Zone, and the Commonwealth of Puerto Rico, and on the principal minerals imported into and exported from the United States. The several commodity and area chapters contain further details on production. A summary table comparing world and U.S. mineral production also is included.

Mineral production may be measured at any of several stages of extraction and processing. The stage of measurement used in the chapter is normally what is termed "mine output." It usually refers to minerals in the form in which they are first extracted from the ground, but customarily includes for some minerals the product of auxiliary processing operations at or near mines.

Because of inadequacies in the statistics available, some series deviate from the foregoing definition. The quantities of gold, silver, copper, lead, zinc, and tin are recorded on a mine basis (as the re-

coverable content of ore sold or treated). The values assigned to these quantities, however, are based on the average selling price of refined metal, not the mine value. Mercury is measured as recovered metal and valued at the average New York price for metal.

Data for clays and stone, 1954–60, included output used in making cement and lime. Mineral-production totals have been adjusted to eliminate duplicating these values.

The weight or volume units shown are those customary in the particular industries producing the respective commodities. No adjustment has been made in the dollar values for changes in the purchasing power of the dollar.

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Includes small quantity of anthracite mined in States other than Pennsylvania.
[3] Preliminary figure.
[4] Grindstones, pulpstones, millstones, grinding pebbles, and tubemill liners, weight not recorded; excludes value of sharpening stones (1957-58), value for which is included with "Nonmetal items that cannot be disclosed."
[5] Excludes tubemill liners, value for which is included with "Nonmetal items that cannot be disclosed."
[6] Revised figure.
[7] Weight not recorded.
[8] Figure withheld to avoid disclosing individual company confidential data; value included with "Nonmetal items that cannot be disclosed."
[9] Beginning with 1958 slate included with stone.
[10] Excludes abrasive stone, bituminous limestone, bituminous sandstone, and ground soapstone, all included elsewhere in table.
[11] Total adjusted to eliminate duplicating value of clays and stone.
[12] Figure withheld to avoid disclosing individual company confidential data; value included with "Metal items that cannot be disclosed."
[13] Excludes quantity consumed by American Chrome Co.
[14] Total weight of columbite-tantalite plus (Cb–Ta)$_2O_5$ content of euxenite.
[15] Final figure. Supersedes preliminary figure given in commodity chapter.

**TABLE 4.—Value of mineral production in the United States and principal minerals produced in 1960**

(Thousand dollars)

| State | 1957 | 1958 | 1959 | 1960 | | | |
|---|---|---|---|---|---|---|---|
| | | | | Value | Rank | Percent of U.S. total | Principal minerals in order of value |
| Alabama | $209,549 | $188,938 | $200,847 | $217,617 | 19 | 1.22 | Coal, cement, stone, iron ore. |
| Alaska | 28,792 | 21,450 | 20,495 | 21,858 | 44 | .12 | Coal, gold, sand and gravel, petroleum. |
| Arizona | 372,641 | 314,520 | 326,862 | 415,776 | 14 | 2.32 | Copper, sand and gravel, cement, zinc. |
| Arkansas | 142,685 | 132,520 | 140,594 | 155,039 | 26 | .87 | Petroleum, bauxite, stone, sand and gravel. |
| California | 1,650,035 | 1,500,367 | 1,433,626 | 1,402,214 | 3 | 7.84 | Petroleum, natural gas, cement, sand and gravel. |
| Colorado | 338,504 | 306,566 | 314,677 | 342,223 | 17 | 1.91 | Petroleum, molybdenum, natural gas, uranium. |
| Connecticut | 16,055 | 13,128 | 12,930 | 15,255 | 45 | .09 | Stone, sand and gravel, lime, clays. |
| Delaware | 1,042 | 1,142 | 1,284 | 989 | 50 | .01 | Sand and gravel, stone, clays. |
| District of Columbia | 72 | 72 | 75 | 71 | | (1) | |
| Florida | 140,467 | 142,114 | 163,446 | 176,920 | 24 | .99 | Phosphate rock, stone, cement, titanium. |
| Georgia | 69,799 | 75,106 | 86,262 | 91,203 | 30 | .51 | Clays, stone, cement, sand and gravel. |
| Hawaii | 5,930 | 6,298 | 7,630 | 9,254 | 47 | .05 | Stone, sand and gravel, pumice, cement. |
| Idaho | 73,502 | 64,648 | 70,209 | 57,441 | 35 | .32 | Silver, phosphate rock, lead, zinc. |
| Illinois | 576,324 | 576,862 | 572,275 | 590,800 | 8 | 3.30 | Petroleum, coal, stone, sand and gravel. |
| Indiana | 198,034 | 197,677 | 206,359 | 206,882 | 20 | 1.16 | Coal, cement, stone, petroleum. |
| Iowa | 68,986 | 85,356 | 88,557 | 95,030 | 29 | .53 | Cement, stone, sand and gravel, gypsum. |
| Kansas | 511,513 | 503,788 | 508,077 | 483,958 | 10 | 2.70 | Petroleum, natural gas, cement, stone. |
| Kentucky | 449,390 | 402,121 | 418,821 | 413,517 | 15 | 2.31 | Coal, petroleum, stone, natural gas. |
| Louisiana | 1,517,522 | 1,523,370 | 1,766,269 | 1,967,652 | 2 | 11.00 | Petroleum, natural gas, natural gas liquids, sulfur. |
| Maine | 12,711 | 12,574 | 13,278 | 13,648 | 46 | .08 | Cement, sand and gravel, stone, mica. |
| Maryland | 39,625 | 45,735 | 53,189 | 55,527 | 37 | .31 | Cement, stone, sand and gravel, coal. |
| Massachusetts | 24,789 | 23,887 | 25,916 | 27,588 | 42 | .15 | Sand and gravel, stone, lime, clays. |
| Michigan | 404,673 | 343,487 | 381,297 | 429,055 | 13 | 2.40 | Iron ore, cement, petroleum, sand and gravel. |
| Minnesota | 584,038 | 395,880 | 347,178 | 515,255 | 9 | 2.88 | Iron ore, sand and gravel, stone, cement. |
| Mississippi | 144,950 | 151,411 | 186,116 | 19 ,862 | 22 | 1.11 | Petroleum, natural gas, cement, sand and gravel. |
| Missouri | 152,913 | 144,120 | 157,189 | 156,033 | 25 | .87 | Cement, stone, lead, lime. |
| Montana | 191,750 | 176,728 | 167,328 | 178,854 | 23 | 1.00 | Petroleum, copper, sand and gravel, phosphate rock. |
| Nebraska | 82,928 | 90,047 | 97,130 | 103,687 | 28 | .58 | Petroleum, cement, sand and gravel, stone. |
| Nevada | 86,023 | 68,291 | 70,164 | 80,285 | 31 | .45 | Copper, sand and gravel, lime, iron ore. |
| New Hampshire | 3,331 | 3,919 | 4,722 | 5,317 | 49 | .03 | Sand and gravel, mica, stone, feldspar. |
| New Jersey | 64,642 | 50,380 | 59,479 | 56,409 | 36 | .32 | Stone, sand and gravel, iron ore, magnesium compounds. |
| New Mexico | 551,155 | 559,777 | 592,535 | 652,200 | 7 | 3.65 | Petroleum, natural gas, potassium salts, uranium. |
| New York | 244,114 | 205,338 | 234,642 | 254,713 | 18 | 1.42 | Cement, stone, sand and gravel, iron ore. |
| North Carolina | 37,570 | 39,891 | 40,789 | 44,968 | 40 | .25 | Stone, sand and gravel, copper, feldspar. |

## TABLE 5.—Mineral production [1] in the United States, by States—Continued

### NORTH CAROLINA

| Mineral | 1957 | | 1958 | | 1959 | | 1960 | |
|---|---|---|---|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Abrasive stones.....short tons | (12) | [20] $5 | (12) | [20] $2 | [21] 191 | [21] $5 | (12) | [20] $2 |
| Beryllium concentrate.....short tons, gross weight | 1 | 1 | (11) | (6) | | | | |
| Clays [3].....thousand short tons | 2,302 | 1,407 | 2,046 | 1,187 | 2,524 | 1,522 | 2,476 | 1,548 |
| Feldspar.....long tons | 233,430 | 2,728 | (4) | (4) | (4) | (4) | 270,761 | 2,781 |
| Gem stones | (12) | (5) | (12) | 1 | (12) | 0 | (12) | 4 |
| Gold (recoverable content of ores, etc.).....troy ounces | 1,373 | 48 | 870 | 31 | 965 | 34 | 1,820 | 64 |
| Lead (recoverable content of ores, etc.).....short tons | 9 | 3 | | | | | 424 | 90 |
| Mica: | | | | | | | | |
| Scrap.....do | 53,452 | 1,173 | 50,807 | 1,041 | 47,736 | 1,212 | 47,281 | 1,100 |
| Sheet.....pounds | 577,007 | 1,575 | 521,701 | 1,722 | 605,624 | 1,756 | 430,104 | 1,411 |
| Sand and gravel.....thousand short tons | 6,820 | 5,724 | 7,041 | 5,890 | 8,580 | 7,126 | 8,801 | 7,453 |
| Silver (recoverable content of ores, etc.).....thousand troy ounces | 12 | 11 | 15 | 14 | 16 | 15 | 212 | 192 |
| Stone.....thousand short tons | [7] 9,455 | [7] 12,839 | 12,385 | 19,132 | 12,859 | 20,303 | 14,721 | 23,206 |
| Talc and pyrophyllite.....short tons | 120,905 | 558 | 120,158 | 614 | 127,206 | 647 | 100,593 | 549 |
| Tungsten concentrate.....short tons, 60-percent $WO_3$ basis | 1,828 | (4) | (4) | (4) | (4) | (4) | (4) | (4) |
| Zinc (recoverable content of ores, etc.).....short tons | 2 | (4) | | | | | | |
| Value of items that cannot be disclosed: Abrasive stone (grinding pebbles and tube-mill liners, 1957-58, millstones 1959), asbestos, clay (bentonite 1957, kaolin 1958-60), copper, iron ore (1959-60), lithium minerals, olivine, slate (1957), stone (dimension granite, crushed basalt, dimension and crushed marble, crushed limestone, and crushed sandstone 1957), and values indicated by footnote 4 | | 11,408 | | 10,267 | | 7,802 | | 6,469 |
| Total North Carolina | | 37,570 | | 30,891 | | 40,780 | | 44,808 |

### NORTH DAKOTA

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Clays [3].....thousand short tons | 54 | $67 | 54 | $66 | 61 | $70 | 102 | $120 |
| Coal (lignite).....do | 2,501 | 5,047 | 2,314 | 5,409 | 2,418 | 5,426 | 2,525 | 5,790 |

## TABLE 5.—Mineral production [1] in the United States, by States—Continued

### TENNESSEE

| Mineral | 1957 | | 1958 | | 1959 | | 1960 | |
|---|---|---|---|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Cement.....thousand 376-pound barrels | 7,415 | $22,806 | 8,375 | $26,408 | 9,153 | $28,934 | 8,246 | $27,384 |
| Clays.....thousand short tons | 1,154 | 4,228 | 935 | 4,210 | 1,146 | 4,952 | 1,270 | 4,537 |
| Coal.....do | 7,955 | 31,147 | 6,785 | 25,969 | 5,913 | 23,581 | 5,930 | 21,154 |
| Copper (recoverable content of ores, etc.).....short tons | 9,790 | 5,894 | 9,109 | 4,791 | 11,490 | 7,055 | 12,723 | 8,168 |
| Gem stones | | | [12] | 1 | [12] | [3] | [12] | 1 |
| Gold (recoverable content of ores, etc.).....troy ounces | 172 | 6 | 124 | 4 | 99 | 3 | 123 | 4 |
| Iron ore (usable).....thousand long tons, gross weight | [4] | [4] | [4] | [4] | 21 | 111 | [4] | [4] |
| Lime.....thousand short tons | 94 | 1,134 | [4] | [4] | [4] | [4] | [4] | [4] |
| Manganese ore (35 percent or more Mn).....short tons, gross weight | 12,938 | 1,007 | 5,935 | 452 | 7,586 | 589 | 283 | 15 |
| Manganiferous ore (5 to 35 percent Mn).....do | | | | | 56 | 1 | [4] | [4] |
| Natural gas.....million cubic feet | 38 | 6 | 54 | 9 | 52 | 9 | 63 | 11 |
| Petroleum (crude).....thousand 42-gallon barrels | 7 | [4] | 7 | [4] | [7] 6 | [4] | [8] 6 | [4] |
| Phosphate rock.....thousand long tons | 1,812 | 12,514 | 1,903 | 13,041 | 1,755 | 13,255 | 1,939 | 15,424 |
| Sand and gravel.....thousand short tons | 5,617 | 6,641 | 5,612 | 6,671 | 6,221 | 7,570 | 6,293 | 7,655 |
| Silver (recoverable content of ores, etc.).....thousand troy ounces | 54 | 49 | 44 | 40 | 60 | 54 | 65 | 58 |
| Stone.....thousand short tons | [7] 15,354 | [7] 24,155 | [7] 16,850 | [7] 26,814 | 18,767 | 29,094 | 20,074 | 29,942 |
| Zinc (recoverable content of ores, etc.).....short tons | 58,063 | 13,470 | 59,130 | 12,062 | 89,932 | 20,684 | 91,394 | 23,579 |
| Value of items that cannot be disclosed: Barite, fluorspar (1957), scrap mica, pyrites, stone (crushed sandstone 1957–58, crushed granite 1957, dimension limestone 1958) and values indicated by footnote 4 | | 8,029 | | 6,884 | | 7,392 | | 7,570 |
| Total Tennessee [9] | | 128,739 | | 124,934 | | [8] 140,738 | | 143,439 |

### TEXAS

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Cement.....thousand 376-pound barrels | 22,144 | $68,541 | 25,875 | $79,756 | 27,991 | $88,067 | 23,365 | $76,577 |
| Clays [3].....thousand short tons | 2,992 | 4,934 | 3,720 | 5,424 | 3,870 | 5,703 | 3,302 | 5,058 |
| Gem stones | [12] | 100 | [12] | 100 | [12] | 100 | [12] | 100 |

| Total Wyoming [5]..... | ---------- | 352,532 | ---------- | 369,938 | ---------- | [6]393,841 | ---------- | 442,736 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Excludes certain cement, included with "Value of items that cannot be disclosed."
[3] Excludes certain clays, included with "Value of items that cannot be disclosed."
[4] Figure withheld to avoid disclosing individual company confidential data.
[5] Less than $1,000.
[6] Preliminary figure.
[7] Excludes certain stone, included with "Value of items that cannot be disclosed."
[8] Revised figure.
[9] Total adjusted to eliminate duplicating value of clays and stone.
[10] Less than 1,000 short tons.
[11] Less than 1 ton.
[12] Weight not recorded.
[13] Total weight of columbite-tantalite plus $(Cb\text{–}Ta)_2O_5$ content of euxenite
[14] Total value adjusted to eliminate duplicating value of stone.
[15] Total has been adjusted to eliminate duplicating value of raw materials used in manufacturing cement and/or lime.
[16] Less than 1,000 long tons.
[17] Excludes quantity consumed by American Chrome Co.
[18] Recoverable zinc valued at the yearly average price of Prime Western slab zinc, East St. Louis market. Represents value established after transportation, smelting, and manufacturing charges have been added to the value of ore at mine.
[19] Beginning with 1958 slate included with stone.
[20] Millstones only.
[21] Grinding pebbles and tube-mill liners.
[22] Less than 1,000 troy ounces.
[23] Final figure; supersedes figure given in commodity chapter.

| Miscellaneous [3].....do | 25 | 333 | 76 | 631 |

[1] Revised figure.
[2] Adjusted by Bureau of Mines.
[3] Data known to be not comparable with prior years.
[4] Weight not recorded.
[5] Data covers some quantities furnished by Potash Institute; values adjusted by Bureau of Mines.
[6] Includes naphtha but excludes benzol, 1959—1,365,152 barrels ($13,782,172); 1960—907,791 barrels ($9,182,736).
[7] Includes quantities imported free of duty for supplies of vessels and aircraft.
[8] Includes quantities imported free for manufacture in bond and export and for supplies of vessels and aircraft.
[9] Final figure; supersedes figure given in commodity chapter.

Compiled by Mae B. Price and Elsie D. Jackson, Division of Foreign Activities, Bureau of Mines, from records of the U.S. Department of Commerce, Bureau of the Census.

# Employment and Injuries in the Mineral Industries

By John C. Machisak[1]

THIS CHAPTER of the Minerals Yearbook (Volume III) contains overall injury experience and accompanying employment data for coal mines (both bituminous and anthracite), coke plants, petroleum and natural gas, and peat; metal mines, their ore-dressing plants, and the primary nonferrous reduction plants and refineries, which, when combined, make the metallurgical plants; nonmetal mines; sand and gravel operations; nonmetal mills; stone quarries and related plants; and iron blast-furnace slag plants. Volume I of the yearbook contains a chapter showing injury experience and employment data treated separately by metal mines, nonmetal mines, and quarries, together with their milling operations and related plants. Volume II contains injury experience and employment data in the fuel industries (coal, coke, petroleum and natural gas, and peat). The canvass of mineral operations for their injury and employment experience conducted by the Bureau of Mines is on a voluntary basis for all industries except coal. The law requires coal to be reported. The text and tables in this chapter are a result of the replies to this canvass.

Preliminary figures for all mineral industries included in this chapter indicate improvement in the safety record. A decline of 14 percent in man-hours worked did not materially affect the overall combined (fatal and nonfatal) injury-frequency rate of 17.35 per million man-hours for 1960, when compared with the 17.47 rate for the preceding year. An indication of fewer men working is shown by a 15-percent decline in preliminary figures reported. The average employee worked 2,000 hours in 1960, and 1,984 hours the preceding year—an increase of approximately 1 percent.

One major disaster (a single accident in which five or more men are killed) occurred in the mineral industries in 1960. Eighteen men died of asphyxiation following a mine fire in a bituminous coal mine in West Virginia.

**Work Stoppages.**—The Bureau of Labor Statistics reported 158 work stoppages in 1960, totaling 751,000 man-days of work lost, a decline from the preceding year of 25 percent in work stoppages and 88 percent in man-days lost. The bituminous-coal-mining industry reported 120 work stoppages in 1960; anthracite mines had 6. Days lost were 137,000 and 9,000, respectively. The crushed and broken stone industry had 13 stoppages during the year, and lost 104,000 man-days of work. The remaining 19 work stoppages (12 percent) and the approximately 501,000 man-days lost (67 percent) occurred in the petroleum,

**TABLE 1.—Salient statistics of injury experience and employment data in the mineral industries of the United States, by industry groups—Continued**

| | 1956 | 1957 | 1958 | 1959 | 1960 [1] |
|---|---|---|---|---|---|
| Number of injuries: | | | | | |
| Fatal: | | | | | |
| Coal mines | 448 | 478 | 358 | 293 | 326 |
| Coke plants | 10 | 12 | 5 | 3 | 3 |
| Petroleum and natural gas [7] | 147 | 121 | 116 | 120 | 82 |
| Peat [3] | | | | 1 | |
| Metal mines | 89 | 71 | 70 | 65 | 73 |
| Nonmetal mines (except stone quarries) | 17 | 9 | 15 | 12 | 19 |
| Sand and gravel operations [4] | | 35 | 25 | 21 | 23 |
| Stone quarries | 50 | 53 | 45 | 52 | 38 |
| Slag (iron blast-furnace) [5] | | | 1 | 1 | |
| Metallurgical plants | 20 | 21 | 12 | 11 | 11 |
| Nonmetal mills [6] | 7 | 10 | 9 | 11 | 13 |
| Total | 788 | 810 | 656 | 590 | 588 |
| Nonfatal: | | | | | |
| Coal mines | 19,816 | 18,792 | 14,160 | 12,163 | 11,851 |
| Coke plants | 301 | 244 | 210 | 222 | 223 |
| Petroleum and natural gas [7] | 11,372 | 11,426 | 11,588 | 10,543 | 9,110 |
| Peat [3] | | 5 | 12 | 14 | 24 |
| Metal mines | 5,475 | 4,554 | 3,499 | 3,281 | 3,392 |
| Nonmetal mines (except stone quarries) | 1,036 | 1,112 | 955 | 1,072 | 889 |
| Sand and gravel operations [4] | | 1,763 | 1,698 | 2,161 | 1,004 |
| Stone quarries | 3,754 | 4,210 | 4,572 | 4,790 | 3,223 |
| Slag (iron blast-furnace) [5] | | | 43 | 43 | 34 |
| Metallurgical plants | 2,543 | 2,280 | 1,698 | 1,305 | 1,251 |
| Nonmetal mills [6] | 1,157 | 1,512 | 1,490 | 2,156 | 1,246 |
| Total | 45,454 | 45,898 | 39,925 | 37,750 | 32,247 |
| Injury rates per million man-hours: | | | | | |
| Fatal: | | | | | |
| Coal mines | 1.03 | 1.17 | 1.11 | 0.99 | 1.20 |
| Coke plants | .18 | .21 | .11 | .07 | .07 |
| Petroleum and natural gas [7] | .12 | .09 | .10 | .10 | .08 |
| Peat [3] | | | | 1.36 | |
| Metal mines | .62 | .50 | .64 | .65 | .67 |
| Nonmetal mines (except stone quarries) | .50 | .24 | .43 | .33 | .63 |
| Sand and gravel operations [4] | | .59 | .27 | .19 | .47 |
| Stone quarries | .28 | .29 | .24 | .26 | .26 |
| Slag (iron blast-furnace) [5] | | | .26 | .27 | |
| Metallurgical plants | .12 | .13 | .10 | .09 | .10 |
| Nonmetal mills [6] | .17 | .17 | .13 | .12 | .20 |
| Total | .34 | .34 | .30 | .27 | .31 |
| Nonfatal: | | | | | |
| Coal mines | 45.69 | 46.04 | 43.94 | 41.09 | 43.56 |
| Coke plants | 5.32 | 4.26 | 4.62 | 5.09 | 4.84 |
| Petroleum and natural gas [7] | 9.20 | 8.83 | 9.53 | 8.90 | 8.57 |
| Peat [3] | | 21.68 | 17.05 | 18.97 | 27.72 |
| Metal mines | 37.91 | 32.03 | 31.95 | 32.62 | 31.05 |
| Nonmetal mines (except stone quarries) | 30.50 | 29.36 | 27.56 | 29.27 | 29.38 |
| Sand and gravel operations [4] | | 29.50 | 18.37 | 19.68 | 20.37 |
| Stone quarries | 21.06 | 22.96 | 24.47 | 24.03 | 21.83 |
| Slag (iron blast-furnace) [5] | | | 11.30 | 11.68 | 9.41 |

| Nonmetal mills [6] | 28.44 | 25.30 | 20.94 | 23.77 | 19.51 |
| Total | 19.81 | 19.05 | 18.08 | 17.20 | 17.04 |

[1] Preliminary figures, except anthracite, coke, petroleum and natural gas, and slag.
[2] Men at work each day mine was active.
[3] Peat canvass included beginning 1957.
[4] Sand and gravel canvass included beginning 1957.
[5] Slag (iron blast-furnace) canvass included beginning 1958.
[6] Clay included with nonmetal mills beginning 1956.
[7] Includes officeworkers as separate data are not available.
[8] Data not available.
[9] Data will not necessarily add to total due to rounding.

| Asphalt—do | 6,982 | 17,043 | 6,257 | 14,379 |
| Miscellaneous [7]—do | 25 | 333 | 76 | 631 |

[1] Revised figure.
[2] Adjusted by Bureau of Mines.
[3] Data known to be not comparable with prior years.
[4] Weight not recorded.
[5] Data covers some quantities furnished by Potash Institute; values adjusted by Bureau of Mines.
[6] Includes naphtha but excludes benzol, 1959—1,365,152 barrels ($13,782,172); 1960—907,791 barrels ($9,182,726).
[7] Includes quantities imported free of duty for supplies of vessels and aircraft.
[8] Includes quantities imported free for manufacture in bond and export and for supplies of vessels and aircraft.
[9] Final figure; supersedes figure given in commodity chapter.

Compiled by Mae B. Price and Elsie D. Jackson, Division of Foreign Activities, Bureau of Mines, from records of the U.S. Department of Commerce, Bureau of the Census.

**TABLE 8.—U.S. imports for consumption of principal minerals and products—Continued**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Coal, petroleum, and related products—Continued | | | | |
| Petroleum: | | | | |
| Crude thousand barrels | [1] 384,597 | [1] $872,606 | 400,846 | $895,036 |
| Gasoline [4] do | [1] 21,176 | [1] 73,310 | 18,870 | 62,653 |
| Kerosine [7] do | 125 | 536 | 70 | 224 |
| Distillate oil [5] do | [1] 14,756 | [1] 61,418 | 9,792 | 30,958 |
| Residual oil [6] do | [1] 223,414 | [1] 454,476 | 230,306 | 482,112 |
| Unfinished oils do | [1] 23,127 | [1] 65,801 | 20,430 | 55,847 |
| Asphalt do | 6,982 | 17,043 | 6,257 | 14,379 |
| Miscellaneous [7] do | 25 | 333 | 76 | 631 |

[1] Revised figure.
[2] Adjusted by Bureau of Mines.
[3] Data known to be not comparable with prior years.
[4] Weight not recorded.
[5] Data covers some quantities furnished by Potash Institute; values adjusted by Bureau of Mines.
[6] Includes naphtha but excludes benzol, 1959—1,365,152 barrels ($13,782,172); 1960—907,791 barrels ($9,182,726).
[7] Includes quantities imported free of duty for supplies of vessels and aircraft.
[8] Includes quantities imported free for manufacture in bond and export and for supplies of vessels and aircraft.
[9] Final figure; supersedes figure given in commodity chapter.

Compiled by Mae B. Price and Elsie D. Jackson, Division of Foreign Activities, Bureau of Mines, from records of the U.S. Department of Commerce, Bureau of the Census.

**TABLE 9.—U.S. exports of principal minerals and products**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Metals: | | | | |
| Aluminum: | | | | |
| Ingots, slabs, crude short tons | [1] 121,305 | [1] $53,619 | 284,979 | $128,199 |
| Scrap do | [1] 32,164 | [1] 10,384 | 79,513 | 26,905 |

# Employment and Injuries in the Mineral Industries

By John C. Machisak[1]

THIS CHAPTER of the Minerals Yearbook (Volume III) contains overall injury experience and accompanying employment data for coal mines (both bituminous and anthracite), coke plants, petroleum and natural gas, and peat; metal mines, their ore-dressing plants, and the primary nonferrous reduction plants and refineries, which, when combined, make the metallurgical plants; nonmetal mines; sand and gravel operations; nonmetal mills; stone quarries and related plants; and iron blast-furnace slag plants. Volume I of the yearbook contains a chapter showing injury experience and employment data treated separately by metal mines, nonmetal mines, and quarries, together with their milling operations and related plants. Volume II contains injury experience and employment data in the fuel industries (coal, coke, petroleum and natural gas, and peat). The canvass of mineral operations for their injury and employment experience conducted by the Bureau of Mines is on a voluntary basis for all industries except coal. The law requires coal to be reported. The text and tables in this chapter are a result of the replies to this canvass.

Preliminary figures for all mineral industries included in this chapter indicate improvement in the safety record. A decline of 14 percent in man-hours worked did not materially affect the overall combined (fatal and nonfatal) injury-frequency rate of 17.35 per million man-hours for 1960, when compared with the 17.47 rate for the preceding year. An indication of fewer men working is shown by a 15-percent decline in preliminary figures reported. The average employee worked 2,000 hours in 1960, and 1,984 hours the preceding year —an increase of approximately 1 percent.

One major disaster (a single accident in which five or more men are killed) occurred in the mineral industries in 1960. Eighteen men died of asphyxiation following a mine fire in a bituminous coal mine in West Virginia.

**Work Stoppages.**—The Bureau of Labor Statistics reported 158 work stoppages in 1960, totaling 751,000 man-days of work lost, a decline from the preceding year of 25 percent in work stoppages and 88 percent in man-days lost. The bituminous-coal-mining industry reported 120 work stoppages in 1960; anthracite mines had 6. Days lost were 137,000 and 9,000, respectively. The crushed and broken stone industry had 13 stoppages during the year, and lost 104,000 man-days of work. The remaining 19 work stoppages (12 percent) and the approximately 501,000 man-days lost (67 percent) occurred in the petroleum,

iron, copper, lead-zinc, ferroalloy metal ores, miscellaneous metal ores, dimension stone, sand and gravel, and chemical- and fertilizer-mineral-mining industries and in the hydraulic cement industry. The ferroalloy metal ores industry lost less than 1,000 man-days during the year.

## NATIONAL SAFETY COMPETITION

The National Safety Competitions, sponsored and conducted annually by the Bureau of Mines, stimulated great interest among the Nation's mineral-extractive industries and encouraged the development of more effective accident-prevention programs by according national recognition to operations achieving outstanding safety records. Of the 1,127 operations participating in the 1960 competitions, 519 (46 percent) were injury-free—the greatest number in any single year. These 519 injury-free operations worked almost 38 million man-hours (23 percent) of the total exposure to occupational hazards.

Of the five competitions conducted by the Bureau of Mines, two were sponsored by the Bureau. They were the National Safety and National Sand and Gravel Competitions. In these 2 contests, 401 operations (46 percent) finished the competition year free of disabling work injuries. These 401 operations accounted for 29,886,425 man-hours (22 percent) of the total man-hours worked (136,622,630) by all participating operations in these 2 Bureau-conducted competitions.

In addition, the Bureau of Mines conducted three other annual competitions, cosponsored by national associations connected with the mineral industries—the National Crushed Stone Association, National Lime Association and National Slag Association. During 1960, 264 plants participated in the association-sponsored contests, of which 118 (45 percent) attained injury-free records during an aggregate worktime of almost 8 million man-hours. These injury-free man-hours accounted for 30 percent of the total man-hours worked by all plants participating in these competitions.

Trophy awards for the best safety records in each of the six groups in the 1960 National Safety Competition were made to the following:

**Anthracite Underground Mines.**—The Huber Colliery of Glen Alden Corporation, Ashley, Pa.

**Bituminous-Coal Underground Mines.**—The Columbia mine of Columbia-Geneva Steel Division, U.S. Steel Corp., Columbia, Utah.

**Metal Underground Mines.**—Jefferson City mine of Tennessee Coal and Iron Division, U.S. Steel Corp., Jefferson City, Tenn.

**Nonmetal Underground Mines.**—Jonathan mine of Columbia Cement Corporation, Zanesville, Ohio.

**Open-Pit Mines.**—Monroe No. 12 mine of Oliver Iron Mining Division, U.S. Steel Corp., Chisholm, Minn.

**Quarries.**—Calcite quarry of Michigan Limestone Division, U.S. Steel Corp., Rogers City, Mich.

# The Mineral Industry of Alabama

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Geological Survey of Alabama.**

By Avery H. Reed, Jr.[1] and P. E. Lamoreaux[2]

RECORD production of crushed limestone, crude petroleum, marble, miscellaneous clay, salt, scrap mica, kaolin, and talc occurred in Alabama in 1960. Among the States, Alabama ranked second in production of bauxite and third in output of iron ore and native asphalt, and fourth in scrap mica.

Alabama's mineral industry was dominated by the mining and processing of coal and iron ore, which furnished 53 percent of the total value of production, compared with 51 percent in 1959. Other important industries were cement manufacturing, crude petroleum production, and stone quarrying. Leading companies were Tennessee Coal & Iron (coal, iron ore, crushed limestone, and lime), Southern Cement Co. (cement, lime, crushed limestone, and miscellaneous clay), Woodward Iron Co. (coal and iron ore), Alabama By-Products Corp. (coal), Southeastern Electric Generating Co. (coal), and Alabama Power Co. (coal).

**TABLE 1.—Mineral production in Alabama[1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Cement: | | | | |
| Masonry thousand 376-pound barrels | 1,820 | $6,967 | 1,576 | $6,564 |
| Portland do | 12,998 | 39,672 | 11,355 | 36,142 |
| Clays[3] thousand short tons | 1,786 | 2,089 | 1,840 | 2,170 |
| Coal do | 11,947 | 78,212 | 13,011 | 92,439 |
| Gem stones | (2) | (4) | | |
| Iron ore (usable) thousand long tons, gross weight | 4,165 | 23,922 | 4,068 | 23,511 |
| Lime thousand short tons | 579 | 6,847 | 564 | 6,912 |
| Mica (sheet) pounds | 818 | 7 | (2) | (4) |
| Natural gas million cubic feet | 172 | 17 | 57 | 4 |
| Petroleum (crude) thousand 42-gallon barrels | 5,524 | (2) | [6] 7,257 | (4) |
| Sand and gravel thousand short tons | 4,352 | 4,594 | 4,359 | 4,759 |
| Stone[7] do | 11,886 | 18,728 | 13,503 | 19,970 |
| Value of items that cannot be disclosed: Asphalt (native), bauxite, slag cement, clay (kaolin), mica (scrap), salt, stone (dimension limestone, dimension marble, oystershell, and crushed sandstone), talc, and values indicated by footnote 5 | | 25,401 | | 29,441 |
| Total, Alabama[8] | | 200,847 | | 217,617 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Excludes kaolin; included with "Value of items that cannot be disclosed."
[3] Weight not recorded.
[4] Less than $1,000.
[5] Figure withheld to avoid disclosing individual company confidential data.
[6] Preliminary figure.
[7] Excludes certain stone; included with "Value of items that cannot be disclosed."
[8] Total adjusted to eliminate duplicating value of clays and stone.

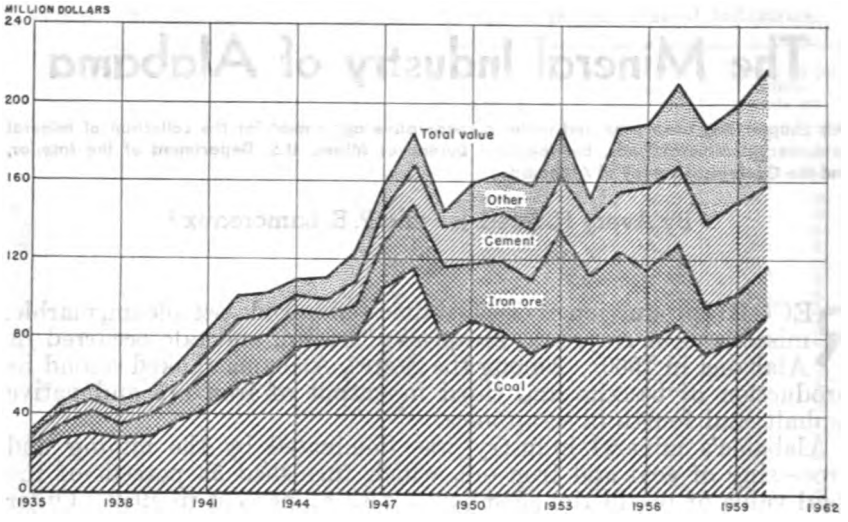

FIGURE 1.—Value of coal, iron ore, cement, and total value of mineral production in Alabama, 1935–60.

Value of mineral production increased 8 percent over 1959 and was 4 percent above 1957, the previous record year. The gain was due to substantial increases in the production of coal, petroleum, and stone.

**Employment and Injuries.**—Total employment in the mineral industries increased 2 percent over 1959, owing mainly to increases of 7 percent in employment at coal mines, and 8 percent at metal mines. Employment at quarries and mills decreased 13 percent because output of cement and lime was smaller.

Injury-frequency rate improved to a record low of 12 injuries per million man-hours. There were 18 fatalities, compared with 9 in 1959.

**Trends and Developments.**—Construction was nearing completion on two new steam units and on the first units in two new hydroelectric plants, all scheduled to begin operation in 1961; these units were: Crist Steam Plant, Unit No. 5, 75,000 kilowatts, Gulf Power Co.; The SEGCO Steam Plant, Unit No. 3, 250,000 kilowatts, Southern Electric Generating Co.; the Weiss Dam, Units No. 1 and No. 2, 58,500 kilowatts, Alabama Power Co.; and the Smith Dam, Unit No. 1, 78,750 kilowatts, Alabama Power Co.

Imports of foreign iron ore exceeded production of red iron ore for the second consecutive year.

**Legislation and Government Programs.**—The National System of Interstate and Defense Highways Program was again responsible for increased production of crushed limestone.

The Bureau of Mines Tuscaloosa Metallurgy Research Center continued work on various research projects of national and regional importance.

# REVIEW BY MINERAL COMMODITIES

## MINERAL FUELS

**Asphalt (Native).**—Alabama Asphaltic Limestone Co. (Margerum quarry) crushed bituminous limestone in Colbert County for roadstone; production decreased 12 percent. Among the States, Alabama ranked third in output of native asphalt.

**Coal.**—Bituminous coal was mined at 177 mines in 10 counties, compared with 187 mines in 10 counties in 1959. Leading counties were Jefferson, Walker, and Tuscaloosa. Leading companies were Tennessee Coal & Iron, Alabama By-Products Corp., Southeastern Electric Generating Co., Alabama Power Co., and Woodward Iron Co., which together supplied 61 percent of the State's total. Production increased 9 percent above 1959 but was 38 percent below 1926, the record year. Average output per mine increased from 63,900 tons in 1959 to 73,500 tons in 1960.

Underground mines produced 79 percent of the total, strip mines, 10 percent, and auger mines, 1 percent. Eighty-four percent of the coal was shipped by rail or water, 11 percent by conveyor belt, and 5 percent by truck. Captive tonnage was 45 percent of the total, compared with 56 percent in 1959.

Equipment used at 135 underground mines included 237 cutting machines, which cut 71 percent of the tonnage; 250 power drills, which drilled 72 percent; 297 locomotives; 220 shuttle cars; 23 rope hoists; and 79 mother conveyors.

Equipment used at 39 strip mines included 77 power shovels, 16 draglines, 7 carryall scrapers, 57 bulldozers, 37 power drills, and 117 trucks. An estimated 39,700,000 cubic yards of overburden was excavated.

Digitized by Google

Three coal-recovery augers and two trucks were used at three auger mines.

TABLE 3.—Coal production by counties

| County | 1959 | | 1960 | |

**Coke.**—Six companies produced byproduct metallurgical coke at seven plants in Jefferson, Etowah, and Tuscaloosa Counties. Leading coke producers were Tennessee Coal & Iron and U.S. Pipe & Foundry Co.

**Natural Gas.**—Marketed production of natural gas from Marion County decreased substantially compared with 1959.

**Petroleum.**—Production of crude petroleum increased 31 percent and was 23 percent above 1958, the previous record year. Leading counties were Mobile and Escambia. During the year, 40 new producing wells were drilled. The 384 producing wells were in the following counties: Baldwin 6, Choctaw 69, Clarke 13, Escambia 36, and Mobile 260.

Jett Drilling Co., Inc., entered into a multimillion-dollar drilling deal with Ancora Corp., involving at least 100 new holes in the Citronelle oilfield. More than 4,000 acres were involved, much of it on the undeveloped east flank of the field.

## NONMETALS

**Cement.**—Seven companies produced masonry cement at eight plants in four counties. Leading producers were Southern Cement Co. and National Cement Co. Shipments decreased 13 percent and were 19

Digitized by Google

percent below 1955, the record year. Consumption of masonry cement in Alabama amounted to 21 percent of shipments. Out-of-State shipments were made to Georgia (30 percent), South Carolina (12 percent), North Carolina (9 percent), Florida (8 percent), Louisiana (8 percent), Mississippi (7 percent), Tennessee (3 percent), and other States (2 percent).

Seven companies produced portland cement at eight plants in five counties. Leading producers were Southern Cement Co. (Calera plant) and Ideal Cement Co. (Mobile plant). Shipments decreased 13 percent below 1959, the record year. Shipments of portland cement to Alabama consumers amounted to 40 percent. The remaining shipments were made to Georgia (21 percent), Florida (15 percent), Mississippi (9 percent), South Carolina (7 percent), Louisiana (3 percent), North Carolina (2 percent), Tennessee (2 percent), and other States (1 percent). Raw materials used in manufacturing portland cement included limestone and oystershell (46 percent), cement rock (34 percent), clay and shale (13 percent), and other materials (7 percent).

End uses of portland cement were as follows: Ready-mixed concrete (53 percent), concrete-products manufacturers (20 percent), highway contractors (13 percent), building-materials dealers (8 percent), and other uses (6 percent).

Southern Cement Co. and Cheney Lime & Cement Co. produced slag cement. Shipments were 12 percent below 1959 and 74 percent below 1952, the record year.

Annual capacity of portland cement plants increased from 16,273,000 to 16,340,000 barrels.

Clays.—Twenty-one companies mined 1,549,000 tons of miscellaneous clay at 23 mines in 12 counties for portland cement and heavy clay products. Leading producers were Southern Cement Co. and Jenkins Brick Co. Production increased 3 percent over 1959, the previous record year.

Nine companies mined fire clay at 10 mines in 7 counties. Leading producers were Donoho Clay Co. and Russell Coal & Clay Co. Production increased 5 percent but was 4 percent below 1956, the record year. Dixie Fire Brick Co., subsidiary of A. P. Greene Fire Brick Co., completed a $100,000 modernization program at Kimberley; the main products of the plant were ladle brick and fire clay brick.

Harbison-Walker Refractories Co. and Thomas Alabama Kaolin Co. mined kaolin for floor and wall tile, firebrick and block, paper filling, fertilizer, and insecticides. Production increased 39 percent above 1959, the previous record year.

Lime.—Six companies produced quicklime and hydrated lime at seven plants in Jefferson and Shelby Counties for building, agricultural, refractory, chemical, and industrial uses. Leading producers were Southern Cement Co. (Roberta and Keystone limekilns) and Longview Lime Corp. Production decreased 3 percent below 1959, the record year. Shipments of lime to consumers in Alabama amounted to 57 percent. The remaining shipments were made to Florida (17 percent), Georgia (13 percent), Mississippi (4 percent),

[1] Includes railroad ballast and other gravel.

**Stone.**—Thirty-five companies crushed limestone at 40 quarries in 18 counties. Leading counties were Shelby, Jefferson, and Madison. Leading producers were Birmingham Slag Co., Lone Star Cement Corp., and Southern Cement Co. Production increased 14 percent over 1959, the previous record year. Of the total production, 60 percent was shipped by truck, 26 percent by rail, 9 percent by conveyor belt, and 5 percent by water.

Digitized by Google

Alabama Limestone Co. quarried dimension limestone in Franklin County for rubble, rough architectural, sawed and cut dressed building stone, and for curbing and flagging. Production decreased 4 percent and was 39 percent below 1956, the record year.

Thompson-Weinman & Co., Moretti-Harrah Marble Co., and Alabama Marble Co. crushed marble at Sylacauga for whiting, terrazzo, and other uses. Production increased 2 percent over 1959, the previous record year.

Moretti-Harrah Marble Co. and Alabama Marble Co. quarried dimension marble for rough interior, sawed interior, and cut exterior and interior dressed building stone, and for cut dressed monumental stone. Production was about the same as in 1958, the previous record year.

Southern Oystershell Milling Corp. and Bay Towing & Dredging Co., Inc., crushed oystershell from Mobile Bay for poultry grit and for roadstone. Production increased 5 percent but was 50 percent below 1957, the record year.

Universal Atlas Cement Co. and Sam P. Acton crushed sandstone for cement and refractories. Production decreased 11 percent and was 87 percent below 1956, the record year.

A. O. Brown quarried dimension sandstone for rough architectural building stone. Production increased 10 percent but was 90 percent below 1954, the record year.

Talc.—American Talc Co. mined and ground talc in Winterboro for insecticides, paint, textiles, and toilet preparations. Production increased 12 percent over 1959, the previous record year.

[2] Includes alkali, paper, refractory, other uses, and uses indicated by footnote 1.

**Vermiculite.**—Zonolite Co. exfoliated vermiculite at its plant in Birmingham, using vermiculite from out of State.

## METALS

**Aluminum.**—Reynolds Metals Co. operated the Listerhill aluminum reduction plant in Sheffield.

**Bauxite.**—R. E. Wilson Mining Co., D. M. Wilson Bauxite Co., and Harbison-Walker Refractories Co. mined crude bauxite in Barbour and Henry Counties. Production decreased 4 percent. Alabama ranked second in bauxite production.

**Ferroalloys.**—Shipments of ferromanganese, silicomanganese, ferrosilicon, and ferrophosphorus totaled 156,000 short tons valued at $28,710,000.

**Gold and Silver.**—There had been no production of gold and silver in Alabama since 1946. Table 11 shows the production of gold and silver, 1830–1960. The history of gold mining in Alabama has involved mainly the working of the small streams in the gold-bearing area and the operation of one large gold mine. The greatest period of activity was from the discovery of gold in 1830 through 1849, when gold was discovered in California and the Alabama gold miners dropped their picks and joined the gold rush. There was sporadic placer mining at various times after that, but the production was small. In 1905, the Hog Mountain mine in Tallapoosa County opened, a cyanide mill was constructed, and several hundred feet of sinking and drifting were done. The mine operated until 1914, was idle from 1915 to 1934, and again operated from 1934 through 1937. This one mine furnished about half of the total gold and silver production of the State. Production since 1937, all from placer operations, has been very small.

| Tallapoosa | 23,916 | 668,222 | 4,286 | 2,860 | 28,202 | 671,082 |
| Undistributed | 23,943 | 494,869 | 993 | 1,154 | 24,936 | 496,023 |
| Total | 49,500 | 1,198,985 | 5,678 | 4,267 | 55,178 | 1,203,252 |

**Iron Ore.**—Shipments of iron ore decreased 2 percent and were 54 percent below 1942, the record year. Of the total shipments, 52 percent were direct-shipping ore, compared with 50 percent in 1959. The number of active mines decreased from 35 to 31, and average usable production per mine increased from 119,000 to 137,000 tons. Alabama ranked third among the States in iron ore production. Cumulative shipments since 1840 totaled 358,180,000 long tons valued at $927,255,000.

Four companies mined red iron ore (hematite) at four mines in Jefferson and Tuscaloosa Counties. Leading producers were Tennessee Coal & Iron (Wenonah mine) and Woodward Iron Co. (Pyne mine). Production increased 14 percent but was 58 percent below 1942, the record year.

Twenty operators mined brown iron ore (limonite) for iron and steel at 27 mines in 10 counties. Leading counties were Franklin and Pike. Leading producers were Shook & Fletcher Supply Co. (Taits Gap, Blackburn, and Adkins mines), U.S. Pipe & Foundry Co. (Russellville No. 15 mine), and Glenwood Mining Co., Inc. (Greenville, Glenwood, and Springhill mines). Shipments decreased 36 percent and were 56 percent below 1942, the record year.

**Magnesium.**—Alabama Metallurgical Corp. manufactured magnesium from dolomite at Selma.

**TABLE 13.—Usable iron ore shipments, by counties**

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Long tons | Value | Long tons | Value |
| Barbour | 52,617 | $252,373 | 77,068 | $398,914 |
| Blount | (1) | (1) | (1) | (1) |
| Butler | 273,463 | 1,439,200 | 188,873 | 1,209,393 |

**TABLE 14.—Mine production and shipments of crude iron ore**

| | 1959 | | 1960 | |
|---|---|---|---|---|
| | Number of mines | Long tons | Number of mines | Long tons |
| Mine production: | | | | |
| By varieties: | | | | |
| Hematite | 6 | 3,194,935 | 4 | 3,317,487 |
| Limonite | 29 | 4,251,353 | 27 | 3,851,000 |
| By mining methods: | | | | |
| Open pit | 31 | 4,363,792 | 28 | 4,014,369 |
| Underground | 4 | 3,082,396 | 3 | 3,154,118 |
| Shipments from mines: | | | | |
| Direct to consumers | 6 | 2,088,390 | 4 | 2,097,317 |
| To beneficiation plants | 29 | 5,351,140 | 27 | 5,060,966 |

**TABLE 15.—Usable iron ore production and shipments**

| | 1959 | | 1960 | |
|---|---|---|---|---|
| | Long tons | Iron content, natural (percent) | Long tons | Iron content, natural (percent) |
| Production: | | | | |
| Hematite | 2,863,278 | 36 | 3,206,911 | 37 |
| Limonite | 1,392,046 | 46 | 1,028,548 | 45 |
| Shipments: | | | | |
| Direct shipping ore | 2,088,390 | 36 | 2,097,317 | 37 |
| Concentrates and sinter | 2,076,934 | 42 | 1,970,367 | 45 |

**Pig Iron and Steel.**—Tennessee Coal & Iron, U.S. Pipe & Foundry Co., Republic Steel Corp., and Woodward Iron Co. produced 3,545,000 tons of foundry, basic, low-phosphorus, direct-casting, and malleable pig iron, compared with 3,658,000 tons in 1959. Value of shipments was $200,366,000, compared with $206,450,000 in 1959. Iron ore consumed in blast furnaces, steel mills, and agglomerating plants was 68 percent domestic and 32 percent imported. Imports of iron ore, mainly from Venezuela and Chile, decreased 29 percent below 1959, the record year.

Woodward Iron Co. announced plans to build an ore sintering plant in Woodward, Ala., as part of a $2 million program.

## REVIEW BY COUNTIES

Mineral production was reported from 47 of the State's 67 counties, compared with 51 in 1959. Leading counties were Jefferson, Mobile, Walker, and Shelby, which together supplied 83 percent of the total value.

**Autauga.**—Dallas Sand & Gravel Co. mined building sand and fluxing gravel.

**Baldwin.**—Production of crude petroleum from 6 oil wells was 16 percent less than in 1959; one new producing well was drilled during the year. Hinote Sand Supply Co. produced a small quantity of building sand and gravel. Fairhope Clay Products Co. mined miscellaneous clay for heavy clay products.

**Barbour.**—H. D. Loflin, Rucker Mining Co., Davis Bros., and Glenwood Mining Co., Inc., mined brown iron ore for iron and steel. R. E.

Digitized by Google

Wilson Mining Co. and D. M. Wilson Bauxite Co. mined bauxite for chemicals and refractories. Harbison-Walker Refractories Co. mined refractory kaolin for firebrick and block; production was nearly double that of 1959. The company planned to construct a plant at Eufaula to eliminate the long haul to Bessemer. McKenzie Construction Co. mined building, paving, railroad ballast, and fill sand, and building gravel.

**TABLE 16.—Value of mineral production in Alabama, by counties [1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Autauga | ---------- | $119,550 | Sand and gravel. |
| Baldwin | (2) | (2) | Petroleum, sand and gravel, miscellaneous clay. |
| Barbour | (2) | (2) | Iron ore, bauxite, kaolin, sand and gravel. |
| Bibb | $118,856 | 90,664 | Coal. |
| Blount | 2,342,146 | 1,626,264 | Coal, iron ore, cement, fire clay, sandstone. |
| Butler | 1,439,200 | 1,209,393 | Iron ore. |
| Calhoun | 482,619 | 568,509 | Sand and gravel, fire clay, iron ore, miscellaneous clay. |
| Cherokee | (2) | (2) | Limestone, iron ore, sand and gravel. |
| Chilton | (2) | 164,700 | Sand and gravel. |

**Bibb.**—Four mines produced coal; the leading producers were W. E. Meacham Coal Co. (Belle Ellen No. 11 mine) and Blocton Coal Co. (Belle Ellen No. 9 mine).

**Blount.**—Five mines produced coal; leading producers were Alabama Coal & Ore Co., Inc. (Hopewell strip mine), and Robbins Coal Co., Inc. (Southview strip mine). Shook & Fletcher Supply Co. (Taits Gap mine) mined brown iron ore for iron and steel. Cheney Lime & Cement Co. produced masonry and slag cements at the Graystone mill. Harbison-Walker Refractories Co. (Thermal mine) and Lehigh Coal Co. (Lehigh mine) produced fire clay for firebrick and block and for other refractories. A. O. Brown quarried a small quantity of dimension sandstone for rough architectural building stone.

**Butler.**—Six companies mined brown iron ore for iron and steel; leading producers were Pigeon Creek Mining Co. and Woodward-Acree Mining Co. Total production of brown iron ore, 1929–60, was 1,194,000 tons.

**Calhoun.**—Wade Sand & Gravel Co., Inc., and John B. Lagarde, Inc., mined building sand and gravel. Donoho Foundry Co. mined fire clay for fire-clay mortar. J. E. and F. D. Brown, and Pope & Sublett mined brown iron ore for iron and steel; total production, 1906–60, was 1,355,000 tons. Agricola Brick Co. mined miscellaneous clay for heavy clay products.

**Cherokee.**—A. E. Burgess Co., Inc. and W. S. Fowler Equipment Rental Co. opened new quarries and crushed limestone for riprap and fill. Arrington Mining Co. reopened the Sidhart mine and produced brown iron ore for iron and steel. Wolf Creek Sand Co. mined a small quantity of molding sand.

**Chilton.**—Southeastern Sand-Gravel Co. mined building and paving sand and building and fluxing gravel.

**Choctaw.**—Crude petroleum production from 69 oil wells was 2 percent less than in 1959. One new producing well was drilled during the year.

**Clarke.**—Crude petroleum production from 13 oil wells declined 85 percent; one new producing well was drilled during the year. Paul Sand & Gravel Co. mined a small quantity of building sand and gravel.

**Colbert.**—Tri-State Limestone, Inc., Ralph Rogers & Co., Inc., and Alabama Asphaltic Limestone Co. (Maloney quarry) crushed limestone for roadstone, agstone, railroad ballast, and stone sand. Alabama Asphaltic Limestone (Margerum quarry) mined native asphalt for roadstone.

**Conecuh.**—Conecuh Lime Co., Inc. (Evergreen quarry), crushed limestone for agstone.

**Covington.**—Miller Lime Pit (Florala quarry) crushed limestone for roadstone and agstone.

**Crenshaw.**—McGhee & Merrill Co., Glenwood Mining Co., Inc., and Davis Bros. Mining Co. mined brown iron ore for pig iron and steel; total production, 1939–60, was 779,000 tons.

**Cullman.**—Six mines produced coal; leading producers were Marigold Coal, Inc. (No. 2 Strip mine), and H. E. Drummond Coal Co., Inc. (Drummond Strip mine).

**Dallas.**—C. Pierson Cosby and Dallas Sand & Gravel Co., Inc., mined building, paving, molding, railroad ballast, and fill sand, and building, paving, filter, railroad ballast, and fluxing gravel.

Digitized by Google

**De Kalb.**—Pearsall Limestone, Inc., crushed limestone for concrete and roads.

**Elmore.**—Alabama Gravel Co. and Birmingham Slag Co. mined building and paving sand and building and fluxing gravel. Jenkins Brick Co. mined miscellaneous clay for heavy clay products.

**Escambia.**—Crude petroleum production from 36 oil wells decreased 10 percent below 1959; no new producing wells were drilled during the year. Dixie Sand & Gravel Co. and Flomaton Gravel Co. mined building and paving sand and gravel. Keego Clay Products Co. mined miscellaneous clay for heavy clay products.

**Etowah.**—Alabama Aggregate Co. and Double R. Co. crushed limestone for concrete and roads, raprap, agstone, and fluxing stone.

**Franklin.**—Alabama Limestone Co. quarried dimension limestone for rubble, rought architectural, and sawed and cut building stone. U.S. Pipe & Foundry Co. (Russellville No. 15 mine), Shook & Fletcher Supply Co. (Blackburn mine), and Hester & Farned mined brown iron ore for pig iron and steel; total production, 1902–60, was 7,241,000 tons. Tennessee Valley Sand & Gravel Co. mined building and paving sand and gravel and produced fire clay for fire-clay mortar.

**Greene.**—Akron Sand Co. mined building and paving sand and gravel.

**Henry.**—Harbison-Walker Refractories Co. mined bauxite for refractories. Abbeville Lime Co. crushed limestone for agstone.

**Houston.**—L. C. Smith Sand & Gravel Co. and Speigner Concrete Block Co. mined building and fill sand.

**Jackson.**—The State highway department crushed limestone for concrete and roads. Widows Creek Mining Corp. (Sewannee strip mine) and Reames Coal Co. mined coal.

**Jefferson.**—Seventy-four mines produced coal; leading mines were the Concord No. 1 mine (Tennessee Coal & Iron), the Maxine mine (Alabama By-Products Corp.), and the Edgewater mine (Tennessee Coal & Iron).

Four companies produced portland cement; five companies produced masonry cement, and Southern Cement Co. produced slag cement. Leading producers of portland cement were Universal Atlas Cement Co. (Leeds mill) and Lone Star Cement Corp. (Birmingham mill). Leading producers of masonry cement were Southern Cement Co. (North Birmingham mill) and Lone Star Cement Corp. (Birmingham mill).

Tennessee Coal & Iron (Wenonah mine), Woodward Iron Co. (Pyne mine), and Republic Steel Corp. (Edwards mine) mined red iron ore for pig iron and steel. Total production of red iron ore, 1863–1960, was 298,692,000 tons.

Eight quarries crushed limestone for cement, roadstone, agstone, fluxing stone, rock dust for coal mines, lime, railroad ballast, stone sand, and refractories. Leading producers were Tennessee Coal & Iron (Dolonah quarry), Dolcito Quarry Co. (Dolcito quarry), and Universal Atlas Cement Co. (Leeds quarry).

Tennessee Coal & Iron (Ensley works) produced quicklime for chemical, industrial, and refractory use.

Seven companies mined miscellaneous clay for cement and for heavy clay products. Leading producers were Natco Corp., Universal Atlas Cement Co., and Lehigh Portland Cement Co.

Digitized by Google

Wade & Vance Sand & Gravel Co., Inc., mined building sand and gravel.

Dixie Fire Brick Co., Inc., Bibby Coal, Shale & Clay Co., and W. S. Dickey Clay Co., mined fire clay for firebrick and block, fire-clay mortar, and heavy clay products.

Universal Atlas Cement Co. and Sam P. Acton crushed sandstone for cement and refractories.

Zonolite Co. exfoliated vermiculite at its plant in Birmingham, using materials from out of State.

**Limestone.**—Limestone County Board of Revenue crushed limestone for concrete and roads.

**Macon.**—Sharpe Sand & Gravel Co. and Tri-State Sand Co. mined building, paving and molding sand, and building and paving gravel.

**Madison.**—Madison Limestone Co. (Pluski Pike & Airport quarries) and Alabama Rock Co. crushed limestone for roadstone and agstone. Alabama Brick & Tile Co. and Huntsville Brick & Tile Co., Inc., mined miscellaneous clay for heavy clay products.

**Marengo.**—Lone Star Cement Corp. produced portland cement at the Demopolis mill and crushed limestone for use in making cement.

**Marion.**—Twenty-eight mines produced coal; leading producers were Brookside-Pratt Mining Co. (New River strip mine), Webb Excavating Co. (Brilliant strip mine), and Self & Fowler Coal Co. (No. 3 mine). Thomas Alabama Kaolin Co. (Hackelburg mine) mined kaolin for floor and wall tile, firebrick and block, fillers, and insecticides. Production of natural gas declined 67 percent.

**Marshall.**—C. A. Langford crushed limestone for concrete and roads.

**Mobile.**—Production of crude petroleum from 260 oil wells expanded 43 percent; during the year, 37 new producing wells were drilled. Ideal Cement Co. produced portland cement at the Mobile mill, using oystershell dredged from Mobile Bay, and mined miscellaneous clay for use in making cement. Bay Towing & Dredging Co. and Southern Oystershell Milling Co. dredged oystershell from Mobile Bay for cement, roadstone, and poultry grit. Radcliff Gravel Co., Inc., mined building and paving sand and gravel.

**Monroe.**—Mannings Sand & Gravel Co. mined building sand and gravel.

**Montgomery.**—Five companies mined building and paving sand, and building, paving, and railroad ballast gravel; the leading producer was Birmingham Slag Co. (Conley and Cooks Station mines). Jenkins Brick Co. and Excelsior Brick Co. mined miscellaneous clay for heavy clay products.

**Morgan.**—Waters Construction Co. and Trinity Stone Co., Inc., crushed limestone for riprap, roadstone, agstone, and stone sand. Decatur Sand & Gravel Co. mined building and paving sand and gravel.

**Pike.**—Five mines produced brown iron ore for sale to iron and steel plants. Leading producers were Glenwood Mining Co., Inc. (Spring Hill mine), and Arrington Mining Co. (Brundidge mine).

**Randolph.**—Dixie Mines, Inc. (Dixie mine), mined scrap mica; part of the mica was shipped to Texas, and part was ground by the company and shipped to consumers. J. J. New (New mine) mined a small quantity of sheet mica.

**Russell.**—Bickerstaff Brick Co., Dixie Brick Co., and Bickerstaff Co., Inc., mined miscellaneous clay for heavy clay products. Con-

Digitized by Google

solidated Gravel Co., Inc., mined building, paving, and railroad ballast sand, and building and paving gravel.

**St. Clair.**—National Cement Co. produced masonry and portland cement at the Ragland mill. National Cement Co. and Birmingham Slag Co. crushed limestone for cement, agstone, and roadstone. National Cement Co. and Ragland Brick Co. mined miscellaneous clay for cement and heavy clay products. Riverside Clay Co. (Riverside and Pell City mines) mined fire clay for foundries and steelworks. Wolf Creek Sand Co. mined a small quantity of molding sand.

**Shelby.**—Southern Cement Co. produced masonry and portland cements at the Calera mill. Six limekilns produced quicklime and hydrated lime for agricultural, building, chemical, and industrial uses; leading producers were Southern Cement Co. (Roberta limekiln) and Longview Lime Corp. (Saginaw limekiln). Eight quarries crushed limestone for concrete and roads, agstone, papermills, cement, lime, riprap, fluxing stone, railroad ballast, asphalt filler, rock dust for coal mines, chemicals, and stone sand; leading producers were Birmingham Slag Co. (Calera quarry), Southern Cement Co. (Roberta quarry), and Alabama Aggregates Co. (Pelham quarry). Six mines produced coal; leading producers were River Valley Coal Co. (River Valley No. 8 mine) and Alabama Red Ash Coal Co. (No. 2 mine). Southern Cement Co. mined miscellaneous clay for cement. Shelby Sand & Ore Co. mined brown iron ore for iron and steel; total production, 1890–1960, was 1,592,000 tons. Montevallo Clay Co. mined fire clay for foundries and steelworks.

**Talladega.**—Thompson-Weinman & Co. (Hill quarry), Moretti-Harrah Marble Co., and Alabama Marble Co. crushed marble for terrazzo and other uses. Moretti-Harrah Marble Co. and Alabama Marble Co. quarried dimension marble for rough interior; cut, sawed, and dressed interior; cut and dressed exterior; and cut, dressed monumental stone. American Talc Co. (Winterboro mine) mined a small quantity of talc, and ground it for insecticides, paint, textiles, toilet preparations, and other uses.

**Tuscaloosa.**—Six mines produced coal; leading producers were Twin Seam Mining Co. (Kellerman No. 4 strip mine) and Debardeleben Coal Corp. (River Bank strip mine). Southeastern Coal & Iron Co. mined red iron ore at the Dudley mine, and Shook & Fletcher Supply Co. mined brown iron ore at the Adkins mine for pig iron and steel; total production of iron ore, 1890–1960, was 12,534,000 tons. Yazoo Gravel Co., Inc., Tuscaloosa Sand & Gravel Co., and Shackelford Construction Co. mined building and molding sand, and building gravel.

**Walker.**—Forty-three mines produced coal; leading producers were Southern Electric Generating Co. (Segco No. 1 mine), Alabama Power Co. (Gorgas mine), and Debardeleben Coal Corp. (Waterside strip mine). Russell Coal & Clay Co., Natco Corp., and Aaron Clay Co. mined fire clay for firebrick and block.

**Washington.**—Mathieson Chemical Corp. recovered salt from brine at its plant near McIntosh. Lone Star Cement Corp. crushed limestone and mined miscellaneous clay, which were shipped to Louisiana for use in making cement.

**Winston.**—McCoy Coal Co. mined coal at the Winston strip mine.

Alabama Limestone Co. quarried dimension limestone in Franklin County for rubble, rough architectural, sawed and cut dressed building stone, and for curbing and flagging. Production decreased 4 percent and was 39 percent below 1956, the record year.

Thompson-Weinman & Co., Moretti-Harrah Marble Co., and Alabama Marble Co. crushed marble at Sylacauga for whiting, terrazzo, and other uses. Production increased 2 percent over 1959, the previous record year.

Moretti-Harrah Marble Co. and Alabama Marble Co. quarried dimension marble for rough interior, sawed interior, and cut exterior and interior dressed building stone, and for cut dressed monumental stone. Production was about the same as in 1958, the previous record year.

Southern Oystershell Milling Corp. and Bay Towing & Dredging Co., Inc., crushed oystershell from Mobile Bay for poultry grit and for roadstone. Production increased 5 percent but was 50 percent below 1957, the record year.

Universal Atlas Cement Co. and Sam P. Acton crushed sandstone for cement and refractories. Production decreased 11 percent and was 87 percent below 1956, the record year.

A. O. Brown quarried dimension sandstone for rough architectural building stone. Production increased 10 percent but was 90 percent below 1954, the record year.

Talc.—American Talc Co. mined and ground talc in Winterboro for insecticides, paint, textiles, and toilet preparations. Production increased 12 percent over 1959, the previous record year.

| Total | 11,578,293 | 14,092,812 | 1.22 | 13,189,464 | 15,643,598 | 1.19 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other uses."
[2] Includes alkali, paper, refractory, other uses, and uses indicated by footnote 1.

**Vermiculite.**—Zonolite Co. exfoliated vermiculite at its plant in Birmingham, using vermiculite from out of State.

## METALS

**Aluminum.**—Reynolds Metals Co. operated the Listerhill aluminum reduction plant in Sheffield.

**Bauxite.**—R. E. Wilson Mining Co., D. M. Wilson Bauxite Co., and Harbison-Walker Refractories Co. mined crude bauxite in Barbour and Henry Counties. Production decreased 4 percent. Alabama ranked second in bauxite production.

**Ferroalloys.**—Shipments of ferromanganese, silicomanganese, ferrosilicon, and ferrophosphorus totaled 156,000 short tons valued at $28,710,000.

**Gold and Silver.**—There had been no production of gold and silver in Alabama since 1946. Table 11 shows the production of gold and silver, 1830–1960. The history of gold mining in Alabama has involved mainly the working of the small streams in the gold-bearing area and the operation of one large gold mine. The greatest period of activity was from the discovery of gold in 1830 through 1849, when gold was discovered in California and the Alabama gold miners dropped their picks and joined the gold rush. There was sporadic placer mining at various times after that, but the production was small. In 1905, the Hog Mountain mine in Tallapoosa County opened, a cyanide mill was constructed, and several hundred feet of sinking and drifting were done. The mine operated until 1914, was idle from 1915 to 1934, and again operated from 1934 through 1937. This one mine furnished about half of the total gold and silver production of the State. Production since 1937, all from placer operations, has been very small.

Alabama Limestone Co. quarried dimension limestone in Franklin County for rubble, rough architectural, sawed and cut dressed building stone, and for curbing and flagging. Production decreased 4 percent and was 39 percent below 1956, the record year.

Thompson-Weinman & Co., Moretti-Harrah Marble Co., and Alabama Marble Co. crushed marble at Sylacauga for whiting, terrazzo, and other uses. Production increased 2 percent over 1959, the previous record year.

Moretti-Harrah Marble Co. and Alabama Marble Co. quarried dimension marble for rough interior, sawed interior, and cut exterior and interior dressed building stone, and for cut dressed monumental stone. Production was about the same as in 1958, the previous record year.

Southern Oystershell Milling Corp. and Bay Towing & Dredging Co., Inc., crushed oystershell from Mobile Bay for poultry grit and for roadstone. Production increased 5 percent but was 50 percent below 1957, the record year.

Universal Atlas Cement Co. and Sam P. Acton crushed sandstone for cement and refractories. Production decreased 11 percent and was 87 percent below 1956, the record year.

A. O. Brown quarried dimension sandstone for rough architectural building stone. Production increased 10 percent but was 90 percent below 1954, the record year.

Talc.—American Talc Co. mined and ground talc in Winterboro for insecticides, paint, textiles, and toilet preparations. Production increased 12 percent over 1959, the previous record year.

TABLE 12.—Mine production of gold and silver, 1830–1960, by counties

| County | Gold | | Silver | | Total | |
|---|---|---|---|---|---|---|
| | Troy ounces | Value | Troy ounces | Value | Troy ounces | Value |
| Chilton | 24 | $504 | 14 | $13 | 38 | $517 |
| Clay | 55 | 1,465 | 250 | 165 | 305 | 1,630 |
| Cleburne | 137 | 2,845 | 11 | 5 | 148 | 2,850 |
| Randolph | 100 | 2,666 | 14 | 7 | 114 | 2,673 |
| Talladega | 1,325 | 28,414 | 110 | 63 | 1,435 | 28,477 |
| Tallapoosa | 23,916 | 668,222 | 4,286 | 2,860 | 28,202 | 671,082 |
| Undistributed | 23,943 | 494,869 | 993 | 1,154 | 24,936 | 496,023 |
| Total | 49,500 | 1,198,985 | 5,678 | 4,267 | 55,178 | 1,203,252 |

**Iron Ore.**—Shipments of iron ore decreased 2 percent and were 54 percent below 1942, the record year. Of the total shipments, 52 percent were direct-shipping ore, compared with 50 percent in 1959. The number of active mines decreased from 35 to 31, and average usable production per mine increased from 119,000 to 137,000 tons. Alabama ranked third among the States in iron ore production. Cumulative shipments since 1840 totaled 358,180,000 long tons valued at $927,255,000.

Four companies mined red iron ore (hematite) at four mines in Jefferson and Tuscaloosa Counties. Leading producers were Tennessee Coal & Iron (Wenonah mine) and Woodward Iron Co. (Pyne mine). Production increased 14 percent but was 58 percent below 1942, the record year.

Twenty operators mined brown iron ore (limonite) for iron and steel at 27 mines in 10 counties. Leading counties were Franklin and Pike. Leading producers were Shook & Fletcher Supply Co. (Taits Gap, Blackburn, and Adkins mines), U.S. Pipe & Foundry Co. (Russellville No. 15 mine), and Glenwood Mining Co., Inc. (Greenville, Glenwood, and Springhill mines). Shipments decreased 36 percent and were 56 percent below 1942, the record year.

**Magnesium.**—Alabama Metallurgical Corp. manufactured magnesium from dolomite at Selma.

TABLE 13.—Usable iron ore shipments, by counties

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Long tons | Value | Long tons | Value |
| Barbour | 52,617 | $252,373 | 77,068 | $398,914 |
| Blount | (1) | (1) | (1) | (1) |
| Butler | 273,463 | 1,439,200 | 188,873 | 1,209,393 |

**TABLE 14.—Mine production and shipments of crude iron ore**

| | 1959 | | 1960 | |
|---|---|---|---|---|
| | Number of mines | Long tons | Number of mines | Long tons |
| Mine production: | | | | |
| By varieties: | | | | |
| Hematite | 6 | 3,194,835 | 4 | 3,317,487 |
| Limonite | 29 | 4,251,353 | 27 | 3,851,000 |
| By mining methods: | | | | |
| Open pit | 31 | 4,383,792 | 28 | 4,014,369 |
| Underground | 4 | 3,062,396 | 3 | 3,154,118 |
| Shipments from mines: | | | | |
| Direct to consumers | 6 | 2,088,390 | 4 | 2,097,317 |
| To beneficiation plants | 29 | 5,351,140 | 27 | 5,060,966 |

**TABLE 15.—Usable iron ore production and shipments**

| | 1959 | | 1960 | |
|---|---|---|---|---|
| | Long tons | Iron content, natural (percent) | Long tons | Iron content, natural (percent) |
| Production: | | | | |
| Hematite | 2,803,278 | 36 | 3,206,911 | 37 |
| Limonite | 1,362,046 | 46 | 1,028,548 | 45 |
| Shipments: | | | | |
| Direct shipping ore | 2,088,390 | 36 | 2,097,317 | 37 |
| Concentrates and sinter | 2,076,934 | 42 | 1,970,367 | 45 |

**Pig Iron and Steel.**—Tennessee Coal & Iron, U.S. Pipe & Foundry Co., Republic Steel Corp., and Woodward Iron Co. produced 3,545,000 tons of foundry, basic, low-phosphorus, direct-casting, and malleable pig iron, compared with 3,658,000 tons in 1959. Value of shipments was $200,366,000, compared with $206,450,000 in 1959. Iron ore consumed in blast furnaces, steel mills, and agglomerating plants was 68 percent domestic and 32 percent imported. Imports of iron ore, mainly from Venezuela and Chile, decreased 29 percent below 1959, the record year.

Woodward Iron Co. announced plans to build an ore sintering plant in Woodward, Ala., as part of a $2 million program.

## REVIEW BY COUNTIES

Mineral production was reported from 47 of the State's 67 counties, compared with 51 in 1959. Leading counties were Jefferson, Mobile, Walker, and Shelby, which together supplied 83 percent of the total value.

**Autauga.**—Dallas Sand & Gravel Co. mined building sand and fluxing gravel.

**Baldwin.**—Production of crude petroleum from 6 oil wells was 16 percent less than in 1959; one new producing well was drilled during the year. Hinote Sand Supply Co. produced a small quantity of building sand and gravel. Fairhope Clay Products Co. mined miscellaneous clay for heavy clay products.

**Barbour.**—H. D. Loflin, Rucker Mining Co., Davis Bros., and Glenwood Mining Co., Inc., mined brown iron ore for iron and steel. R. E.

Digitized by Google

Wilson Mining Co. and D. M. Wilson Bauxite Co. mined bauxite for chemicals and refractories. Harbison-Walker Refractories Co. mined refractory kaolin for firebrick and block; production was nearly double that of 1959. The company planned to construct a plant at Eufaula to eliminate the long haul to Bessemer. McKenzie Construction Co. mined building, paving, railroad ballast, and fill sand, and building gravel.

**TABLE 16.—Value of mineral production in Alabama, by counties [1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Autauga | ---------- | $119,550 | Sand and gravel. |
| Baldwin | (2) | (2) | Petroleum, sand and gravel, miscellaneous clay. |
| Barbour | (2) | (2) | Iron ore, bauxite, kaolin, sand and gravel. |
| Bibb | $118,856 | 90,664 | Coal. |
| Blount | 2,342,146 | 1,626,264 | Coal, iron ore, cement, fire clay, sandstone. |
| Butler | 1,439,200 | 1,209,393 | Iron ore. |
| Calhoun | 482,619 | 568,509 | Sand and gravel, fire clay, iron ore, miscellaneous clay. |
| Cherokee | (2) | (2) | Limestone, iron ore, sand and gravel. |
| Chilton | (2) | 164,700 | Sand and gravel. |
| Choctaw | (2) | (2) | Petroleum. |
| Clarke | (2) | (2) | Petroleum, sand and gravel. |
| Clay | (2) | ---------- | |
| Cleburne | (2) | ---------- | |
| Colbert | (2) | (2) | Limestone, native asphalt. |
| Conecuh | (2) | (2) | Limestone. |
| Coosa | (2) | ---------- | |
| Covington | (2) | (2) | Limestone. |
| Crenshaw | (2) | 299,553 | Iron ore. |
| Cullman | 403,329 | 415,249 | Coal. |
| Dallas | 377,203 | 274,681 | Sand and gravel. |
| De Kalb | (2) | (2) | Limestone. |
| Elmore | (2) | (2) | Sand and gravel, miscellaneous clay. |
| Escambia | (2) | (2) | Petroleum, sand and gravel, miscellaneous clay. |
| Etowah | (2) | (2) | Limestone. |
| Franklin | 2,267,346 | 2,326,542 | Limestone, iron ore, sand and gravel, fire clay. |
| Greene | (2) | (2) | Sand and gravel. |
| Henry | (2) | (2) | Bauxite, limestone. |
| Houston | 34,425 | (2) | Sand and gravel. |
| Jackson | 243,204 | 113,300 | Limestone, coal. |
| Jefferson | 99,192,275 | 106,485,039 | Coal, cement, iron ore, limestone, lime, miscellaneous clay, sand and gravel, fire clay, sandstone. |
| Lawrence | (2) | ---------- | |
| Lee | (2) | ---------- | |
| Limestone | 73,853 | 67,080 | Limestone. |
| Macon | 104,990 | 188,178 | Sand and gravel. |
| Madison | (2) | (2) | Limestone, miscellaneous clay. |
| Marengo | (2) | (2) | Cement, limestone. |
| Marion | (2) | (2) | Coal, kaolin, natural gas. |
| Marshall | (2) | (2) | Limestone. |
| Mobile | (2) | (2) | Petroleum, cement, oystershell, sand and gravel, miscellaneous clay. |
| Monroe | 20,605 | 23,102 | Sand and gravel. |
| Montgomery | 720,657 | 1,410,068 | Sand and gravel, miscellaneous clay. |
| Morgan | (2) | (2) | Limestone, sand and gravel. |
| Pike | 1,128,638 | 1,724,410 | Iron ore. |
| Randolph | (2) | (2) | Mica. |
| Russell | (2) | 497,251 | Miscellaneous clay, sand and gravel |
| St. Clair | (2) | (2) | Cement, limestone, miscellaneous clay, fire clay, sand and gravel. |
| Shelby | 17,255,700 | 19,571,650 | Cement, lime, limestone, coal, miscellaneous clay, iron ore, fire clay. |
| Talladega | (2) | (2) | Marble, talc. |
| Tuscaloosa | 5,080,279 | 4,443,740 | Coal, iron ore, sand and gravel. |
| Walker | 19,953,360 | 25,482,624 | Coal, fire clay. |
| Washington | (2) | (2) | Salt, limestone, miscellaneous clay. |
| Winston | 581,816 | 575,343 | Coal. |
| Undistributed | [3] 49,026,499 | 49,939,501 | |
| Total | [3] 200,847,000 | 217,617,000 | |

[1] The following counties are not listed because no production was reported: Bullock, Chambers, Coffee, Dale, Fayette, Geneva, Hale, Lamar, Lauderdale, Lowndes, Perry, Pickens, Sumter, Tallapoosa, and Wilcox.

[3] Revised figure.

Digitized by Google

**Bibb.**—Four mines produced coal; the leading producers were W. E. Meacham Coal Co. (Belle Ellen No. 11 mine) and Blocton Coal Co. (Belle Ellen No. 9 mine).

**Blount.**—Five mines produced coal; leading producers were Alabama Coal & Ore Co., Inc. (Hopewell strip mine), and Robbins Coal Co., Inc. (Southview strip mine). Shook & Fletcher Supply Co. (Taits Gap mine) mined brown iron ore for iron and steel. Cheney Lime & Cement Co. produced masonry and slag cements at the Graystone mill. Harbison-Walker Refractories Co. (Thermal mine) and Lehigh Coal Co. (Lehigh mine) produced fire clay for firebrick and block and for other refractories. A. O. Brown quarried a small quantity of dimension sandstone for rough architectural building stone.

**Butler.**—Six companies mined brown iron ore for iron and steel; leading producers were Pigeon Creek Mining Co. and Woodward-Acree Mining Co. Total production of brown iron ore, 1929–60, was 1,194,000 tons.

**Calhoun.**—Wade Sand & Gravel Co., Inc., and John B. Lagarde, Inc., mined building sand and gravel. Donoho Foundry Co. mined fire clay for fire-clay mortar. J. E. and F. D. Brown, and Pope & Sublett mined brown iron ore for iron and steel; total production, 1906–60, was 1,355,000 tons. Agricola Brick Co. mined miscellaneous clay for heavy clay products.

**Cherokee.**—A. E. Burgess Co., Inc. and W. S. Fowler Equipment Rental Co. opened new quarries and crushed limestone for riprap and fill. Arrington Mining Co. reopened the Sidhart mine and produced brown iron ore for iron and steel. Wolf Creek Sand Co. mined a small quantity of molding sand.

**Chilton.**—Southeastern Sand-Gravel Co. mined building and paving sand and building and fluxing gravel.

**Choctaw.**—Crude petroleum production from 69 oil wells was 2 percent less than in 1959. One new producing well was drilled during the year.

**Clarke.**—Crude petroleum production from 13 oil wells declined 85 percent; one new producing well was drilled during the year. Paul Sand & Gravel Co. mined a small quantity of building sand and gravel.

**Colbert.**—Tri-State Limestone, Inc., Ralph Rogers & Co., Inc., and Alabama Asphaltic Limestone Co. (Maloney quarry) crushed limestone for roadstone, agstone, railroad ballast, and stone sand. Alabama Asphaltic Limestone (Margerum quarry) mined native asphalt for roadstone.

**Conecuh.**—Conecuh Lime Co., Inc. (Evergreen quarry), crushed limestone for agstone.

**Covington.**—Miller Lime Pit (Florala quarry) crushed limestone for roadstone and agstone.

**Crenshaw.**—McGhee & Merrill Co., Glenwood Mining Co., Inc., and Davis Bros. Mining Co. mined brown iron ore for pig iron and steel; total production, 1939–60, was 779,000 tons.

**Cullman.**—Six mines produced coal; leading producers were Marigold Coal, Inc. (No. 2 Strip mine), and H. E. Drummond Coal Co., Inc. (Drummond Strip mine).

**Dallas.**—C. Pierson Cosby and Dallas Sand & Gravel Co., Inc., mined building, paving, molding, railroad ballast, and fill sand, and building, paving, filter, railroad ballast, and fluxing gravel.

Digitized by Google

**De Kalb.**—Pearsall Limestone, Inc., crushed limestone for concrete and roads.

**Elmore.**—Alabama Gravel Co. and Birmingham Slag Co. mined building and paving sand and building and fluxing gravel. Jenkins Brick Co. mined miscellaneous clay for heavy clay products.

**Escambia.**—Crude petroleum production from 36 oil wells decreased 10 percent below 1959; no new producing wells were drilled during the year. Dixie Sand & Gravel Co. and Flomaton Gravel Co. mined building and paving sand and gravel. Keego Clay Products Co. mined miscellaneous clay for heavy clay products.

**Etowah.**—Alabama Aggregate Co. and Double R. Co. crushed limestone for concrete and roads, raprap, agstone, and fluxing stone.

**Franklin.**—Alabama Limestone Co. quarried dimension limestone for rubble, rought architectural, and sawed and cut building stone. U.S. Pipe & Foundry Co. (Russellville No. 15 mine), Shook & Fletcher Supply Co. (Blackburn mine), and Hester & Farned mined brown iron ore for pig iron and steel; total production, 1902–60, was 7,241,000 tons. Tennessee Valley Sand & Gravel Co. mined building and paving sand and gravel and produced fire clay for fire-clay mortar.

**Greene.**—Akron Sand Co. mined building and paving sand and gravel.

**Henry.**—Harbison-Walker Refractories Co. mined bauxite for refractories. Abbeville Lime Co. crushed limestone for agstone.

**Houston.**—L. C. Smith Sand & Gravel Co. and Speigner Concrete Block Co. mined building and fill sand.

**Jackson.**—The State highway department crushed limestone for concrete and roads. Widows Creek Mining Corp. (Sewannee strip mine) and Reames Coal Co. mined coal.

**Jefferson.**—Seventy-four mines produced coal; leading mines were the Concord No. 1 mine (Tennessee Coal & Iron), the Maxine mine (Alabama By-Products Corp.), and the Edgewater mine (Tennessee Coal & Iron).

Four companies produced portland cement; five companies produced masonry cement, and Southern Cement Co. produced slag cement. Leading producers of portland cement were Universal Atlas Cement Co. (Leeds mill) and Lone Star Cement Corp. (Birmingham mill). Leading producers of masonry cement were Southern Cement Co. (North Birmingham mill) and Lone Star Cement Corp. (Birmingham mill).

Tennessee Coal & Iron (Wenonah mine), Woodward Iron Co. (Pyne mine), and Republic Steel Corp. (Edwards mine) mined red iron ore for pig iron and steel. Total production of red iron ore, 1863–1960, was 298,692,000 tons.

Eight quarries crushed limestone for cement, roadstone, agstone, fluxing stone, rock dust for coal mines, lime, railroad ballast, stone sand, and refractories. Leading producers were Tennessee Coal & Iron (Dolonah quarry), Dolcito Quarry Co. (Dolcito quarry), and Universal Atlas Cement Co. (Leeds quarry).

Tennessee Coal & Iron (Ensley works) produced quicklime for chemical, industrial, and refractory use.

Seven companies mined miscellaneous clay for cement and for heavy clay products. Leading producers were Natco Corp., Universal Atlas Cement Co., and Lehigh Portland Cement Co.

Digitized by Google

Wade & Vance Sand & Gravel Co., Inc., mined building sand and gravel.

Dixie Fire Brick Co., Inc., Bibby Coal, Shale & Clay Co., and W. S. Dickey Clay Co., mined fire clay for firebrick and block, fire-clay mortar, and heavy clay products.

Universal Atlas Cement Co. and Sam P. Acton crushed sandstone for cement and refractories.

Zonolite Co. exfoliated vermiculite at its plant in Birmingham, using materials from out of State.

**Limestone.**—Limestone County Board of Revenue crushed limestone for concrete and roads.

**Macon.**—Sharpe Sand & Gravel Co. and Tri-State Sand Co. mined building, paving and molding sand, and building and paving gravel.

**Madison.**—Madison Limestone Co. (Pluski Pike & Airport quarries) and Alabama Rock Co. crushed limestone for roadstone and agstone. Alabama Brick & Tile Co. and Huntsville Brick & Tile Co., Inc., mined miscellaneous clay for heavy clay products.

**Marengo.**—Lone Star Cement Corp. produced portland cement at the Demopolis mill and crushed limestone for use in making cement.

**Marion.**—Twenty-eight mines produced coal; leading producers were Brookside-Pratt Mining Co. (New River strip mine), Webb Excavating Co. (Brilliant strip mine), and Self & Fowler Coal Co. (No. 3 mine). Thomas Alabama Kaolin Co. (Hackelburg mine) mined kaolin for floor and wall tile, firebrick and block, fillers, and insecticides. Production of natural gas declined 67 percent.

**Marshall.**—C. A. Langford crushed limestone for concrete and roads.

**Mobile.**—Production of crude petroleum from 260 oil wells expanded 43 percent; during the year, 37 new producing wells were drilled. Ideal Cement Co. produced portland cement at the Mobile mill, using oystershell dredged from Mobile Bay, and mined miscellaneous clay for use in making cement. Bay Towing & Dredging Co. and Southern Oystershell Milling Co. dredged oystershell from Mobile Bay for cement, roadstone, and poultry grit. Radcliff Gravel Co., Inc., mined building and paving sand and gravel.

**Monroe.**—Mannings Sand & Gravel Co. mined building sand and gravel.

**Montgomery.**—Five companies mined building and paving sand, and building, paving, and railroad ballast gravel; the leading producer was Birmingham Slag Co. (Conley and Cooks Station mines). Jenkins Brick Co. and Excelsior Brick Co. mined miscellaneous clay for heavy clay products.

**Morgan.**—Waters Construction Co. and Trinity Stone Co., Inc., crushed limestone for riprap, roadstone, agstone, and stone sand. Decatur Sand & Gravel Co. mined building and paving sand and gravel.

**Pike.**—Five mines produced brown iron ore for sale to iron and steel plants. Leading producers were Glenwood Mining Co., Inc. (Spring Hill mine), and Arrington Mining Co. (Brundidge mine).

**Randolph.**—Dixie Mines, Inc. (Dixie mine), mined scrap mica; part of the mica was shipped to Texas, and part was ground by the company and shipped to consumers. J. J. New (New mine) mined a small quantity of sheet mica.

**Russell.**—Bickerstaff Brick Co., Dixie Brick Co., and Bickerstaff Co., Inc., mined miscellaneous clay for heavy clay products. Con-

solidated Gravel Co., Inc., mined building, paving, and railroad ballast sand, and building and paving gravel.

**St. Clair.**—National Cement Co. produced masonry and portland cement at the Ragland mill. National Cement Co. and Birmingham Slag Co. crushed limestone for cement, agstone, and roadstone. National Cement Co. and Ragland Brick Co. mined miscellaneous clay for cement and heavy clay products. Riverside Clay Co. (Riverside and Pell City mines) mined fire clay for foundries and steelworks. Wolf Creek Sand Co. mined a small quantity of molding sand.

**Shelby.**—Southern Cement Co. produced masonry and portland cements at the Calera mill. Six limekilns produced quicklime and hydrated lime for agricultural, building, chemical, and industrial uses; leading producers were Southern Cement Co. (Roberta limekiln) and Longview Lime Corp. (Saginaw limekiln). Eight quarries crushed limestone for concrete and roads, agstone, papermills, cement, lime, riprap, fluxing stone, railroad ballast, asphalt filler, rock dust for coal mines, chemicals, and stone sand; leading producers were Birmingham Slag Co. (Calera quarry), Southern Cement Co. (Roberta quarry), and Alabama Aggregates Co. (Pelham quarry). Six mines produced coal; leading producers were River Valley Coal Co. (River Valley No. 8 mine) and Alabama Red Ash Coal Co. (No. 2 mine). Southern Cement Co. mined miscellaneous clay for cement. Shelby Sand & Ore Co. mined brown iron ore for iron and steel; total production, 1890–1960, was 1,592,000 tons. Montevallo Clay Co. mined fire clay for foundries and steelworks.

**Talladega.**—Thompson-Weinman & Co. (Hill quarry), Moretti-Harrah Marble Co., and Alabama Marble Co. crushed marble for terrazzo and other uses. Moretti-Harrah Marble Co. and Alabama Marble Co. quarried dimension marble for rough interior; cut, sawed, and dressed interior; cut and dressed exterior; and cut, dressed monumental stone. American Talc Co. (Winterboro mine) mined a small quantity of talc, and ground it for insecticides, paint, textiles, toilet preparations, and other uses.

**Tuscaloosa.**—Six mines produced coal; leading producers were Twin Seam Mining Co. (Kellerman No. 4 strip mine) and Debardeleben Coal Corp. (River Bank strip mine). Southeastern Coal & Iron Co. mined red iron ore at the Dudley mine, and Shook & Fletcher Supply Co. mined brown iron ore at the Adkins mine for pig iron and steel; total production of iron ore, 1890–1960, was 12,534,000 tons. Yazoo Gravel Co., Inc., Tuscaloosa Sand & Gravel Co., and Shackelford Construction Co. mined building and molding sand, and building gravel.

**Walker.**—Forty-three mines produced coal; leading producers were Southern Electric Generating Co. (Segco No. 1 mine), Alabama Power Co. (Gorgas mine), and Debardeleben Coal Corp. (Waterside strip mine). Russell Coal & Clay Co., Natco Corp., and Aaron Clay Co. mined fire clay for firebrick and block.

**Washington.**—Mathieson Chemical Corp. recovered salt from brine at its plant near McIntosh. Lone Star Cement Corp. crushed limestone and mined miscellaneous clay, which were shipped to Louisiana for use in making cement.

**Winston.**—McCoy Coal Co. mined coal at the Winston strip mine.

# The Mineral Industry of Alaska

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Department of Natural Resources, State of Alaska.**

By Kevin Malone,[1] Phil R. Holdsworth,[2] and Ruth Robotham[3]

DEVELOPMENTS in the oil and gas fields on Kenai Peninsula in Alaska were the outstanding features of the mineral industry of the State in 1960. Systematic drilling in the Swanson River and Soldatna Creek units by Standard Oil Co. of California resulted in 13 new oil wells and 1 gas well. Union Oil Co. of California and Ohio Oil Co. brought in an additional gas well in their Kenai unit (Kalifonsky Beach). In the first significant discovery by an independent

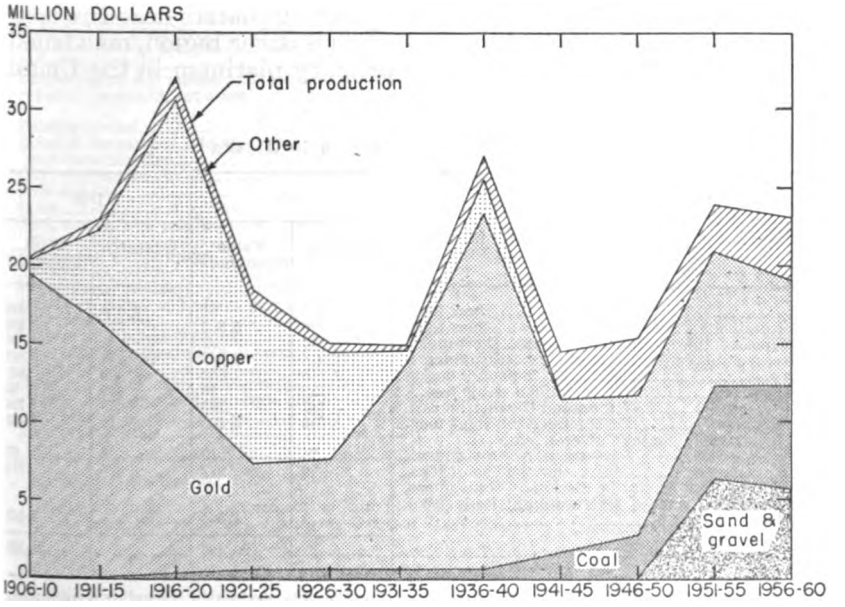

FIGURE 1.—Cumulative values of mineral production in Alaska, by major commodities, 1906–60 (five year averages).

in Alaska in almost 60 years, Halbouty Alaska Oil Co. and King Oil, Inc., brought in gas-discovery well No. 1B at West Fork, some 6 miles south of Soldatna Creek and 16 miles northeast of the Union-Ohio Kenai unit. In October, Standard of California and Richfield Oil Corp. began operating a 20-mile crude-oil line from the Swanson River field to tidewater at Nikiski.

The Anchorage Natural Gas Corp. gasline from the Kenai unit to Anchorage was partly laid; unusual difficulties in crossing Turnagain Arm forced a delay in completing this section until 1961.

Value of mineral production in Alaska increased 7 percent over 1959. The substantial gain in value of petroleum and natural gas, coupled with increases in value of output of coal, sand and gravel, stone, and mercury, more than offset a sizable decrease in gold production.

Coal replaced gold as the leading mineral commodity with 29 percent of total value. Gold, with 27 percent, and sand and gravel, with 25 percent, were next. Value of petroleum and natural gas increased from less than 2 percent of total mineral production in 1959 to almost 6 percent in 1960. These four commodities supplied 87 percent of mineral production in the State; mercury output, almost entirely from the Red Devil mine, Kuskokwim River region, supplied 4 percent. The Red Devil mine furnished 13 percent of the Nation's domestic mercury, placing Alaska third among the mercury-producing States. Goodnews Bay Mining Co., operating placers near Platinum in the southwestern part of the Kuskokwim River region, maintained its position as the only producer of primary platinum in the United States.

**TABLE 1.—Mineral production in Alaska[1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clay.....short tons | 180 | $1 | 1,150 | $10 |
| Coal, bituminous.....thousand short tons | 660 | 5,869 | 722 | 6,318 |
| Copper (recoverable content of ores, etc.).....short tons | 36 | 22 | 41 | 26 |
| Gold (recoverable content of ores, etc.).....troy ounces | 178,918 | 6,262 | 168,197 | 5,887 |
| Mercury.....76-pound flasks | 3,743 | 852 | 4,459 | 940 |
| Natural gas.....million cubic feet | 133 | 16 | 246 | 30 |
| Petroleum (crude).....thousand 42-gallon barrels | 187 | 295 | [2] 558 | [2] 1,228 |
| Sand and gravel.....thousand short tons | 5,859 | 5,265 | 6,013 | 5,483 |
| Silver (recoverable content of ores, etc.) thousand troy ounces | 21 | 19 | 26 | 23 |
| Stone.....thousand short tons | 89 | 377 | 275 | 852 |
| Value of items that cannot be disclosed: Gem stones, platinum-group metals, and uranium; lead (1960), and peat | ---------- | 1,517 | ---------- | 1,061 |
| Total Alaska | ---------- | 20,495 | ---------- | 21,858 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Preliminary figure.

Exploration expenditures for metals and nonmetals increased 63 percent over 1959. Activities in Southeastern Alaska, where iron, copper, nickel, and limestone deposits were being investigated, supplied a large part of the increase. Work on the Ruby Creek copper

| Other nonferrous ores, concentrates, metals and scrap, except precious, in crude and semifabricated forms ..... short tons | 5 | ..... | ..... | 16 | ..... | ..... |
| Fertilizer materials ..... do | 1,240 | 1,598 | ..... | 1,417 | 956 | ..... |

[1] Less than 1,000 barrels.

Source: Waterborne Commerce of the United States, Part 4, Pacific Coast, Alaska, and Pacific Islands, calendar years, 1958–59, by the U.S. Army Corps of Engineers.

deposit, Northwestern Alaska region, also was at a higher pace than in 1959.

**Employment.**—Activity at 181 mining and milling operations furnished employment for 1,715 men in 1960, compared with 253 operations and 1,733 men in 1959. Also there were 41 purely prospecting or exploration operations, employing 130 men.

Digitized by Google

**Injuries.**—No fatalities occurred in the mineral industry in 1960. Lost-time accidents increased from 79 in 1959 to 86. Time lost, not including allowance for two open cases, was 1,459 days.

**Wages and Hours.**—Mines in Alaska operated an average of 159 days. The short working period resulted from the seasonal nature of Alaska operations; in many instances severe climatic conditions restricted work to 6 or 7 months a year. Some operators worked 6 to 7 days a week and 10 hours or more a day to take advantage of favorable weather conditions.

For the mineral industries covered by the Employment Security Act (companies having at least four employees working not less than 20 weeks during the year), average monthly earnings were $747. Earnings for all mining operations except fuels were $620 per month. Coal mining monthly earnings averaged $926. In oil and gas exploration and development the figure was $806 per month.

**TABLE 4.—Number of establishments in the mineral industries in 1960, classified by number of employees**

| Type of operation | Number of establishments employing— | | | |
|---|---|---|---|---|
| | 1-9 | 10-19 | 20-29 | 30 and over[1] |
| Metal mines[2] | 167 | 7 | 2 | 5 |
| Nonmetal mines | 63 | | | |
| Quarries and mills[2] | 10 | | | |
| Coal mines | 1 | | 4 | 3 |
| Total | 241 | 7 | 6 | 8 |

[1] Includes 5 operations employing 30-39; 1 operation, 40-49; 1 operation, 60-69; 1, over 100.
[2] Includes assessment, exploration and development operations.

**TABLE 5.—Employment and injuries in the mineral industries in 1960[1]**

| Type of operation | Number of men working (average) | Average number of days worked | Man-days | Injuries (number) | |
|---|---|---|---|---|---|
| | | | | Fatal | Nonfatal |
| Metal: | | | | | |
| Lode | 108 | 117 | 12,672 | | 14 |
| Mills | 6 | 264 | 1,582 | | |
| Placer: | | | | | |
| Dredge | 390 | 216 | 84,172 | | 22 |
| Nonfloat | 176 | 128 | 22,612 | | 1 |
| Hydraulic | 12 | 115 | 1,385 | | |
| Small-scale hand | 6 | 68 | 405 | | |
| Assessment, exploration, development, and/or prospecting[2] | 262 | 97 | 25,399 | | 4 |
| Nonmetal mines[3] | 474 | 139 | 65,685 | | 1 |
| Quarries and mills | 109 | 81 | 8,799 | | |
| Coal | 302 | 177 | 53,512 | | 44 |
| Total | 1,845 | 150 | 276,223 | | 86 |

[1] Excludes officeworkers.
[2] Includes 142 men in placer assessment, exploration, development and/or prospecting; 95 in lode; and 25 in limestone exploration.
[3] Includes sand and gravel and clay operations.

**Legislation and Government Programs.**—Three new wildlife ranges, totaling more than 11 million acres, were established by administrative action of the Secretary of the Interior. This action affected 9 million acres in Northern Alaska, 1.8 million acres in the Yukon-

Digitized by Google

Kuskokwim delta, and 400,000 acres in the Alaska Peninsula. Congress had failed to act on a bill to create the new ranges. Lands within the Kuskokwim National Wildlife Range were withdrawn from all forms of appropriation under the land laws except mining location and mineral leasing (PLO 22–13); the Arctic National Wildlife Range (PLO 22–14) and the Izembek National Wildlife Range (Alaska Peninsula) (PLO 22–16), were closed to mining location but open to mineral leasing.

Lease rentals on Government oil and gas lands were set at 50 cents per acre, the minimum annual rate under the amended Mineral Leasing Act passed by Congress in 1960. Under the new regulations, lessees in Alaska may hold up to 600,000 acres but not more than 300,000 in either of two zones into which the Yukon-Tanana River system divides the State. Granting of new leases was suspended from September to mid-December pending completion of the revised regulations.

Some highlights of the Battelle Memorial Institute study of economic growth in Alaska and the Canadian Northwest over the next two decades were released toward the end of the year. Made for the Alaska International Rail and Highway Commission, the study declared that oil and tourism probably would provide the stimuli for growth, projected at a 39-percent increase in population and $1.4-billion increase in annual revenue in 20 years. Construction of a rail link from Fairbanks to Central British Columbia was considered not feasible. Such a line would need an estimated $34 million annual subsidy by 1980. Instead, $240 million highway construction program of five major road projects was advocated as a necessity for developing the northwest area. Also, provision for a ferry system for passengers, automobiles, and freight along the Inside Passage from Juneau-Haines to Prince Rupert was considered vitally important. Such a system was virtually assured when voters approved the sale of $18 million in general obligation bonds to finance construction of ferry and docking facilities.

Investigations of the scientific and technical factors involved in the proposed nuclear construction of a harbor at Cape Thompson—Project Chariot—continued during the year. A non-nuclear blast to test ground characteristics was set off at Cape Thompson in November.

Port Whittier, the U.S. Army's deep-water port serving military installations in Alaska, was deactivated in September. Power, heating, firefighting, and communication facilities were kept operational and private interests and other Government agencies took over operation of some facilities. Whittier was built during World War II at a cost of $55 million.

State legislation of interest to the mining industry included the following bills: Cancelling the State uranium bonus ($10,000); permitting geophysical, geochemical, and geological work to qualify as assessment work on mining claims; authorizing (with a $1 million appropriation) the construction and maintenance of pioneer access roads into and within areas rich in natural resources; changing the due date on assessment work from July 1 to September 1; and authorizing the Department of Natural Resources to make safety and con-

Digitized by Google

servation regulations governing mining operations. An amendment to the Fish and Game Code regulations required notification to the Commissioner, Fish and Game, of any hydraulic project on a river, lake, or stream, including crossings by wheeled or track-laying equipment or by dragging supplies or gear across or through such bodies of water. The State legislature commissioned Arthur D. Little, Inc., Cambridge, Mass., to make an economic feasibility study on the use of Alaska's major natural resources. A preliminary report was scheduled for delivery to the 1961 session of the legislature.

**Transportation.**—Approval of higher waterborne freight rates, increased 10 percent on an interim basis early in January, was still under consideration by the Federal Maritime Board at yearend. The State, working through the Governor's Office, was fighting the increased rates. Coastwise Lines abandoned its shipping service from West Coast ports to Alaska. Puget Sound-Alaska Van Lines, Inc., began weekly barge service from Seattle and bi-weekly service from San Francisco. Puget Sound had been operating as a contract carrier for Coastwise Lines. The new service employed 3 barges, each capable of carrying 300 24-foot vans.

Trans-Pacific Freight Conference, a 27-member group including 2 U.S. lines, set up rates between Japan and 8 Alaska ports. Rates averaged 30 percent higher than those to West Coast ports because of low volume, port problems, and higher insurance rates. Some allowances were made on shipments to Anchorage. Except for minor items, the Port of Anchorage facility was completed at yearend, and schedules of rates and charges were being drawn up. The $8.2 million installation was city-owned.

In May, the first shipment of steel to be imported directly from Japan arrived at Anchorage. Other Japanese shipments included cement, pipe, construction materials, chemicals, and foodstuffs. Pipe for the Anchorage Natural Gas Corp. Kenai-Anchorage line was hauled by Danish and German freighters from mills in Scotland.

Federal appropriations for road construction in the fiscal year ending June 30, 1961 were $35.9 million. National Forest Service highway funds and National Park Service road funds totaled $4 million. Funds available from all sources for roadbuilding, including State matching funds and pioneer access road funds, totaled $44.9 million. The Federal Government administered approximately one-third of the road construction projects in 1960. By the close of the 1960 construction season, the Federal Bureau of Public Roads had almost completed administration of highway construction involving Federal aid funds; Bureau of Public Roads activity in this field was expected to end in 1961, after which the agency will handle contracts for and supervise construction of roads in national parks and forests and perform its normal functions with respect to Federal aid projects.

Work on the Livengood-Eureka Highway was completed; bridges were built at Baker Creek, Hot Springs Slough, and the Hutlinana River. In the Nome area, a bridge moved from the Chena Slough (Fairbanks) was erected across the Kuzitrin River. On the Nome-Kougarok Highway (State Route 141), work on the 7.7-mile section from the Kuzitrin River to Coffee Creek was about two-thirds complete. The Coffee Creek-Neva Creek section of State Route 141 had been surveyed and the design for construction completed. At Fairbanks, the new four-lane bridge across Chena Slough was opened. The Alaska Highway was paved from Midway Lake to the Canadian border, thus completing the paving of the Alaska section of the highway.

## REVIEW BY MINERAL COMMODITIES

### METALS

**Antimony.**—No antimony ore was mined or shipped. Small stocks produced in previous years remained at a few properties.

**Beryllium.**—Prospectors and representatives of mining companies showed some interest in beryl possibilities of the Seward Peninsula. The Federal Bureau of Mines investigated beryllium prospects in Southeastern Alaska and the Seward Peninsula.

**Copper.**—Bear Creek Mining Co., a subsidiary of Kennecott Copper Corp., proceeded with exploration of the Ruby Creek copper deposit, northwest of Shungnak, Northwestern Alaska region. Five diamond drills were used to core the deposit. Admirality Alaska Gold Mining Co. continued underground exploration of the Mertie Lode copper-nickel deposit at Funter Bay, Admiralty Island. Newmont Exploration, Ltd. (Newmont Mining Co. subsidiary), explored the Nunatak deposit at Glacier Bay by diamond drilling. The deposit has showings of copper, nickel, and cobalt.

**Gold.**—Output of gold dropped sharply despite a 1 percent rise in total yards washed; value was 7 percent less than that for 1959. More than 99 percent of gold produced came from placer mines. Decreased output and value were attributed to a substantial decline in the grade of gravel washed by dredging operations and in the yardage washed by nonfloat operations. Dredges handled 4 percent more gravel, but the value of gold was 6 percent less than in 1959.

Digitized by Google

For nonfloat operations, gravel washed decreased 22 percent, and value of output declined 12 percent. Dredges supplied 82 percent of the total gold output; nonfloat operations, 16 percent; and hydraulic, small-scale hand, and lode mines, 2 percent.

Of 14.3 million yards washed by all methods, dredges accounted for 13 million yards (12.5 in 1959) or 91 percent; nonfloat operations washed 1.2 million yards (1.6 in 1959) or 9 percent. Yardage of hydraulic and small-scale hand operations was only a fraction of 1 percent. Average value per yard washed for all methods decreased from 44.3 cents in 1959 to 40.9 cents. For dredging, the decrease was from 41.2 cents to 37.4 cents. Value per yard washed for nonfloat operations increased from 67.2 cents to 75.8 cents.

**TABLE 7.—Mine production of gold, silver, and other metals,[1] in terms of recoverable metals[2]**

| Year | Mines producing | | Material sold or treated[3] (short tons) | Gold (lode and placer) | |
|---|---|---|---|---|---|
| | Lode | Placer | | Troy ounces | Value (thousands) |
| 1951-55 (average) | 5 | 139 | 9,887 | 246,356 | $8,622 |
| 1956 | 3 | 120 | 265 | 209,296 | 7,325 |
| 1957 | 4 | 87 | 11,626 | 215,467 | 7,541 |
| 1958 | 3 | 108 | 55 | 186,435 | 6,525 |
| 1959 | 2 | 94 | 617 | 178,918 | 6,262 |
| 1960 | 6 | 92 | 234 | 168,197 | 5,887 |

| Year | Silver (lode and placer) | | Other | | Total value (thousands) |
|---|---|---|---|---|---|
| | Troy | Value (thousands) | Short tons | Value (thousands) | |
| 1951-55 (average) | 33,727 | $31 | 8 | $3 | $8,656 |
| 1956 | 28,360 | 26 | 1 | (4) | 7,351 |

| 1960 | 6 | 1,375 | 48 | 3,044 | 3 | 64 | 32 | 83 |

[1] Includes copper, lead, and zinc.
[2] Less than $1,000.

Twenty-two dredges (excluding Goodnews Bay dredging operations where gold is a byproduct of platinum placers) mined gold during the year. United States Smelting, Refining and Mining Co. in the Yukon River and Seward Peninsula regions and New York-Alaska Gold Dredging Corp. in the Kuskokwim River region were the leading producers. United States Smelting, Refining and Mining Co. operated four boats in the Fairbanks district, one at Chicken (Fortymile district), and one on the Hogatza River (Hughes district), in the Yukon River region; and three in the Nome fields, Seward Peninsula region. Reduction of operations in the Fairbanks dredge fields—only four boats digging compared with six in 1959—foreshadowed the end of an industry which contributed importantly to the opening and development of Alaska. The company had sus-

TABLE 13.—Equipment used at placer mines in 1960, by regions

| Region | Number of operations | Gravel washed, thousand cubic yards[2] | Equipment used (number) | | | | |
|---|---|---|---|---|---|---|---|
| | | | Bulldozers | Draglines | Hydraulic giants | Dredges | Other[3] |
| Bristol Bay | 1 | | | | | | |
| Cook Inlet-Susitna | 5 | 9 | 3 | | 5 | | |
| Copper River | 4 | 4 | 4 | | 3 | | |
| Kuskokwim River | 5 | 1,363 | 5 | 2 | 6 | 4 | |
| Norton Sound, Alaska | 3 | 4 | 3 | | | 1 | |
| Seward Peninsula | 28 | 2,556 | 24 | 3 | 11 | 8 | 3 |
| Southeastern Alaska | 1 | | | | | | |
| Yukon River | 92 | 9,254 | 91 | 29 | 97 | 11 | 6 |
| Total | 139 | 14,361 | 135 | 34 | 122 | 24 | 9 |

[1] Includes equipment at 1 operation from which gold is a by-product of platinum-group metals recovery, and at 6 operations, which conducted prospecting, exploration or preparatory work but made no valuable mineral recovery.
[2] Partly estimated.
[3] Includes hydraulic elevators, power units, screen stackers, suction and diesel pumps.

pended thawing operations, except on a few remnants, by the close of the 1960 season; some placer ground was being leased or subleased to other operators. Estimates were that dredging at Fairbanks would be finished by 1963 or 1964. Of the three boats digging in the Nome fields, one was hung up when the season ended. Here too, thawing was confined to remnants; operations were not expected to run beyond the 1962 season.

The number of nonfloat operations (where gravel is delivered to washing plants by bulldozer or dragline) decreased to 60 from 64 in 1959 and 78 in 1958. The increase in grade of gravel washed, already noted, was not enough to offset the decrease in yardage handled; value of output decreased 12 percent. Leading nonfloat producers were Strandberg and Sons (Hot Springs and Innoko districts, Yukon River region); Far North Development Co. (Fairhaven district, Seward Peninsula region); and Flat Creek Placers (Iditarod district, Yukon River region). Both in volume of material handled and in value of gold recovered, nonfloat operations in Alaska had decreased steadily for 5 years. To counter rising costs, operators were forced to bypass marginal ground or abandon areas formerly workable. Output in 1960 was only 55 percent of the 1951–55 average.

The Fairbanks district, Yukon River, was again the major gold-producing district in Alaska; the Nome district, Seward Peninsula region, and the Iditarod district, Yukon River region followed in value of output. The Aniak district, Kuskokwim River region, ranked fourth; the New York-Alaska Gold Dredging Corp. Nyac operation contributed most of the output.

Activity in lode gold mining continued on the low scale of recent years. Two operations in the Fairbanks district, two at Hyder (Southeastern Alaska region), one at Willow Creek and one at Valdez Creek (both Cook Inlet-Susitna region) reported small production. Rehabilitation of the Mikado and other claims in the Chandalar, north of the Arctic Circle, continued; some exploration also was done at this camp.

Digitized by Google

Placer miners sold 825 ounces of natural gold (nuggets, grains, and dust, not melted or amalgamated) to buyers and jewelers, a decline of 432 ounces from 1959.

**Iron Ore.**—Interest in the iron resources of Alaska remained high. Exploration and assessment work was reported on 11 deposits; 10 of which were in the Southeastern Alaska region. One company examining a Southeastern iron-ore deposit also was exploring a limestone prospect. Humble Oil and Refining Co. continued to explore its deposit near Kemuk Mountain, Bristol Bay region.

**Mercury.**—Output of mercury increased 19 percent in quantity and 10 percent in value over the 1959 figures. The average price per flask at New York decreased from $227.48 to $210.76. Alaska Mines and Minerals, Inc., operating the Red Devil mine, Kuskokwim River region, contributed almost the entire output. Alaska ranked third among mercury-producing States. Representatives of Japanese firms made preliminary field investigations and held exploratory talks relative to Japanese operation of mercury deposits in the Kuskokwim. The Federal Bureau of Mines continued examination of the White Mountain prospect, Kuskokwim River region. Field work in the 1960 season gave promise of an important deposit.

**TABLE 14.—Mercury production**

| Year | Number of producing mines | Flasks | Value [1] |
|---|---|---|---|
| 1951-55 (average) [2] | 1 | 231 | $60,351 |
| 1956 | 2 | 3,280 | 852,538 |
| 1957 | 2 | 5,461 | 1,348,758 |
| 1958 | 2 | 3,380 | 774,223 |
| 1959 | 2 | 3,743 | 851,458 |
| 1960 | 3 | 4,459 | 939,779 |

[1] Value calculated at average New York price.
[2] No production in 1951.

**Molybdenum.**—Molybdenum showings in the Hayes Glacier area, discovered in 1959, were examined to determine the extent and grade of the deposit. Preliminary tests indicated a sizable deposit. Further work was deferred until power is available in the area. The deposit is 80 miles northwest of Anchorage, Cook Inlet-Susitna region.

**Nickel.**—Examination of nickel deposits in Southeastern Alaska continued. At Funter Bay, Admiralty Alaska Gold Mining Co. extended the 200-level toward the Mertie Lode; some diamond drilling was done. Newmont Mining Co. continued its diamond-drilling program at Brady Glacier.

**Platinum-Group Metals.**—Goodnews Bay Mining Co., again the only producer of primary platinum in the United States, mined at a slightly higher rate at its dredging operations 10 miles south of Platinum, Kuskokwim River region.

**Scrap Metals.**—Small shipments of ferrous and nonferrous scrap were shipped from the States. Most of the ferrous scrap was exported from Anchorage to Japan.

Digitized by Google

**Silver.**—Small quantities of silver were produced as a byproduct of gold ores, copper ore (Nizina district, Copper River region), and lead-silver ores (Hyder district, southeastern Alaska region).

**Tungsten.**—Activity at Alaska tungsten deposits was limited to assessment work. Weakness in tungsten prices since the close of the General Services Administration purchasing program discouraged interest in tungsten mining.

**Uranium.**—Jott Mining Co. of Oklahoma City shipped uranium ore from the Ross-Adams deposit at Bokan Mountain, Prince of Wales Island, Southeastern Alaska region. Uranium production credited to the State came from ores mined in previous years and withdrawn from stockpile in 1960 when shipped for processing.

Construction of the U.S. Army Corps of Engineers nuclear power-plant (APPR-1) at Fort Greely, Yukon River region, was almost complete at yearend. The 2,000-kilowatt plant, developed for use at isolated or remote locations, was scheduled for testing in the spring of 1961.

## MINERAL FUELS

**Coal.**—Tonnage of coal mined increased 9 percent over that of 1959; value increased 8 percent. Larger military coal contracts, 516,000 tons in fiscal 1961 compared with 456,000 in 1960, furnished the increase.

Strip mines produced 91 percent of the coal in 1960 compared with 82 percent in 1959, continued the trend away from underground coal mining. The Suntrana Mining Co. Nenana (Healy River) deposit, where 9 percent of the coal was mined, was the only underground producer credited with more than 1,000 tons. Usibelli Coal Mine, Inc., also operating in the Nenana field, bought the Suntrana properties in October, and operated the mine on a small scale at yearend.

An estimated 72 percent of the coal produced was sold for heat and power at Fort Wainwright (formerly Ladd Field) and Eielson Air Force Base near Fairbanks, at Fort Richardson and Elmendorf Air-Force Base near Anchorage, and at other military sites in Alaska. Additional quantities were sold to local utility companies for heat and power and to consumers for heating and cooking. Matanuska coal, f.o.b. mine, was priced at $13.10 per ton for steam, $13.50 for lump, and $20.00 or above for lump, home delivery; military steam coal sold at $11.00–12.00 per ton. At Fairbanks, prices were $15.40 for lump, $14.35 for chestnut No. 1, and $13.35 for chestnut No. 2, with an average $4.00 per ton delivery charge. Contract prices on large orders were appreciably lower.

One underground and six strip mines were operated compared with two and six, respectively, in 1959. Evan Jones' underground mine at Jonesville was on a maintenance basis only during 1960. Coal output continued to come from the Matanuska field, Cook Inlet-Susitna region, and the Nenana (Healy River) field, Yukon River region; only a small quantity came from the Barrow field, Northern Alaska region. Matanuska field mines (all strip) yielded 42 percent of all coal mined; Nenana mines (including Suntrana's underground operation) supplied the remaining 58 percent. Price for Matanuska coal at the tipple averaged $11.43 per ton, for Nenana coal, $6.83 per ton. All

Digitized by Google

Alaska coal averaged $8.75 per ton, compared with $8.89 in 1959. Of total tonnage mined, 47 percent was cleaned, compared with 38 percent in 1959.

**TABLE 15.—Coal production by fields**

(Thousand short tons and thousand dollars)

| Year | Field | | | | | | Total | |
|---|---|---|---|---|---|---|---|---|
| | Matanuska | | Nenana | | Barrow | | | |
| | Quantity | Value | Quantity | Value | Quantity | Value | Quantity | Value |
| 1955 | 258 | $3,055 | 381 | $2,690 | 1 | $14 | 640 | $5,759 |
| 1956 | 269 | 3,273 | 457 | 3,055 | 1 | 46 | 727 | 6,374 |
| 1957 | 237 | 2,947 | 604 | 4,337 | 1 | 12 | 842 | 7,296 |
| 1958 | 290 | 3,532 | 468 | 3,392 | 1 | 7 | 759 | 6,931 |
| 1959 | 251 | 2,977 | 409 | 2,892 | ---- | ---- | 660 | 5,869 |
| 1960 | 300 | 3,434 | 422 | 2,884 | ---- | ---- | 722 | 6,318 |

No fieldwork was conducted on the Bering River coalfield. Jewell Ridge Coal Co. of Tazewell, Va., continued laboratory testing and other studies in connection with possible shipments of Bering River coals to the Orient.

Regulations for leasing State-owned coal lands became effective April 15. Lands classified by the State as coal-bearing are leased only by competitive bid. Lands upon which a coal-bearing classification is denied by State officials are open to prospecting permits; a successful prospector may convert his permit into a noncompetitive lease.

**Petroleum and Natural Gas.**—Systematic development of the Swanson River and Soldatna Creek units (the two units together are called the Swanson River field) on the Kenai Peninsula and completion of the Swanson River-Nikiski pipeline and terminal port facilities resulted in a four-fold increase in the value of crude petroleum produced. The first tanker of crude oil from Alaska left Nikiski for the Richmond, Calif. refinery of Standard Oil Co. of California late in October. At yearend the Nikiski line was flowing at the rate of more than 6,000 barrels per day.

Of 26 wells spudded during the year (not including 1 Swanson River well that was drilled for salt water injection), 20 were completed and 6 were drilling at yearend. Five wells spudded in 1959 were completed. The 25 field completions showed 13 productive or producible oil wells (all in the Swanson River field), 3 gas wells, and 9 dry holes. The Standard-Richfield Soldatna Creek unit, with eight producers in eight tries, was outstanding. Except for the important Halbouty-King West Fork gas discovery, exploration drilling was not successful. Seven other wildcats in various parts of the State were dry holes. Exploration and development footage drilled in 1960 was 278,045 feet compared with 141,933 feet in 1959.

Petroleum exploration continued strong in 1960. In addition to Standard-Richfield's exploration and development drilling in the Swanson River field, Colorado Oil and Gas Corp. (Dangerous River unit), Benedum and Associates (Nulato unit), Richfield Oil Corp.

| 1955 | 2,519 | 1959 | 34,265 |
| 1956 | 2,515 | 1960 | 33,287 |
| 1957 | 6,516 | | |

Source: (1954–58) Bureau of Land Management; (1959–60) Geological Survey, U.S. Department of the Interior.

(Kaliakh River unit), Union Oil Co. of California (Knik Arm unit), Pan American Oil Corp. (Napatuk Creek unit), Halbouty Alaska Oil Co. (West Fork unit), and Standard-Richfield (Falls Creek unit) had crews drilling. Field parties worked the Kandik-Yukon Flats area, Copper River basin, Alaska Peninsula, Arctic Slope, Bethel basin, and the Cook Inlet-Susitna region.

Union Oil Co. and Ohio Oil Co., joint bidders, acquired 20 of the 27 tracts offered for competitive bidding by the State at the mid-July sale. Pure Oil Co., Sunray-Midcontinental Oil Co., and L. H. Hines submitted other winning bids. The tracts, on the Kenai Peninsula and in the Nushagak area, Bristol Bay region, contain 16,506 acres.

Of 26 tracts containing 78,648 acres offered at the December sale, bids were made on 9, covering 22,567 acres. El Paso Natural Gas Products Co. acquired 15,758 acres in 5 tracts at Herendeen Bay, Alaska Peninsula region. Union-Ohio, with an offshore bid on 1,552 acres at Kalifonsky Beach, Kenai Peninsula region, and Richfield Oil Corp., with an offshore bid on 5,775 acres at Katalla, Copper River region, acquired the remaining acreage.

Digitized by Google

Anchorage Natural Gas Corp. through its subsidiary, Alaska Pipeline Co., made significant progress on the overland section of the gasline from the Union-Ohio Kenai unit (Kalifonsky Beach) to Anchorage. Attempts to lay the 8.5-mile section across Turnagain Arm were thwarted by heavy winds, strong tides, and two deep channels. Heavier gear was to be brought from the Gulf of Mexico in the spring of 1961 to complete the Turnagain crossing.

At West Fork on the Kenai Peninsula, Halbouty Alaska Oil Co. and King Oil Co. brought in an important gas discovery on a tract subleased from Alaska Oil and Mineral Co., Inc. The discovery well, 16 miles northeast of the Kenai unit and 6 miles south of Soldatna Creek, tested at 80 million cubic feet per day on open flow from a depth of 5,000 feet. Union-Ohio announced that three additional wells would be drilled in the Kenai unit; one, completed late in the year, flowed 4,100,000 cubic feet per day through ⅜-inch choke from a depth of 4,300 feet. The three Kenai unit wells drilled in 1959 had capacity enough to fulfill the Union-Ohio 20-year contract to supply Anchorage Natural Gas Corp. The new wells would permit better regulation of gas flow and provide additional information on the extent of reserves. Union-Ohio continued feasibility studies on liquefaction of Kenai gas for shipment to the Orient.

In a competitive bid lease sale of 16 tracts covering 9,105 acres of Federal lands in the Gubic gasfield, Hunt Oil Co. and allied interests were high bidders on 10 tracts, totaling 5,640 acres. Colorado Oil and Gas Corp. was high bidder on the remaining six tracts of 3,465 acres. Gubic, north of the Brooks Range on the Arctic Slope, was discovered in 1951 during the U.S. Navy program of oil exploration in Northern Alaska; it is 2 miles south of Naval Petroleum Reserve No. 4 in an area recently restored to the public domain.

## NONMETALS

**Clays.**—Atlas Brick and Tile Co. erected a plant with a capacity of 50,000 to 60,000 brick per day a few miles from Anchorage. The company planned to use local common clay, blended with a better grade clay from Sheep Mountain, to make common, Norman, and commercial building brick for the Anchorage market. Basic Building Products, Inc., did not operate its Anchorage plant in 1960.

**Gem Stones.**—Raw jade for sale to lapidaries and collectors was mined on Dahl Creek, Shungnak district, Northwestern Alaska region. Shungnak Jade project continued to purchase jade produced on the Shungnak and Kobuk Rivers and Dahl Creek from Eskimo claim owners. The project, operated by Eskimos under the sponsorship of the Indian Arts and Crafts Board, supervised cutting, processing, and polishing jade into shapes for jewelry and souvenirs. Other jade miners in the Shungnak district produced jade for domestic sale and for export to Germany. Small quantities of mineral specimens, including jasper, agate, garnet, petrified wood, and metallic nuggets, were collected and sold to mineral dealers and gem collectors.

**Sand and Gravel.**—Tonnage of sand and gravel increased 3 percent, and value increased 4 percent over the 1959 figures. Military construction was less than in 1959, but increases in highway, commercial,

Digitized by Google

and industrial construction more than offset the decrease in military use.

**TABLE 18.—Sand and gravel sold or used by producers, by uses**

(Thousand short tons and thousand dollars)

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Sand: | | | | |
| Structural | 88 | $283 | 288 | $932 |
| Paving | 378 | 908 | 633 | 985 |
| Railroad ballast | (1) | (1) | 47 | 16 |
| Fill | (1) | (1) | 194 | 419 |
| Gravel: | | | | |
| Structural | 879 | 1,040 | 330 | 110 |
| Paving | 4,166 | 2,611 | 958 | 694 |
| Railroad ballast | 170 | 133 | 120 | 113 |
| Fill | (1) | (1) | 3,374 | 2,032 |
| Other sand and gravel [2] | 178 | 290 | 69 | 182 |
| Total | 5,859 | 5,265 | 6,013 | 5,483 |

[1] Included with "Other sand and gravel."
[2] Includes (1959) fill and "Other construction" sand and "Other construction" gravel; (1960) "Other construction" and "Industrial" sand, and "Other construction" and "Miscellaneous" gravel.

Average value per ton of all sand and gravel was $0.91 compared with $0.90 in 1959. Material used for State and Federal projects supplied 84 percent of total tonnage and 69 percent of total value. Of the output, 1.33 million tons (22 percent) with a value of $1.88 per ton was washed, compared with 1.26 million tons (22 percent) and $2.60 per ton in 1959. Value of unwashed sand and gravel was $0.64 per ton ($0.43 in 1959). Ten commercial operators and nine State and Federal agencies or their contractors produced sand and gravel, compared with 11 commercial and 6 Government producers in 1959. Commercial producers included the Alaska Railroad, an agency of the Department of the Interior, which is considered as a commercial producer for purposes of comparability with data published for other States.

Commercial producers accounted for 987,000 tons, or 16 percent of the output, with an average value of $1.72 per ton. Seventy-two percent of the commercial output with a unit value of $2.08, was washed; the value of unwashed material was $0.77 per ton. Twelve percent of the output by State and Federal agencies, with a value of $1.65 per ton, was washed; unwashed material was valued at $0.63 per ton.

**TABLE 19.—Stone sold or used by producers, by uses**

(Thousand short tons and thousand dollars)

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Crushed and broken: | | | | |
| Riprap | 77 | $85 | 83 | $149 |
| Concrete and roadstone | 12 | 292 | 192 | 703 |
| Total | 89 | 377 | 275 | 852 |

Digitized by Google

The Alaska Division of Highways, the U.S. Bureau of Public Roads, and the U.S. Army Corps of Engineers were the major producers. Alaska Division of Highways, reflecting the takeover of road construction and maintenance from the Bureau of Public Roads, furnished 53 percent of the tonnage credited to State and Federal agencies and 54 percent of the value.

**Stone.**—Tonnage of stone produced increased more than three times, and value was more than twice that of 1959. The increase resulted from greater use of stone in military construction and roadwork. The entire output came from quarries operated by Government agencies or their contractors. The U.S. Army Corps of Engineers was the leading producer with 70 percent of the total tonnage and 82 percent of the value. The Alaska Railroad, owned and operated by the Federal Government, was the only producer classified as commercial.

## REVIEW BY REGIONS

The Yukon River region, with placer gold from the dredge fields of Fairbanks and coal from the Nenana field as the leading mineral commodities, again led in the value of mineral production. Cook Inlet-Susitna region, with coal (Matanuska field) and sand and gravel ranked second. The Kuskokwim River region ranked third with output of mercury, platinum-group metals, and gold. There was no mineral production from the Alaska Peninsula or the Bering Sea region.

**TABLE 20.—Value of mineral production in Alaska, by regions[1]**

(Thousand dollars)

| Region | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Aleutian Islands | $564 | $76 | Sand and gravel, stone. |
| Bristol Bay | 98 | 28 | Sand and gravel, gold. |
| Cook Inlet-Susitna | 5,084 | 5,506 | Coal, sand and gravel, stone, clay, gold, silver. |
| Copper River | 184 | 165 | Sand and gravel, stone, copper, gold, silver, lead. |
| Kenai Peninsula | 745 | 1,898 | Crude petroleum, sand and gravel, natural gas. |
| Kodiak Island | 44 | 89 | Sand and gravel. |
| Kuskokwim River | 1,994 | 2,111 | Mercury, platinum-group metals, gold, silver, gem stones. |
| Northern Alaska | 16 | 21 | Natural gas. |
| Northwestern Alaska | 19 | 33 | Gem stones, gold, silver. |
| Seward Peninsula | 1,231 | 1,676 | Gold, stone, silver. |
| Southeastern Alaska | 1,928 | 932 | Sand and gravel, uranium, stone, lead, gem stones, silver, gold, copper. |
| Yukon River | 8,588 | 9,323 | Gold, coal, sand and gravel, stone, peat, silver. |
| Total | 20,495 | 21,858 | |

[1] No mineral production from Alaska Peninsula and Bering Sea regions.

**Alaska Peninsula.**—El Paso Natural Gas Products Co. was high bidder on oil lands at Herendeen Bay (Moller subdistrict) leased by the State at the December sale. The company acquired 15,758 acres at an average bid of $1.23 per acre.

**Aleutian Islands.**—Sand and gravel and stone were the only mineral commodities produced. Value was only one-third of 1 percent of the total for the State.

**Bristol Bay.**—Humble Oil and Refining Co. reported assessment work on its iron deposits near Kemuk Mountain, Nushagak subdistrict.

615629—61——7

Digitized by Google

No drilling for petroleum was reported for the region. Three companies reported 10 man-weeks spent on geophysical work for oil.

**Cook Inlet-Susitna.**—Coal and sand and gravel were the leading mineral commodities of the region, supplying almost all of the $5.5 million value of production. Small quantities of stone, clay, gold, and silver were produced.

Value of coal production, all from the Matanuska field, increased 15 percent compared with 1959; tonnage rose 20 percent. Value per ton averaged $11.43, compared with $11.84 per ton in 1959. Military contracts for Matanuska coal, which increased from 201,000 tons in 1959 to 228,000 tons in 1960, furnished the increase in the region's coal value. An estimated 76 percent of the coal mined was sold to the military. All coal in the region was strip mined. Evan Jones' underground mine at Jonesville was on a maintenance basis only for the entire year. High labor costs were given as the reason for closing the mine.

The Bureau of Mines continued to explore the Beluga River coal field. No reports were published in 1960, but an open-file report, bringing engineering and other data up to date, was being prepared for release early in 1961. Additional work on the Beluga River deposits was scheduled for 1961. Beluga River, with a large indicated reserve of coal and only 50 miles northwest of Anchorage, was a possible site for a coal-fired, mine-mouth, powerplant to serve the city's increasing power needs.

Cook Inlet-Susitna again led in production of sand and gravel in Alaska. Four commercial operations and five Government agencies or their contractors produced 2.1 million short tons valued at $2 million. The Alaska Division of Highways was the leading producer in both tonnage and value.

Construction of a cement mill in the Railbelt area moved closer to reality when Permanente Cement Co. announced plans for a $5 million plant to be built either in Anchorage or in Sutton, 50 miles northeast of Anchorage on the Glenn Highway. According to estimates, the proposed plant, with a capacity of 500,000 barrels a year would reduce cement costs in the Anchorage area 13 percent. Permanente located claims covering 240 acres of limestone deposits on the East Fork of Kings River in the Castle Mountain area (Willow Creek district). Preliminary work was to be done during 1961; plant construction, depending on results of preliminary work, was scheduled for 1962.

Tentative plans for a second cement plant, to be located in the Cantwell-Windy area 165 miles north of Anchorage on the Alaska Railroad, were also announced. Alaska Portland Cement, Ltd., purchased limestone deposits in the Windy area; plant feasibility studies were reported underway.

In petroleum activities, Union Oil Co. of California and Ohio Oil Co. drilled Knik Arm Nos. 1 and 2 in the Big Lake area 20 miles north of Anchorage. Both of the wells, drilled to depths slightly below 3,000 feet, were dry holes. Anchorage Gas and Oil Development Co. (Rosetta unit) drilled unsuccessfully north of the Knik Arm site from 1954 to 1959.

Glacier Mining Co. completed a preliminary exploration program on molybdenum showings in the Hayes Glacier area 80 miles northwest of Anchorage. Some of the major United States mining com-

Digitized by Google

panies were reported to be interested in the deposit. At the close of the 1960 field season, a spokesman for Glacier announced that work had disclosed a sizable molybdenum deposit. Because of the high development costs in the isolated area and the lack of inexpensive power, there were no immediate plans to exploit the deposit.

Gold lodes in the Willow Creek district received only a little attention. After the wide publicity given the Nation's gold problems, the small interest shown was disappointing to mining men. Lode-gold activities in the Cook Inlet-Susitna region, as elsewhere in the State, had been dormant for years.

**Copper River.**—Value of mineral production was less than 1 percent of the total for the State. Sand and gravel and stone supplied 73 percent of value of output; copper, gold, silver, and lead made up the remainder.

Richfield Oil Corp. continued wildcat operations on its Kaliakh River unit near Yakataga. Kaliakh No. 1 was deepened 9,206 feet to a total depth of 14,699 feet. The well was temporarily abandoned, pending results of subsequent drilling. Kaliakh No. 2, 2 miles north of No. 1 was drilled to 9,575 feet; it was a dry hole. Kaliakh No. 2 RD, a directional redrill at 4,975 feet in No. 2, was drilling at 10,532 feet at yearend. Richfield's wells are 50 miles from those drilled by Phillips Petroleum Corp. and 75 miles east of the old Katalla field, which produced 154,000 barrels of oil from shallow depths from 1903 to 1933. At the December sale of State oil lands leases, Richfield was high bidder on 5,257 acres offshore at Katalla. The company bid $1.09 per acre.

No fieldwork was reported on the coal deposits in the Bering River field. Jewell Ridge Coal Co. (Tazewell, Va.) continued laboratory and other studies in connection with future exploitation of Bering River coal.

**Kenai Peninsula.**—Development of the Peninsula's Swanson River field into a major oil producer during 1960 was the outstanding event in the mineral industry of the region as well as of the entire State. The Swanson River field is made up of the Swanson River and Soldatna Creek units. From 17 producing or producible wells at the end of the year, Swanson River was pumping more than 6,000 barrels per day through the newly constructed Nikiski pipeline. Plans to increase the capacity of the line from 10,000 to 30,000 barrels per day were reported underway.

During the year, of seven wells (not including one drilled for salt water injection) spudded in the Swanson River unit, four were brought in as producing oil wells and one as a gas well; one was a dry hole, and one was drilling at yearend. Of two wells spudded in 1959 and completed in 1960, one was a producing oil well and one, a dry hole. In the Soldatna Creek unit, nine wells were spudded in 1960 and one well was drilling as the year began. Of the 10 wells, 8 were completed as producing oil wells and 2 were drilling at yearend. Thus, the two units of Swanson River field showed 16 wells spudded in 1960 and 3 wells drilling as the year began; 3 of the 19 were drilling at the close of the year. Of the 16 completions, 13 were producing or producible oil wells and 1 was a gas well. Two of the wells, both in the Swanson River unit, were dry holes. Development drilling in

Digitized by Google

the two units (not including one salt water injection well) totaled 185,441 feet for the year. The Soldatna Creek unit was developed almost entirely in 1960; of 99,597 feet drilled in the unit, all but 251 feet was drilled in 1960.

Since Richfield's 1957 discovery well at Swanson River, 26 wells (including discovery well No. 34–10 but excluding 1 well drilled for salt water injection) have been spudded. Of 23 completions at the end of 1960, 17 were producing or producible oil wells; 1 was a gas well; 4 were dry holes, and 1 well was shut in when flow dropped after 8 months of production. Soldatna Creek had eight producing oil wells in eight completions. Unit productivity of Soldatna Creek wells ranged from 700 to 800 barrels per day of 38° (API) oil.

In exploratory drilling elsewhere on the Peninsula, Halbouty-Alaska Oil Co. and King Oil Co. spudded and completed two wells. On the Bishop Creek unit (north of the Kenai unit and west of Soldatna Creek unit) No. 11 was drilled to 9,034 feet, plugged, and abandoned as a dry hole. At West Fork, the company brought in a significant gas discovery, Halbouty-King No. 1B. Drilled to 14,019 feet, the well showed no oil; gas flow (free) was measured at 80 million cubic feet per day from a depth of 5,000 feet. West Fork is 6 miles south of the Soldatna Creek unit and 16 miles northeast of the Union-Ohio Kenai unit (Kalifonsky Beach). Alaska Oil and Mineral Co., leaseholder, had an interest, along with Halbouty-King, in West Fork. At yearend, no plans to exploit the new discovery had been announced.

Union-Ohio completed one of three additional wells announced for the Kenai unit; a second well was drilling at yearend. Kenai unit 14–4, completed late in November, tested at 4.1 million cubic feet per day on a ¾-inch choke from 4,300 feet.

Early in December, Standard-Richfield spudded Falls Creek No. 1, 2 miles south of Clam Gulch and 20 miles south of the Union-Ohio Kenai unit. Falls Creek No. 1 was a directional well to tap offshore formations under Cook Inlet. Depth at yearend was 6,474 feet.

The proposed $15.8 million Bradley Lake hydropower project (Kachemak Bay) received initial approval of the U.S. Army Corps of Engineers. A 60,000-kilowatt tidewater plant at Battle River, 25 miles northeast of Homer, was proposed to relieve an anticipated power shortage in the Anchorage area.

**Kodiak.**—A small quantity of sand and gravel by the U.S. Navy was the only mineral output reported for the region.

Two tidelands tracts on Kodiak, near Ugak, were offered at the State's competitive oil lease sale in December. There were no bidders.

**Kuskokwim River.**—The region ranked third in value of mineral output. Mercury, platinum-group metals, and gold contributed almost the entire output; a small quantity of silver was produced as a by-product of gold and platinum dredging operations.

Operations at the Red Devil mine, Aniak district, Georgetown subdistrict, were the second highest in the history of the mine. The 1960 output was exceeded only by that of 1957. Red Devil, supplying almost all of Alaska's mercury, produced an estimated 13 percent of the U.S. output. Alaska Mines and Minerals, Inc., operator of Red Devil, continued its program of surface and underground explora-

Digitized by Google

tion in the search for new ore bodies. The company used an 8-inch, tractor-mounted auger equipped with tungsten-carbide cutting tips in surface prospecting. Borings were made through as much as 40 feet of overburden to obtain bedrock samples. Underground exploration, employing both crosscutting and longholing, successfully located the faulted segment of the Dolly series above the 450 level. The Dolly discovery substantially increased ore reserves at Red Devil. At the close of the year, Red Devil was sinking the main shaft (incline) from the 450 to the 600 level.

The Goodnews Bay Mining Co. platinum dredging operations 10 miles south of Platinum contributed substantially to the value of mineral output in the region. Value per yard was somewhat higher than in 1959, and the quantity produced also increased over 1959.

The New York-Alaska Gold Dredging Corp. gold dredging operations at Nyac in the southeastern part of the region contributed appreciably to the value of the mineral output of the Kuskokwim; Nyac was the third-ranking gold producer in the State, after the Fairbanks and Nome operations of the United States Smelting, Refining and Mining Co. The company had a 6½-foot dredge digging 8,000 cubic yards per day and a 1½-foot dredge digging 1,500 yards per day. The latter was used for prospecting and to determine the over-run factor—the factor by which dredge recovery exceeds the values found in drilling the ground. The over-run factor was appreciable at Nyac. A third dredge of 4 cubic feet was to be rebuilt to 6-feet boat for use in the 1961 season, bringing estimated capacity to 3 million cubic yards per year. Nyac operated 7 months in 1960.

Pan American Petroleum Corp. completed core-drilling tests in the Napatuk Creek area, Bethel district. The company was building a road to the site of the first exploratory well as the year closed.

Shell Oil Co. received a 5-year development contract on 450,000 acres 90 miles southwest of Bethel on Kuskokwim Bay. Shell held 105,928 acres in the area. The contract called for at least three exploratory wells in the 5-year period and a minimum expenditure of $950,000. Shell must also relinquish one-half the acreage before January 1, 1964.

**Northern Alaska.**—Value of mineral output was small, only a fraction of 1 percent of the total for the State. A small quantity of coal (less than 1,000 tons) was produced at Meade River for consumption at Barrow. Gas wells on Naval Petroleum Reserve No. 4 supplied 172 million cubic feet of natural gas, valued at $20,699, to Government agencies and to the Puget Sound and Drake powerplant at Barrow.

At the Federal Bureau of Land Management February sale, Hunt Oil Co. and Colorado Oil and Gas Corp. were successful bidders on the 16 tracts offered on the Gubic structure. The tracts are near the Colville River, northeast of Umiat and east of and adjacent to Naval Petroleum Reserve No. 4.

Field crews of 6 companies reported 92 crew-weeks on geological and geophysical work along the Arctic Slope in the 1960 season.

**Northwestern Alaska.**—Gem stones and gold and silver were the only mineral commodities produced. Value was only a fraction of 1 percent of the total value of mineral output in the State.

Digitized by Google

Digitized by Google

prospecting for iron in 1960. Columbia Iron Mining Co. continued work on a deposit at Union Bay, Cleveland Peninsula, and on the Klukwan deposit, Juneau district, Skagway subdistrict. Mt. Andrew Mining Co., a subsidiary of Utah Construction and Mining Co., diamond-drilled at Vixen Inlet, Cleveland Peninsula, and at Mt. Andrew, Kasaan Peninsula. The Poorman Group, also on Kasaan Peninsula, was explored by Prince of Wales Mining Co. W. S. Pekovich did work on deposits at Port Snettisham and Point Astley, both in the Juneau district.

Columbia Iron Mining Co. drilled or examined limestone deposits on Heceta and Wadleigh Islands. A Dahl Island limestone deposit was drilled by Ideal Cement Co.

Exploration on the Brady Glacier copper-nickel deposit north of Dundas Bay, Juneau district, continued. Fremont Mining Co. and Newmont Mining Co. had interests in the area. Moneta Porcupine Mines, Ltd., had a 10-man field party prospecting for copper near Endicott Arm and in other parts of the region. Admiralty-Alaska Gold Mining Co. did work on the Mertie Lode at Funter Bay. Mineral Basin Mining Co. drifted and diamond drilled on its gold-copper property in the Hyder district.

Colorado Oil and Gas Corp. spudded and drilled to 8,634 feet, Dangerous River No. 1, 15 miles southeast of Yakutat; the well was a dry hole. Colorado announced that British Petroleum Exploration Co. (Alaska), Inc., and Sinclair Oil and Gas Corp. had taken an interest in the 1-million-acre development contract at Yakutat. Other interests with Colorado were Frankfort Oil Co. and Continental Oil Co.

**Yukon River.**—Mines of the Yukon River region supplied 43 percent of the value of mineral production in Alaska. Gold, coal, sand and gravel, and stone were the leading mineral commodities. Value of gold produced declined 13 percent; value of coal was unchanged; the combined value of sand and gravel and stone, attributable largely to military construction, increased 113 percent. Total value of mineral production for the region increased 8 percent, about the same rate as that for the State.

Ten dredges, two less than in 1959, were active. United States Smelting, Refining and Mining Co. continued as the leading gold producer. It operated four dredges in the Fairbanks district (down from six in 1959); one on the Hogatza River, Hughes district; and one at Chicken, Fortymile district. Others mining by dredge were Alluvial Golds, Inc., on Woodchopper Creek, and JAK Mining Co., on Crooked Creek, both in the Circle district; Minalaska, Inc., on Ganes Creek, Ophir district; and Miscovich Brothers, on Otter Creek, Iditarod district. Miscovich Brothers took over the Otter Dredging Co. operation on Flat Creek part way through the dredge season. Dredging furnished 80 percent of the gold output of the region.

Nonfloat plants contributed 18 percent of the value of gold production in the region. Strandberg and Sons (Eureka Creek, Hot Springs district and Colorado Creek, Innoko district), Flat Creek Placers (Flat Creek, Iditarod district), Wolf Creek Mining Co. (Fish Creek and Wolf Creek, Fairbanks district), Prince Creek Mining Co.

Digitized by Google

(Prince Creek, Iditarod district), and Ruby Mining Co. (Long Creek, Ruby district) were among the leading nonfloat producers.

Lode-gold mining attracted only a little attention. Little Squaw Mining Co. continued its program of reopening and exploring some of the Chandalar lodes. Arctic Alaska Fisheries and Enterprises, Inc., worked its vein on the old Homestake property in the Fairbanks district. Ore was treated at the Cleary Hill mill. The Lookout mine at Ester Dome reported a small production.

Three strip mines and one underground mine produced coal during the year. Usibelli Coal Mine, Inc., Cripple Creek Coal Co., and Arctic Coal Co. operated strip mines in the Nenana (Healy River) field. The Suntrana Mining Co. underground mine produced coal in the early months of the year. The mine was sold to Usibelli in October, and Usibelli was working the mine on a reduced scale at yearend. A small quantity of coal was produced at Meade River for consumption at Barrow. Alaska Resources, Inc., mined a small quantity of peat from the Fox Pit, 10 miles north of Fairbanks, for use as a soil conditioner. Pit-run material sold at $3 per yard and shredded peat sold at $4.50 per yard, both f.o.b. pit.

Benedum and Associate's Nulato unit wildcat in the Anvik district was a dry hole. The well was drilled to 12,015 feet, plugged, and abandoned. Twelve companies reported 75 crew-weeks in geological or geophysical work on oil.

Chatanika Power Co. announced plans for constructing an ice dam for power development on the Chatanika River at Shovel Creek, 22 miles below Olnes. Construction by buildup spraying in winter was being studied; moss and decomposed vegetation locally available would be used to insulate in warm weather. The company's Chatanika Syphon powerplant continued in operation throughout the 1960 season.

Preliminary studies of the Rampart Dam project by the U.S. Army Corps of Engineers were underway. Planned to harness the entire flow of the Yukon, the project would create a lake 10,850 square miles in area (larger than Lake Erie) and 200 miles long. Estimates were that it would take 20 years after completion of the dam to fill the lake. Potential capacity, at 4.8 million kilowatts, would make Rampart the largest hydroelectric installation in the Western Hemisphere—2½ times the capacity of Grand Coulee. At yearend preparations were being made to move drilling equipment to the damsite.

The U.S. Army Corps of Engineers nuclear powerplant (APPR-1) at Fort Greely was still under construction at yearend.

# The Mineral Industry of Arizona

This chapter has been prepared under a cooperative agreement for the collection of mineral data, except minerals fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Arizona Bureau of Mines.

By William H. Kerns,[1] F. J. Kelly,[1] and D. H. Mullen[1]

ARIZONA'S COPPER INDUSTRY in 1960 again dominated the mineral industries of the State. One-half of the Nation's copper came from Arizona, and the metal represented $345.8 million, or 83 percent of the State's $415.8 million total value of all minerals produced. An $81.6 million increase in the value of copper was primarily responsible for the $88.9 million, or 27-percent advance in the State's total output. Resumption of copper production in January 1960 from several of the principal producing mines, which had been closed by a strike during the last 5 months of 1959, a full-year's output from these and one new major mine, and increased output from a number of the important mines accounted for the significant increase in copper production in 1960.

Output of metals (mainly copper, but including byproduct gold, silver, and molybdenum from copper-ore treatment; lead; zinc; uranium ore; and byproduct vanadium from uranium-ore treatment) furnished $379.7 million or 91.3 percent of the total value of mineral production. Nonmetals (primarily sand and gravel, cement, stone, lime, and pumice) supplied $35.8 million or 8.6 percent of the total, and fuels (coal and petroleum) accounted for the remaining $0.3 million or 0.1 percent.

**Employment and Injuries.**—Preliminary data compiled by the Bureau of Mines for employment and injuries in the mineral industries in Arizona in 1960, excluding the petroleum industry, are shown in table 2. Copper mines alone accounted for two-thirds of the total man-hours worked and fatal and nonfatal injuries. However, the frequency rate (injuries per million man-hours) for copper mines was lower than that of the total.

**Legislation and Government Programs.**—No Office of Mineral Exploration (OME) contracts were executed in Arizona in 1960. Following an announcement late in 1959 by the Office of Civil and Defense Mobilization (OCDM), the General Services Administration (GSA) called for bids to supply nonferrous soft asbestos of domestic origin for the national stockpile. The initial bids opened on April 29 were rejected, but new bids opened on June 7 were acceptable for No. 2

[1] Commodity-industry analyst, Bureau of Mines, Denver, Colo.

Digitized by Google

fiber from three apparent low bidders. Initial shipments to GSA by two operators were rejected, and no purchases had been made by the close of the year. Arizona's manganese industry was at a near standstill throughout the year as a result of completion of the Government carlot purchase program in 1959.

**TABLE 1.—Mineral production in Arizona[1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays[2] thousand short tons | 120 | $179 | 173 | $260 |
| Coal do | 7 | 63 | 6 | 58 |
| Copper (recoverable content of ores, etc.) short tons | 430,297 | 264,202 | 538,605 | 345,784 |
| Gem stones | (3) | 88 | (3) | 120 |
| Gold (recoverable content of ores, etc.) troy ounces | 124,627 | 4,362 | 143,064 | 5,007 |
| Lead (recoverable content of ores, etc.) short tons | 9,999 | 2,300 | 8,495 | 1,988 |
| Lime thousand short tons | 123 | 1,666 | 148 | 2,430 |
| Manganese ore and concentrate (35 percent or more Mn) short tons, gross weight | 68,183 | 5,727 | 1,626 | 40 |
| Manganiferous ore and concentrate (5 to 35 percent Mn) short tons, gross weight | 10,693 | 234 | 8,677 | 190 |
| Mica (scrap) short tons | 3,060 | 55 | (4) | (4) |
| Molybdenum (content of concentrate) thousand pounds | 3,181 | 4,019 | 4,359 | 5,211 |
| Petroleum (crude) thousand 42-gallon barrels | 25 | (4) | [5] 73 | (4) |
| Pumice thousand short tons | 487 | 1,153 | 703 | 1,164 |
| Sand and gravel do | 13,458 | 11,966 | 14,490 | 14,235 |
| Silver (recoverable content of ores, etc.) thousand troy ounces | 3,896 | 3,528 | 4,775 | 4,322 |
| Stone thousand short tons | 2,468 | 3,998 | 4,249 | 5,107 |
| Uranium ore short tons | 253,340 | 6,319 | 283,684 | 6,219 |
| Zinc (recoverable content of ores, etc.) do | 37,825 | 8,565 | 35,811 | 9,239 |
| Value of items that cannot be disclosed: Asbestos, beryllium concentrate 1960, cement, clays (bentonite), feldspar, gypsum, mercury, perlite, pyrites, tungsten concentrate, vanadium, and values indicated by footnote 4 | | [6] 9,511 | | 16,115 |
| Total Arizona[7] | | [6] 336,562 | | 415,776 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Excludes bentonite; included with "Value of items that cannot be disclosed."

# REVIEW BY MINERAL COMMODITIES

## METALS

**Beryllium.**—A small quantity of 10 percent BeO ore was recovered from the Homestead lode, Yavapai County, by Earl Anderson. The hand-cobbed ore was shipped to the Beryl Ores Co., Arvada, Colo.

**Copper.**—Arizona again ranked first in the United States in output of copper and accounted for 50 percent of the Nation's production. Arizona copper output increased 25 percent in quantity (108,308 short tons) and 31 percent ($81.6 million) in value from 1959. Copper supplied 91 percent of the value of metals and 83 percent of the State value of all minerals produced.

**TABLE 3.—Fifteen leading copper-producing mines in 1960, in order of output**

| Rank in 1960 | Rank in 1959 | Mine | District | County | Operator | Source of copper in 1960 |
|---|---|---|---|---|---|---|
| 1 | 1 | Morenci | Copper Mountain. | Greenlee | Phelps Dodge Corp. | Gold-silver ore, copper ore, copper precipitates. |
| 2 | 3 | San Manuel | Old Hat | Pinal | San Manuel Copper Corp. | Copper ore. |
| 3 | 2 | New Cornelia | Ajo | Pima | Phelps Dodge Corp. | Gold-silver tailings, gold-silver ore, copper ore. |
| 4 | 5 | Lavender pit Copper Queen. | Warren | Cochise | do | Copper ore, copper precipitates. |
| 5 | 6 | Ray pit | Mineral Creek | Pinal | Kennecott Copper Corp. | Do. |
| 6 | 4 | Inspiration | Globe-Miami | Gila | Inspiration Consolidated Copper Co. | Do. |
| 7 | 9 | Esperanza | Pima | Pima | Duval Sulphur & Potash Co. | Copper ore. |
| 8 | 8 | Silver Bell Unit. | Silver Bell | do | American Smelting and Refining Co. | Copper ore, copper precipitates. |
| 9 | 11 | Magma | Pioneer | Pinal | Magma Copper Co. | Gold-silver ore, copper ore. |
| 10 | 7 | Copper Cities | Globe-Miami | Gila | Tennessee Corp.[1] Copper Cities Division. | Copper ore. |

Source: Company published annual reports except where otherwise specified.

Production of copper advanced from 28,000 short tons produced in January to 37,000 tons in February, and then rose to 48,000 tons in March. Slight increases and decreases were recorded above and below the March output, but the remaining 9 months averaged 47,000 tons a month. The significant increase in the first quarter resulted primarily from the resumption of output from several of the principal producing mines, which had been forced to stop operations during the last 5 months of 1959 because of a labor strike. Operations that resumed activity in the first quarter of 1960 after the strike ended included the Copper Queen and Morenci Branches of the Phelps Dodge Corp., Ray Division of Kennecott Copper Corp., and Magma and San Manuel properties of Magma Copper Co. Other major as well as smaller copper mining and milling operations and custom shippers that were not idled by the labor strike had been forced to stockpile ore or concentrate at the mines or mills or to curtail production during the strike because the smelters to which they had shipped were closed.

The 5 leading copper producers furnished 368,500 short tons, or 68 percent of the copper output, and the top 15 accounted for 530,500 tons or 98 percent. Of the five leading mines, three were operated

Digitized by Google

by Phelps Dodge Corp.; one by San Manuel Copper Corp., a subsidiary of Magma Copper Co.; and one by a division of the Kennecott Copper Corp.

The Duval Sulphur & Potash Co. Esperanza open-pit copper mine and 12,000-ton-per-day mill, which began operating in March 1959, had its first full year of operation in 1960. Maximum production was maintained. At the close of the year mine development was well advanced with six mining levels available for producing ore and three additional levels advancing in waste overburden to develop additional ore. A drilling program to evaluate a porphyry copper deposit in northwestern Arizona, begun in 1959 by Duval, was still in progress at yearend.

The $43.5 million program of American Smelting and Refining Co. (Asarco) to bring its Mission Project open-pit copper mine into scheduled production by 1962 was well advanced by the close of the year. Construction work begun in March on its $17 million 15,000-ton-per-day concentration plant and scheduled for completion in September 1961, progressed on schedule. Stripping of the 200 feet of overburden continued throughout the year; 31.3 million tons, well over half of the total preoperation stripping required, was removed by the end of the year. Principal service buildings, including the

**TABLE 5.—Mine production of gold, silver, copper, lead, and zinc in terms of recoverable metals [1]**

| Year | Mines producing | | Material sold or treated [2] (thousand short tons) | Gold (lode and placer) | | Silver (lode and placer) | |

[1] Operations at miscellaneous cleanups not counted as a producing mine.
[2] Does not include gravel washed or tonnage of precipitates shipped.
[3] Production of Graham County combined with Santa Cruz County to avoid disclosing individual company confidential data.
[4] Byproduct of uranium ore.
[5] Less than 1 ton.

machine shop, warehouse, and changehouse, and a 7-mile railroad spur, were completed. Development operations at Mission were described.[2]

In April, Inspiration Consolidated Copper Co. purchased and began operating the International Smelting and Refining Co. Miami copper smelter adjacent to International's concentrating plant. Concentrate and cement copper from the operation at Inspiration and material from other producers were treated at the smelter. In addition, the Inspiration refinery was expanded and placed in operation in February. The purchase of the smelter and expansion of the refinery were undertaken to anticipate the increased output expected when the Christmas mine of the company begins producing in late 1961 or early 1962 and to reduce smelting and refining costs. The purchase gave the company an integrated mining, milling, smelting, and re-

[1] Detail will not necessarily add to totals because some mines produce more than 1 class of material.
[2] From properties not classed as mines.

fining operation, and placed it in a position to ship the full copper output of its Inspiration and Christmas mines in the form of refined copper cathodes.

The McDonald 18-foot circular shaft at the Christmas mine, 12 miles north of Winkelman, had been sunk to 1,576 feet, 204 feet short of final depth, by the close of the year. In addition, 1,431 feet of development drifts, raises, and station excavation were driven in 1960. A circular concreted air shaft, 12 feet in diameter, with a planned depth of 1,205 feet, was completed to a depth of 462 feet. Final determination of the mill flowsheet and layout was made, equipment ordered, and construction begun. Construction of the miscellaneous service building and facilities was continued. The operation was designed for a production and milling capacity of 4,000 tons of ore per day; copper output was expected to approximate 36 million pounds per year. Christmas mine development was described.[3]

Following 3 years of deep diamond drilling and geological and geophysical surveying by its exploration subsidiary (Bear Creek

**TABLE 8.—Mine production of gold, silver, copper, lead, and zinc in 1960, by types of material processed and methods of recovery, in terms of recoverable metals**

| Type of material processed and method of recovery | Gold (troy ounces) | Silver (troy ounces) | Copper (pounds) | Lead (pounds) | Zinc (pounds) |
|---|---|---|---|---|---|
| Lode: | | | | | |
| Amalgamation: Ore | 4 | 1 | | | |
| Cyanidation: Ore | 4,211 | 35,145 | | | |
| Total recoverable in bullion | 4,215 | 35,146 | | | |
| Concentration and smelting of concentrates: | | | | | |
| Ore [1] | 110,446 | 4,216,819 | [2] 963,239,600 | 16,706,900 | 71,589,000 |
| Old tailings | | 123 | | 13,500 | 400 |
| Total | 110,446 | 4,216,942 | 963,239,600 | 16,720,400 | 71,589,400 |
| Direct-smelting: | | | | | |
| Ore | 27,248 | 501,902 | 43,748,400 | 248,700 | 17,900 |
| Copper precipitates | | | 66,691,000 | | |
| Smelter cleanings, etc | 1,028 | 20,993 | 3,391,800 | 20,900 | 14,700 |
| Total | 28,276 | 522,895 | 113,831,200 | 269,600 | 32,600 |
| Other: Leaching of copper ore | | | [3] 139,200 | | |
| Placer | 127 | 9 | | | |
| Grand total | 143,064 | 4,774,992 | 1,077,210,000 | 16,990,000 | 71,622,000 |

[1] Includes uranium-ore concentrate.
[2] Includes copper recovered from leaching of ore at one operation that employs dual-process treatment of leaching followed by flotation concentration; combined to avoid disclosing individual company confidential data.
[3] All other copper recovered by leaching was from one operation and is included with "Lode: Concentration and smelting of concentrates: Ore" as indicated in footnote reference 2

Mining Co.) on a copper mineralized area northeast of Safford, Kennecott Copper Corp. purchased 120 mining claims in the area in 1959 and applied for patent on 53 of the claims in 1960. In addition, at the close of the year a contract was awarded to Boyles Bros. Drilling Co. for a 795-foot vertical two-compartment shaft on the property with inside dimensions of 9 feet 2 inches by 5 feet 6 inches. Another contract was to be let for drifting, crosscutting, and raising from the 3,900-foot level to be cut at a distance of 754 feet from the collar.

Phelps Dodge Corp. started exercising options to buy approximately 300 mining claims 10 miles north of Safford and 2 miles west of the property purchased by Kennecott in December. In a drilling program conducted by the company on the claims in 1959, copper mineralization reportedly was found in one hole at a depth of 1,000 feet. No immediate plans for further exploration and development of the claims, on which the options to buy were exercised, were announced. American Metal Climax, Inc., terminated its option on claims on Turtle Mountain north of the Phelps Dodge property at yearend in 1959.

By midyear 1960, three major mining companies and others had located extensive holdings of mining claims in the Twin Buttes mining area 6½ miles south of Banner Mining Co., Pima Mining Co., and American Smelting and Refining Co. (Mission Project) operations south of Tucson. Reportedly, American Metal Climax, Inc., located approximately 300 claims in the 10-square-mile area and drilled four test holes ranging in depth from 1,250 to 1,500 feet. Bear Creek Mining Co. staked claims and started drilling test holes. Asarco filed on 162 claims north of those located by American Metal Climax, Inc.

(Prince Creek, Iditarod district), and Ruby Mining Co. (Long Creek, Ruby district) were among the leading nonfloat producers.

Lode-gold mining attracted only a little attention. Little Squaw Mining Co. continued its program of reopening and exploring some of the Chandalar lodes. Arctic Alaska Fisheries and Enterprises, Inc., worked its vein on the old Homestake property in the Fairbanks district. Ore was treated at the Cleary Hill mill. The Lookout mine at Ester Dome reported a small production.

Three strip mines and one underground mine produced coal during the year. Usibelli Coal Mine, Inc., Cripple Creek Coal Co., and Arctic Coal Co. operated strip mines in the Nenana (Healy River) field. The Suntrana Mining Co. underground mine produced coal in the early months of the year. The mine was sold to Usibelli in October, and Usibelli was working the mine on a reduced scale at yearend. A small quantity of coal was produced at Meade River for consumption at Barrow. Alaska Resources, Inc., mined a small quantity of peat from the Fox Pit, 10 miles north of Fairbanks, for use as a soil conditioner. Pit-run material sold at $3 per yard and shredded peat sold at $4.50 per yard, both f.o.b. pit.

Benedum and Associate's Nulato unit wildcat in the Anvik district was a dry hole. The well was drilled to 12,015 feet, plugged, and abandoned. Twelve companies reported 75 crew-weeks in geological or geophysical work on oil.

Chatanika Power Co. announced plans for constructing an ice dam for power development on the Chatanika River at Shovel Creek, 22 miles below Olnes. Construction by buildup spraying in winter was being studied; moss and decomposed vegetation locally available would be used to insulate in warm weather. The company's Chatanika Syphon powerplant continued in operation throughout the 1960 season.

Preliminary studies of the Rampart Dam project by the U.S. Army Corps of Engineers were underway. Planned to harness the entire flow of the Yukon, the project would create a lake 10,850 square miles in area (larger than Lake Erie) and 200 miles long. Estimates were that it would take 20 years after completion of the dam to fill the lake. Potential capacity, at 4.8 million kilowatts, would make Rampart the largest hydroelectric installation in the Western Hemisphere—2½ times the capacity of Grand Coulee. At yearend preparations were being made to move drilling equipment to the damsite.

The U.S. Army Corps of Engineers nuclear powerplant (APPR–1) at Fort Greely was still under construction at yearend.

# The Mineral Industry of Arizona

This chapter has been prepared under a cooperative agreement for the collection of mineral data, except minerals fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Arizona Bureau of Mines.

By William H. Kerns,[1] F. J. Kelly,[1] and D. H. Mullen[1]

ARIZONA'S COPPER INDUSTRY in 1960 again dominated the mineral industries of the State. One-half of the Nation's copper came from Arizona, and the metal represented $345.8 million, or 83 percent of the State's $415.8 million total value of all minerals produced. An $81.6 million increase in the value of copper was primarily responsible for the $88.9 million, or 27-percent advance in the State's total output. Resumption of copper production in January 1960 from several of the principal producing mines, which had been closed by a strike during the last 5 months of 1959, a full-year's output from these and one new major mine, and increased output from a number of the important mines accounted for the significant increase in copper production in 1960.

Output of metals (mainly copper, but including byproduct gold, silver, and molybdenum from copper-ore treatment; lead; zinc; uranium ore; and byproduct vanadium from uranium-ore treatment) furnished $379.7 million or 91.3 percent of the total value of mineral production. Nonmetals (primarily sand and gravel, cement, stone, lime, and pumice) supplied $35.8 million or 8.6 percent of the total, and fuels (coal and petroleum) accounted for the remaining $0.3 million or 0.1 percent.

**Employment and Injuries.**—Preliminary data compiled by the Bureau of Mines for employment and injuries in the mineral industries in Arizona in 1960, excluding the petroleum industry, are shown in table 2. Copper mines alone accounted for two-thirds of the total man-hours worked and fatal and nonfatal injuries. However, the frequency rate (injuries per million man-hours) for copper mines was lower than that of the total.

**Legislation and Government Programs.**—No Office of Mineral Exploration (OME) contracts were executed in Arizona in 1960. Following an announcement late in 1959 by the Office of Civil and Defense Mobilization (OCDM), the General Services Administration (GSA) called for bids to supply nonferrous soft asbestos of domestic origin for the national stockpile. The initial bids opened on April 29 were rejected, but new bids opened on June 7 were acceptable for No. 2

# REVIEW BY MINERAL COMMODITIES

## METALS

**Beryllium.**—A small quantity of 10 percent BeO ore was recovered from the Homestead lode, Yavapai County, by Earl Anderson. The hand-cobbed ore was shipped to the Beryl Ores Co., Arvada, Colo.

**Copper.**—Arizona again ranked first in the United States in output of copper and accounted for 50 percent of the Nation's production. Arizona copper output increased 25 percent in quantity (108,308 short tons) and 31 percent ($81.6 million) in value from 1959. Copper supplied 91 percent of the value of metals and 83 percent of the State value of all minerals produced.

**TABLE 3.—Fifteen leading copper-producing mines in 1960, in order of output**

| Rank in 1960 | Rank in 1959 | Mine | District | County | Operator | Source of copper in 1960 |
|---|---|---|---|---|---|---|
| 1 | 1 | Morenci | Copper Mountain. | Greenlee | Phelps Dodge Corp. | Gold-silver ore, copper ore, copper precipitates. |
| 2 | 3 | San Manuel | Old Hat | Pinal | San Manuel Copper Corp. | Copper ore. |
| 3 | 2 | New Cornelia | Ajo | Pima | Phelps Dodge Corp. | Gold-silver tailings, gold-silver ore, copper ore. |
| 4 | 5 | Lavender pit Copper Queen. | Warren | Cochise | do | Copper ore, copper precipitates. |
| 5 | 6 | Ray pit | Mineral Creek | Pinal | Kennecott Copper Corp. | Do. |

Source: Company published annual reports except where otherwise specified.

Production of copper advanced from 28,000 short tons produced in January to 37,000 tons in February, and then rose to 48,000 tons in March. Slight increases and decreases were recorded above and below the March output, but the remaining 9 months averaged 47,000 tons a month. The significant increase in the first quarter resulted primarily from the resumption of output from several of the principal producing mines, which had been forced to stop operations during the last 5 months of 1959 because of a labor strike. Operations that resumed activity in the first quarter of 1960 after the strike ended included the Copper Queen and Morenci Branches of the Phelps Dodge Corp., Ray Division of Kennecott Copper Corp., and Magma and San Manuel properties of Magma Copper Co. Other major as well as smaller copper mining and milling operations and custom shippers that were not idled by the labor strike had been forced to stockpile ore or concentrate at the mines or mills or to curtail production during the strike because the smelters to which they had shipped were closed.

The 5 leading copper producers furnished 368,500 short tons, or 68 percent of the copper output, and the top 15 accounted for 530,500 tons or 98 percent. Of the five leading mines, three were operated

Digitized by Google

by Phelps Dodge Corp.; one by San Manuel Copper Corp., a subsidiary of Magma Copper Co.; and one by a division of the Kennecott Copper Corp.

The Duval Sulphur & Potash Co. Esperanza open-pit copper mine and 12,000-ton-per-day mill, which began operating in March 1959, had its first full year of operation in 1960. Maximum production was maintained. At the close of the year mine development was well advanced with six mining levels available for producing ore and three additional levels advancing in waste overburden to develop additional ore. A drilling program to evaluate a porphyry copper deposit in northwestern Arizona, begun in 1959 by Duval, was still in progress at yearend.

The $43.5 million program of American Smelting and Refining Co. (Asarco) to bring its Mission Project open-pit copper mine into scheduled production by 1962 was well advanced by the close of the year. Construction work begun in March on its $17 million 15,000-ton-per-day concentration plant and scheduled for completion in September 1961, progressed on schedule. Stripping of the 200 feet of overburden continued throughout the year; 31.3 million tons, well over half of the total preoperation stripping required, was removed by the end of the year. Principal service buildings, including the

[4] Byproduct of uranium ore.
[5] Less than 1 ton.

machine shop, warehouse, and changehouse, and a 7-mile railroad spur, were completed. Development operations at Mission were described.[2]

In April, Inspiration Consolidated Copper Co. purchased and began operating the International Smelting and Refining Co. Miami copper smelter adjacent to International's concentrating plant. Concentrate and cement copper from the operation at Inspiration and material from other producers were treated at the smelter. In addition, the Inspiration refinery was expanded and placed in operation in February. The purchase of the smelter and expansion of the refinery were undertaken to anticipate the increased output expected when the Christmas mine of the company begins producing in late 1961 or early 1962 and to reduce smelting and refining costs. The purchase gave the company an integrated mining, milling, smelting, and re-

[1] Includes uranium-ore concentrate.
[2] Includes copper recovered from leaching of ore at one operation that employs dual-process treatment of leaching followed by flotation concentration; combined to avoid disclosing individual company confidential data.
[3] All other copper recovered by leaching was from one operation and is included with "Lode: Concentration and smelting of concentrates: Ore" as indicated in footnote reference 2

Mining Co.) on a copper mineralized area northeast of Safford, Kennecott Copper Corp. purchased 120 mining claims in the area in 1959 and applied for patent on 53 of the claims in 1960. In addition, at the close of the year a contract was awarded to Boyles Bros. Drilling Co. for a 795-foot vertical two-compartment shaft on the property with inside dimensions of 9 feet 2 inches by 5 feet 6 inches. Another contract was to be let for drifting, crosscutting, and raising from the 3,900-foot level to be cut at a distance of 754 feet from the collar.

Phelps Dodge Corp. started exercising options to buy approximately 300 mining claims 10 miles north of Safford and 2 miles west of the property purchased by Kennecott in December. In a drilling program conducted by the company on the claims in 1959, copper mineralization reportedly was found in one hole at a depth of 1,000 feet. No immediate plans for further exploration and development of the claims, on which the options to buy were exercised, were announced. American Metal Climax, Inc., terminated its option on claims on Turtle Mountain north of the Phelps Dodge property at yearend in 1959.

By midyear 1960, three major mining companies and others had located extensive holdings of mining claims in the Twin Buttes mining area 6½ miles south of Banner Mining Co., Pima Mining Co., and American Smelting and Refining Co. (Mission Project) operations south of Tucson. Reportedly, American Metal Climax, Inc., located approximately 300 claims in the 10-square-mile area and drilled four test holes ranging in depth from 1,250 to 1,500 feet. Bear Creek Mining Co. staked claims and started drilling test holes. Asarco filed on 162 claims north of those located by American Metal Climax, Inc.

Transarizona Resources, Inc., completed a plant and development of an open-pit mine south of Casa Grande and began copper production in July. This plant was the first commercial application in the United States of the salt-coke-segregation process to recover copper from copper-silicate ore. It had a rated capacity of 250 tons of ore per day with provisions for enlargement. Salt (30 to 50 tons per week) for the chloridizing furnace was trucked from Carlsbad, N. Mex. Mining and milling operations were described.[4]

Banner Mining Co. five-compartment Palo Verde shaft was completed by Centennial Development Co. at a depth of 960 feet, short of the 1,020-foot intended mark, because an excessive quantity of water was encountered. Banner then took over development of the mine and began cutting stations and ore and waste pockets on the 700, 800, and 900 levels. By yearend 100 tons of ore per day was being produced from development work and treated in the company mill. Development work on an around-the-clock basis was continuing to bring the mine into full production of 1,000 tons per day in late 1961. Banner Mining Co. and Pima Mining Co. reached an agreement under which Pima would mine 1.8 million tons of Banner's Daisy mine ores from Pima's open pit over a 7-year period starting in 1962. Preparatory stripping to enlarge Pima's open pit, by Pima, was ahead of schedule. The ore was to be milled by Pima. Underground mining in the Daisy workings was halted by Banner. Revisions were completed at the Pima mill by Pima Mining Co., resulting in an increase in daily mill capacity from 3,000 to 3,800 tons per day.

The 500-foot Copper Queen shaft of Cyprus Mines Corp., located near its producing Old Dick mine, was completed by Centennial Development Co.; stations were cut at the 300- and 450-foot levels to intersect the vein; and a small tonnage of development copper-zinc ore was produced and treated in the Old Dick mill.

Ground-breaking ceremonies in July officially marked the start of construction of the Bagdad Copper Corp. $2 million leaching plant and auxiliary sulfuric acid plant at its Bagdad open-pit copper operation. The plant, scheduled for completion in June 1961, was designed to recover 20 tons of copper per day from low-grade oxide ore stockpiled during stripping and mining operations to produce ore for the company concentration plant.

As part of a $40 million expansion program by Kennecott Copper Corp. at its Ray operation a new water reclamation plant was completed and placed in operation in June. The new plant will recover additional water from the mill tailings using a radioactive isotope gamma ray source coupled with a detection unit to control automatically the density of the solids in the thickener. This is believed to be the first application of such a device in the copper industry. The limitations of the company water rights from the Gila River had controlled the quantity of ore that could be treated. Therefore, the availability of the additional water reclaimed was an important factor that enabled the company to increase the capacity of the Ray Mines Division from 15,000 to 22,500 tons of ore per day.

Digitized by Google

The operating mines and plants of Miami Copper Co. in Arizona were acquired by the Tennessee Corp. on June 10, except for a royalty interest in the copper reserves which were to be sold by Miami to institutional investors for a reported $15 million. The Miami Copper Co. was to be liquidated. The transaction involved leaching operations at the Miami and Castle Dome properties and open-pit mining and milling at the Copper Cities property.

A $5 million expansion program started in 1959 by the Phelps Dodge Corp. on the Lavender open-pit mine of its Copper Queen Branch to extend the life of the mine by 7 years or more to about 14 years continued in 1960. Buildings were relocated to permit enlargement of the open pit to the southeast. Stripping in this area was started, a new diesel powerplant was completed, and four 35-ton capacity dump trucks were purchased.

Gold.—Gold output increased 15 percent and directly reflected the advance in production of copper as 81 percent of the gold was recovered from copper ore. Of the remainder, 17 percent came from lead-zinc ore, and 2 percent was recovered from miscellaneous material and other classes of ore.

Three mining operations—Copper Queen Branch and New Cornelia Branch (Phelps Dodge Corp.) and Iron King Branch (Shattuck Denn Mining Corp.), in descending order of output—furnished 69 percent of the State's gold output. San Manuel (San Manuel Copper Corp.), Magma (Magma Copper Co.), and Morenci (Morenci Branch of Phelps Dodge Corp.) supplied 28 percent.

Iron.—Ray Mines Division, Kennecott Copper Corp., continued to produce sinter (sponge iron) from pyrite recovered by the company as a byproduct of the treatment of copper ore at Hayden and from pyrite purchased from Magma Copper Co. The sinter and sulfuric acid, both produced from pyrite, were used in the leach-precipitation-flotation (L-P-F) process in the Ray concentrator.

Phelps Dodge Corp. started constructing a small plant at the company smelter at Douglas for the manufacture of sponge iron from iron oxides produced in smelting operations. The sponge iron produced will be used in the precipitation of copper from solution in the company leaching operation at Bisbee in place of detinned cans presently obtained principally from outside the State.

Southwest Iron and Steel Co. combined with the Arkota Steel Co. and broke ground near Coolidge for the construction of a plant to produce pig iron. Raw material for the plant was to come from Southwest's magnetite-bearing alluvial deposit 40 miles north of Tucson. The plant, being built by Arkota with a planned initial capacity of 75 tons of pig iron daily, will employ a sponge-iron-electric furnace process reported developed by Julius D. Madaras. The magnetite was to be mined by open-pit methods and concentrated by the magnetic separation process, then trucked to the plant.

The Colorado Fuel and Iron Corp. submitted the successful—and only—bid for an exclusive prospecting permit for iron and other minerals, including uranium, on 120,200 acres, 188 square miles, in the northwestern section of the Fort Apache Indian Reservation in Arizona. The permit was for 2 years with the right to extend it for an additional 2 years if desired. The company had made geologic

Digitized by Google

studies in the area during the past 2 years and announced that substantial reserves of iron ore had been indicated by this work.

Webb & Knapp, Inc., signed a contract in October with U.S. Bonneville Power Administration to provide power for a steel plant at Anaconda, Mont. However, a company spokesman stated this action did not mean abandonment of plans for a similar steel plant at Clarkdale. The company had announced plans in June for tripling the capacity of the projected steel mill at Clarkdale from 100,000 tons per year to 350,000 tons and for raising the cost of the mill from $15 million to $40 million. The steel would be produced from copper slag, owned by the company, remaining from the Clarkdale copper smelter (last operated in 1950).

**Lead.**—Lead production (8,495 short tons) dropped 15 percent compared with 1959 (9,999 short tons), and was far below the 5-year average for 1949–53 of 20,659 short tons. Two producers, Shattuck Denn Mining Corp. (Iron King mine) and Nash & McFarland (Flux mine) accounted for the bulk of the output.

Operations at the Iron King mine at Humboldt continued throughout the year without interruption. Test-drilling on the main ore structure to depths below the presently developed levels was conducted and, according to the company, confirmed the continuation of the mineralized structure. Metallurgical research was continued toward the development of new products, such as soil conditioners and plant-food supplements, which could be made from the sulfur and iron contained in the mill tailings. Ore from the Flux mine was treated in the Nash & McFarland Trench mill. In addition, some custom ore was treated in the Trench mill.

**Manganese Ore and Concentrate.**—When the quota was reached on the Government manganese ore and concentrate carlot-purchase program on August 5, 1959, the manganese industry in Arizona came to a near standstill, and this condition continued throughout 1960. Two operators produced manganese concentrate by treating manganese mill tailings and marketed their products commercially. Shipments of manganiferous ore and concentrate to the plant of Kaiser Steel Corp., Fontana, Calif., by Mohave Mining and Milling Co. of Wickenburg, ended in June, and Mohave liquidated all company assets by the close of the year.

**Mercury.**—Mercury production increased fivefold compared with 1959. All output came from three mines in the Mazatzal Mountains in Gila and Maricopa Counties, the State's principal mercury-producing area. The Turn Bull mine in Maricopa County operated by Bacon, Grimes & Brunson, partners, was the largest producer followed by the Lola Lee mine operated by Jack Ralston and the Oneida mine operated by the Oneida Mining Co.

**Molybdenum.**—Molybdenum was produced as a byproduct of copper mining and milling at six of the State's leading copper mines in 1960, compared with seven in 1959. Miami Copper Co. had discontinued its Miami operation in 1959, but despite the drop of one producer, output of molybdenum increased 37 percent in quantity and 30 percent in value in 1960. This substantial gain was the direct result of increased copper production. Part of the increased output was recorded by Duval Sulphur & Potash Co. at its Esperanza operation. Duval

Digitized by Google

began producing in 1959 and had its first full-year's output in 1960. The five other mines with molybdenum byproduct production were Inspiration, Morenci, Silver Bell, San Manuel, and Bagdad.

**Silver.**—A 22-percent increase ($794,000) in silver production directly reflected the advance in copper output, because 77 percent of the silver was recovered as a byproduct of copper ore. Most of the remainder came from lead-zinc ores, but some came from copper-zinc, lead, and gold-silver ores and miscellaneous materials treated.

**Uranium.**—Production of uranium ore from 64 operations in five counties was 12 percent greater than in 1959. The mine value of the ore, however, decreased 1 percent because of a decline in grade from 0.30 percent (6.0 pounds) $U_3O_8$ per ton in 1959 to 0.26 percent (5.2 pounds) in 1960. Major production continued to be from Apache, Coconino, and Navajo Counties. Virtually all of the ore mined in Coconino and Gila Counties was processed at the Rare Metals Corporation of America mill at Tuba City which operated the entire year. Ores from Apache and Navajo Counties were processed at mills in Colorado, New Mexico, and Utah.

**TABLE 9.—Mine production of uranium ore, by counties[1]**

| County | 1959 | | | | 1960 | | | |
|---|---|---|---|---|---|---|---|---|
| | Number of operations | Ore (short tons) | $U_3O_8$ contained (pounds) | F.o.b. mine value[2] | Number of operations | Ore (short tons) | $U_3O_8$ contained (pounds) | F.o.b. mine value[2] |
| Apache | 16 | 85,384 | 445,808 | $1,846,018 | 19 | 108,835 | 544,279 | $2,272,187 |
| Cochise | 1 | 22 | 80 | 285 | 1 | 15 | 42 | 118 |
| Coconino | 37 | 53,956 | 406,261 | 1,755,640 | 30 | 90,931 | 522,602 | 2,211,835 |
| Gila | | | | | 4 | 2,103 | 14,966 | 65,448 |
| Navajo | 11 | [3] 114,028 | [3] 661,260 | [3] 2,707,429 | 10 | 81,800 | 405,528 | 1,669,840 |
| Yavapai | 1 | (3) | (3) | (3) | | | | |
| Total | 66 | 253,390 | 1,513,409 | 6,309,372 | 64 | 283,684 | 1,487,417 | 6,219,428 |

[1] Based on data supplied to the Bureau of Mines by AEC.
[2] F.o.b. mine value; base price, grade premiums, and exploration allowance.
[3] Production of Yavapai County combined with that of Navajo County to avoid disclosing individual company confidential data.

**Vanadium.**—Uranium ores in Apache County, and to a lesser extent in Navajo County, contained vanadium in sufficient quantity to warrant its recovery. Vanadium was recovered from those ores that were processed at mills equipped with vanadium-recovery units in southwestern Colorado (Climax Uranium Co. at Grand Junction and Vanadium Corporation of America [VCA] at Durango) and northwestern New Mexico (Kerr-McGee Oil Industries, Inc., at Shiprock). The quantity of vanadium recovered from ores of Arizona origin was more than double that of 1959.

**Zinc.**—A 4-percent decrease in quantity and 8-percent increase in value of zinc production were recorded in 1960. The increased value of output despite a drop in production reflected the rise in the weighted annual average price for zinc from 11.5 cents per pound in 1959 to 12.9 cents in 1960. The Iron King mine, operated by Shattuck Denn Mining Corp., was again by far the principal zinc producer in the State, followed by the Old Dick mine (Cyprus Mines Corp.),

Digitized by Google

Atlas mine (B. S. & K. Mining Co.), Johnson Camp mine, Moore shaft (McFarland & Hullinger), and the Flux mine (Nash & McFarland). These five producers accounted for 99 percent of the State's zinc output.

## NONMETALS

**Asbestos.**—Shipments of asbestos from mines near Globe, Gila County, continued to decline, dropping 9 percent below 1959. However, as a result of a higher average price for fiber sold, the total value for 1960 output was 11 percent above 1959. Except for a small quantity of grades 1, 2, and 3, shipments during the year were restricted to shorts and filter fiber. Producers in order of output were: Jaquays Mining Corp. (Regal and Chrysotile mines), Metate Asbestos Corp. (Metate), Kyle Asbestos Mines of Arizona (Sloan Creek), and LeTourneau Asbestos Corp. (Asbestos Peak).

A new mill was constructed about 2 miles east of Globe by LeTourneau Asbestos Corp. The mill processed ore from the Asbestos Peak and Bore Tree Saddle properties. GSA, pursuant to an announcement late in 1959 by OCDM, called for bids to supply nonferrous, soft asbestos of domestic origin for the national stockpile. The initial bids opened on April 29 were rejected, but new bids opened on June 7 indicated the following acceptable low bidders for No. 2 fiber: Jaquays Mining Corp., 450 tons at $918 per ton; Metate Asbestos Corp., 40 tons at $920; and Kyle Asbestos Mines of Arizona, 10 tons at $925. An initial shipment of 130 tons of No. 2 crude submitted to the Government on July 20 by two operators was rejected. No purchases were made by GSA during the year. A description of the Arizona asbestos industry was published.[3]

**Barite.**—A report was published discussing all known barite occurrences in Arizona as well as history, ownership, and production for most of the deposits.[4]

**Cement.**—On June 17 ceremonies were held at the Glen Canyon damsite observing the pouring of the first load of concrete. The cement for this concrete came from the Clarkdale plant of Phoenix Cement Co. Division, American Cement Corp.

Cement requirements for the construction of the dam and a gain in consumption of cement in industrial and residential construction boosted Arizona's cement sales 61 percent above the 1959 figure. All of the portland and masonry cements produced was consumed in Arizona, except for a small quantity exported.

Plans to expand operations at the two cement plants in the State were of major importance to the industrial growth of Arizona. A building permit was issued to Arizona Portland Cement Co. to construct five new storage silos, a new finishing mill, and loading facilities for bulk and sack cements at its plant on the Southern Pacific main track to supply the new loading docks at the company Rillito plant. The plant had a daily capacity of 8,000 barrels with three kilns operating on a three-shift basis. In the latter part of 1960,

[4] Stewart, S. A., and Wilson, E. D., Barite Deposits of Arizona: Bureau of Mines Repr. of Investigations [illegible], 56 pp.

Digitized by Google

Phoenix Cement Co. announced plans to increase the capacity of its Clarkdale plant by 800,000 barrels annually by constructing an additional kiln. The new kiln will bring the plant capacity to 2.6 million barrels. Details and information about the new plant at Clarkdale were published.[7]

**Clays.**—Despite a 58-percent drop in the production of bentonite in Apache County, the overall output of all types of clay increased 18 percent over 1959. Gains in the production of miscellaneous clay and shale in Maricopa and Pinal Counties were responsible for the increase. The addition of the Phoenix Brick Yard to the list of active quarry operations accounted for the bulk of the increased production of miscellaneous clay and shale. Gila Pottery Co., operator of the Weary Lode in Gila County, went out of business during 1960.

**Feldspar.**—International Minerals & Chemical Corp. (IMC) continued to be the only producer of crude and ground feldspar. Sena Mining Co. was the mine operator, and all crude output was shipped to the Kingman mill of IMC for grinding. The bulk of the ground feldspar was shipped to consumers in California, although some shipments were reported to Ohio, Texas, Washington, Utah, and Mexico.

**Gem Stones.**—Interest in the collection of gem or ornamental stones by individuals, societies, and dealers resulted in the collection of an estimated $120,000 worth of material in 1960. This compared with a value of $88,000 in 1959. The collection of turquois and copper specimens in Gila County and petrified wood and various mineral specimens in Yavapai County accounted for 45 percent of the total value of all gem stones collected in 1960.

**Gypsum.**—The gypsum industry of Arizona continued to consist of three mining operations in Pinal County, and output was 16 percent above 1959. Arizona Gypsum Corp. mined gypsum near Winkelman and sold its uncalcined output for use as a portland-cement retarder and for agricultural purposes. Garcia & Peters Gypsum Co. sold crude gypsum from its Mammoth property for agricultural uses. Union Gypsum Co., with a wallboard and lathe plant at Phoenix, was acquired by National Gypsum Co. of Buffalo, N.Y., during 1960. The mining operation supplying crude gypsum was centered at the old Harless mines near Feldman. The crude ore was trucked to Winkelman for rail shipments to the Phoenix wallboard plant.

**Lime.**—Production (sold or used) of lime in Arizona rose 20 percent above comparable 1959 data. The same five lime-burning operations reporting in 1959 were active in 1960. Although the bulk of the lime sold or used in 1960 was consumed within the State, some shipments were made to California, Mexico, and New Mexico. The use of lime in the concentration of metallic ores (principally copper) accounted for 88 percent of all the lime sold or used. Other smaller uses included alkalies, sand-lime and slag brick, coke and gas, glass, open-hearth furnaces, and water purification. Kennecott Copper Corp. constructed a lime plant at its Ray copper concentrator at Hayden. The plant had five vertical kilns and was to supply lime for use as a conditioning

Digitized by Google

agent in copper flotation. No production was reported in 1960 for the new plant.

**Mica.**—An increase in the demand for ground mica by roofing paper and paint manufacturers resulted in a substantial gain in the mine production of scrap mica. The Buckeye Mica Co., with a mill at Buckeye and mines near Quartzite and Buckeye, accounted for nearly all of the production. James Stewart Co. produced a small quantity of ground mica from a gougelike material recovered from the Charleston mine near Tombstone. During 1960 the Tombstone Mica Co., Inc., leased the Charleston mine and laid out a development program.

**Nitrogen Compounds.**—Randall Mills Corp., operator of Bat Cave 600 feet above the Colorado River in Grand Canyon, did not produce or sell any guano during 1960.

**Perlite.**—Although Tucson Perlite, Inc., did not mine any perlite in 1960, output for the State was 5 percent above that of 1959. Increased production from the Superior operation of Harborlite Corp. was responsible for the gain. Arizona Perlite Roofs, Inc., new name for Perlite Industries of Arizona, Inc., Pinal County mining operation, produced less perlite in 1960 than in 1959. Expanding plants were operated at Phoenix by Perlite Industries of Arizona and at Tucson by Tucson Perlite, Inc. The latter plant used crude perlite mined in 1959. Building plaster, loose-fill insulation, concrete aggregate, and block manufacturing consumed all of the expanded perlite produced in 1960. Harborlite Corp. shipped its crude output to a company-owned plant in California.

**Pumice.**—Production and sales of pumice (scoria) continued to climb, reaching 703,000 tons, 44 percent above 1959. All six mining operations in the State recorded gains in output. The Atchison, Topeka and Santa Fe Railway Co. operated its Darling pit near Winona and was the largest producer; all the output was used for railroad ballast. The need for scoria in the manufacture of building block and for fill consumed all of the mine production of Superlite Builders Supply Co. and Paul Zanzucchi (supplying crude material to Harenberg Block Co., Inc., of Flagstaff). San Xavier Rock & Sand Co. continued to quarry scoria from its Douglas pit as did Gila Cinder Co. from its Graham County operation. Yavapai Block Co. near Ashfork began mining in 1960, at the Cruice cinder pit.

**Pyrites.**—Production of pyrites was slightly more than double the 1959 total. Kennecott Copper Corp., at Hayden, accounted for the bulk of the output. Magma Copper Co. shipped a small quantity to Kennecott; all the pyrite was consumed at the sulfuric acid plant of Kennecott at Hayden. Crude sulfur from Texas was used in the manufacture of sulfuric acid at plants near Benson, Chandler, and Inspiration. A contact sulfuric acid plant was under construction by Bagdad Copper Corp. at Bagdad. Crude sulfur will be used as the raw material.

**Sand and Gravel.**—An 8-percent increase in the production and use of sand and gravel raised the State total to 14.5 million tons valued at $14.2 million. Commercial output accounted for 44 percent, and Government-and-contractor production accounted for 56 percent of the total production. Maricopa County was the center of production

Digitized by Google

activity, with an output of nearly 6 million tons. A report [8] showed that from July 1956 to January 1961 Arizona completed, to full or acceptable interstate standards, 201.9 miles of road plus 312.4 miles of highway adequate for present traffic, for a total of 514.3 miles open to traffic. On the basis of completed mileage, Arizona ranked sixth in the Nation. However, in terms of work in progress on the interstate system, Arizona ranked 33d, with 167.5 miles in construction, engineering, or right-of-way status.

**TABLE 10.—Sand and gravel production in 1960, by counties**

(Thousand short tons and thousand dollars)

| County | Quantity | Value | County | Quantity | Value |
|---|---|---|---|---|---|
| Apache | 459 | $331 | Pima | 975 | $1,237 |

**Stone.**—Production of all types of stone rose to 4.2 million tons valued at $5.1 million, compared with 2.5 million tons and $4 million in 1959. Sixty-seven percent of the tonnage increase was accounted for by the Federal Bureaus of Indian Affairs and Public Roads which quarried basalt, limestone, and miscellaneous stone. A gain in the output of limestone used in the manufacture of cement and lime was largely responsible for an increase in commercial stone production.

**Vermiculite.**—Crude vermiculite from Montana was exfoliated at the Glendale plant of Ari-Zonolite Co. Output of finished product was 45 percent greater and was used as insulation, and in plaster and concrete aggregate, agriculture, and acoustical products.

**TABLE 12.—Stone production in 1960, by counties**

| County | Short tons | Value | County | Short tons | Value |
|---|---|---|---|---|---|
| Apache | 641,620 | $646,024 | Navajo | 34,157 | $25,618 |

## MINERAL FUELS

**Coal.**—Coal production, from the Cow Spring No. 3 mine in Coconino County and the Keams Canyon No. 4 mine in Navajo County, was 14 percent below that of 1959.

**Petroleum and Natural Gas.**—Petroleum production which came from three fields in Apache County, was 73,000 barrels, nearly three times that of 1959. During the year 39 wells were completed—20 exploratory and 19 development. Of the 20 exploratory wells, 1 was listed as a discovery. The discovery well was in the southern portion of the Paradox Basin 2.5 miles northwest of the Bita Peak field. Initial production was 8 barrels of oil a day, on pump, from the McCracken (Devonian) formation at a depth of 6,758 to 6,794 feet. Two successful development wells were completed in the Dry Mesa field. Additional drilling was done in the Pinta Dome area, primarily for the development of shallow helium gas reserves. Drilling activity was uneventful; however, an increased interest in the possibility of substantial production was evidenced by a rise in leasing, which reached 2 million acres during the year.

## REVIEW BY COUNTIES

**Apache.**—Output of uranium ore and byproduct vanadium from uranium-ore milling accounted for three-quarters of the $5.2 million value of mineral production in the county. Apache County led the State in the production of these two commodities. Uranium ore,

Digitized by Google

nearly all of which was processed at mills in Colorado and New Mexico, was produced at 19 operations. Principal producers were Kerr-McGee Oil Industries, Inc., at the Mesa group mines and VCA at the Monument No. 2 mine. Most of the uranium ores mined contained a significant quantity of vanadium which was recovered from those ores processed at mills equipped with vanadium-recovery units, in Colorado and New Mexico. The quantity of vanadium recovered was substantially greater than in 1959.

Petroleum production from three fields nearly tripled that of 1959. Of the 39 wells drilled in the State, 34 were in Apache County. Drilling totaled 81,763 feet. Three of the wells completed (one exploratory and two development) were successful.

The production of nonswelling bentonite by Alba Mining Co. in the Sanders area continued to decline. A shift in highway construction resulted in a substantial drop in output of sand and gravel, but because of road construction by the Federal Bureaus of Indian Affairs, Forest Service, and Public Roads, output of stone rose from 35,700 tons in 1959 to 641,600 in 1960.

**TABLE 15.—Value of mineral production in Arizona, by counties**

| County | 1959 | 1960 | Minerals produced in 1960, in order of value |
|---|---|---|---|
| Apache | [1] $4,253,943 | [2] $5,212,471 | Uranium ore, vanadium, stone, sand and gravel, petroleum, clays, gem stones. |
| Cochise | 31,963,199 | 44,255,697 | Copper, gold, lime, stone, sand and gravel, zinc, silver, pumice, lead, gem stones, mica (scrap), uranium ore. |
| Coconino | 4,884,107 | 7,622,708 | Sand and gravel, uranium ore, stone, pumice, coal, gem stones. |
| Gila | 50,239,827 | 47,186,532 | Copper, molybdenum, asbestos, sand and gravel, silver, lime, uranium ore, stone, gold, gem stones, lead, mercury, zinc. |
| Graham | 153,582 | 150,596 | Sand and gravel, pumice, lead, gem stones, copper, zinc, silver, gold. |
| Greenlee | 48,064,455 | 70,413,650 | Copper, molybdenum, lime, silver, gold stone, gem stones. |
| Maricopa | 6,698,542 | 6,384,838 | Sand and gravel, mica (scrap), clays, manganese ore and concentrate, manganiferous ore and concentrate, mercury, gem stones, silver, copper, stone, gold. |
| Mohave | 982,759 | 346,651 | Sand and gravel, stone, feldspar, silver, manganiferous ore and concentrate, lead, copper, zinc, gem stones, gold. |
| Navajo | 3,170,572 | 2,220,445 | Uranium ore, sand and gravel, copper, coal, stone, vanadium, gem stones, silver, zinc, gold, lead. |
| Pima | [1] 91,325,129 | 98,271,821 | Copper, cement, molybdenum, sand and gravel, gold, silver, zinc, stone, clays, gem stones, manganiferous ore and concentrate, lead. |
| Pinal | 61,236,788 | 106,722,094 | Copper, molybdenum, gold, sand and gravel, silver, gypsum, lime, pyrites, stone, perlite, manganiferous ore and concentrate, clays, lead, gem stones, zinc. |
| Santa Cruz | 1,130,477 | 816,087 | Zinc, lead, silver, copper, sand and gravel, gold, gem stones. |
| Yavapai | 21,643,699 | 26,710,885 | Copper, zinc, cement, lead, gold, silver, stone, lime, sand and gravel, molybdenum, gypsum, gem stones, pumice, beryllium concentrate. |
| Yuma | 1,794,254 | 584,511 | Sand and gravel, gem stones, copper, gold, manganiferous ore and concentrate, lead, silver, mica (scrap), zinc. |
| Undistributed [3] | [1] 683,649 | 589,255 | |
| Total [4] | [1] 326,862,000 | 415,776,000 | |

[1] Revised figure.
[2] Petroleum value is preliminary.
[3] Includes tungsten concentrate (1960) and some manganese ore and concentrate (1959), stone (1960), manganiferous ore and concentrate (1960), sand and gravel (1960), and gem stones that cannot be assigned to specific counties.
[4] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.

**Cochise.**—Copper accounted for 88 percent ($38.9 million) of the $44.3 million value of mineral production in the county. Gold and silver output, recovered primarily as byproducts of copper ore, supplied 3 percent and 1 percent, respectively, of the total value. Other metals produced included lead, zinc, and uranium ore.

Copper Queen Branch, Phelps Dodge Corp., accounted for most of the copper and gold from its Copper Queen underground mine and Lavender open-pit mine at Bisbee. This operation was the State's fourth-largest copper producer. According to the company annual report, 509,700 tons of ore was produced from the Copper Queen mine, from which 25,575 tons of copper was recovered, and 4,245,000 tons of ore was produced from the Lavender mine, which yielded 33,248 tons of copper. The ratio of waste and leach material to ore mined at the Lavender pit increased to 2.73 to 1, compared with 1.51 to 1 in 1959, because of the increased stripping requirements in connection with the pit expansion program. Part of the ore from the Copper Queen mine was shipped to the company smelter at Douglas, and part was treated at the concentrator at Bisbee. All of the ore from the Lavender pit went to the concentrator. The concentrate and the precipitates from leaching were shipped to the Douglas smelter.

Johnson Camp—Burro and Chocora claims operated by Strong & Harris, Inc., and Moore shaft operated by McFarland & Hullinger—the county's second largest copper producer, was the principal zinc producer. Some lead and zinc was recovered from ores produced from the Burrito De Fierro and March mines, and a small quantity of copper came from the Paramount mine. A small quantity of uranium ore was produced at the Star No. 1 mine and shipped to the mill at Tuba City for processing.

Increased output of lime, pumice (scoria), sand and gravel, and stone resulted in nonmetallic production valued at $2.6 million, compared with $2.1 million in 1959. The Paul Lime Plant at Paul Spur was responsible for all the lime output and a portion of the increased production of limestone. San Xavier Rock & Sand Co. mined a larger quantity of scoria from its Bernardino scoria deposit for use at its Douglas building-block plant. Quarrying of sandstone used for smelter flux and crushed marble for terrazzo also increased. Crews of the State highway department produced all of the sand and gravel for road maintenance and construction. The Charleston mine of James Stewart Co. was active for only a short time during the year, and thus output of sericite mica was drastically reduced.

**Coconino.**—Nonmetallic mineral output in Coconino County was $5.4 million or 71 percent of the total value. Sand and gravel was the most important product in terms of value; crews of the State highway department produced the bulk of this material. The Federal Bureaus of Public Roads, Indian Affairs, and the Forest Service accounted for a large portion of the total stone quarried. Road construction and maintenance were the major uses. Dimension sandstone quarries in the county yielded 13,810 tons of flagging, rough construction and architectural stone, and rubble. The county was the principal source of pumice (scoria) in Arizona, with mining operations conducted by Atchison, Topeka & Santa Fe Railway Co., Paul Zanzucchi (Harenberg Block Co., Inc.), and Superlite Builders Supply Co.

Digitized by Google

Uranium ore production accounted for $2.2 million (29 percent) of the county's total value of mineral production. The county ranked second in the State in production of uranium ore. Except for a small quantity shipped to a mill in New Mexico, the entire output was processed at the Rare Metals Corporation of America mill at Tuba City. The leading producers were Western Gold & Uranium, Inc., operating the Orphan mine on the rim of the Grand Canyon, and Rare Metals Corp. at the Huskon group and other mines in the Cameron district. A number of independent operators in the Cameron district also produced uranium ore. The contract for the purchase of uranium oxide concentrate from the Tuba City mill by the AEC will terminate on March 31, 1962, and extension of the contract was largely dependent on the quantity and grade of ore that could be allocated to the Orphan mine, the principal mining operation in the State. Legislation was introduced in the Congress that would permit Western Gold & Uranium, Inc., to mine all uranium ore in the Orphan claim and in adjacent Grand Canyon National Park lands over a period of years; in exchange Western Gold & Uranium, Inc., would deed title to company-owned land in Grand Canyon National Park to the National Park Service. No action was taken on the proposed legislation, and the problem remained unsolved at the end of the year.

Coal was produced at the Cow Springs No. 3 mine by Lawrence Isaac Coal Co.

**Gila.**—Copper accounted for 97 percent ($45.6 million) of the value of all minerals produced in Gila County ($47.2 million). Most of the copper came from four principal producers—Inspiration, Copper Cities, Miami (in-place leaching), and Castle Dome (dump leaching).

The Inspiration mine, leaching plant, concentrator, smelter, and refinery of Inspiration Consolidated Copper Co., the sixth largest copper producer in the State, were operated at capacity throughout the year. Operations at the mine were scheduled to meet the ore demand for the metallurgical plants, partly on a 6-day-per-week and partly on a 7-day-per-week basis during the year. The leaching plant, concentrator, and refinery operated on a 7-day-per-week three shifts-per-day basis. The smelter operation was varied as necessary to handle the tonnage from the Inspiration mill and outside shippers. According to the company annual report, 5.3 million tons of ore was mined with a copper content of 0.396 percent in the oxide minerals and 0.482 percent in the sulfide minerals. A total of 4.1 million tons of waste was removed of which 1.2 million tons was segregated and placed on a dump for leaching to recover the contained copper. A total of 75.7 million pounds of copper or 15.89 pounds per ton of ore treated was recovered from Inspiration ore, and 5.1 million pounds was recovered from the leaching of dumps and ore in place. The Inspiration refinery was expanded during the year. Inspiration purchased the International Smelting and Refining Co. copper smelter at Inspiration and assumed operation of the plant on April 1. The company continued International's policy of buying and treating custom ores and concentrates. It also enlarged the refinery and purchased the smelter to anticipate increased production expected

Digitized by Google

from its Christmas mine and to reduce the costs of smelting and refining.

Development and construction activities at the Christmas underground copper mine by Inspiration continued throughout the year. Surface plant construction was on schedule, but a greater-than-expected inflow of water caused delays in the mine development schedule that possibly could defer the beginning of production until sometime in the first half of 1962.

The Copper Cities mining and milling operation, Miami leaching-in-place operation, and Castle Dome dump-leaching operation, the county's second, third, and fourth largest producers of copper, respectively, were acquired by the Tennessee Corp. from Miami Copper Co. on June 10 except for a royalty interest in the copper reserves, which was to be sold by Miami to institutional investors.

Most of the gold and silver production of the county was recovered as a byproduct of the treatment of copper ores by the leading producers. All of the molybdenum production was recovered from the Inspiration copper ore. Most of the lead was recovered from ore produced from the 79 Mine by Charles E. Goetz. Mercury output came from the Lola Lee mine operated by Jack Ralston.

Although there was a 9-percent decrease in the sales of asbestos fiber in 1960, the value rose 11 percent because of a higher average price for material sold. Mines in the vicinity of Globe were the source of all the asbestos produced in Arizona and the western United States.

Uranium ore from the Hope group of claims and the Little Joe mine was produced by H. C. Smith and Arizona Continental Uranium Co., respectively. All output was shipped to the mill at Tuba City for processing.

**Graham.**—Gem stones, pumice, and sand and gravel accounted for 97 percent of the total value of mineral production. Gila Cinder Co. continued to mine scoria from its deposit near Safford for use at the Gila Valley Block Co. plant. Contractors for the State highway department produced 120,700 tons of paving sand and gravel. Metals output (gold, silver, copper, lead, and zinc) came from copper and lead ores from the Coronado mine (L. Parcher) and Sein Fein mine (Holiday Mining Co.), respectively.

**Greenlee.**—The Morenci open-pit mine, operated by the Morenci Branch, Phelps Dodge Corp., was again the State's leading copper producer. It was the third largest molybdenum and silver producer and ranked sixth in output of gold, all recoverd as byproducts of copper ore. According to the company annual report, 35.7 million tons of material was handled, of which 14.5 million tons was ore. The ratio of waste and leach material to ore mined was 1.46 to 1. A total of 105,640 tons of copper was recovered from milling and leaching operations. In extending the pit mining area to include additional ore indicated by drilling, the company relocated former mine shop buildings. Two electric shovels with 9-cubic-yard dippers were purchased to replace two older shovels with 6-cubic-yard dippers. The company continued to operate a limekiln at the property to supply lime for metallurgical purposes.

Digitized by Google

Atlas mine (B. S. & K. Mining Co.), Johnson Camp mine, Moore shaft (McFarland & Hullinger), and the Flux mine (Nash & McFarland). These five producers accounted for 99 percent of the State's zinc output.

## NONMETALS

**Asbestos.**—Shipments of asbestos from mines near Globe, Gila County, continued to decline, dropping 9 percent below 1959. However, as a result of a higher average price for fiber sold, the total value for 1960 output was 11 percent above 1959. Except for a small quantity of grades 1, 2, and 3, shipments during the year were restricted to shorts and filter fiber. Producers in order of output were: Jaquays Mining Corp. (Regal and Chrysotile mines), Metate Asbestos Corp. (Metate), Kyle Asbestos Mines of Arizona (Sloan Creek), and LeTourneau Asbestos Corp. (Asbestos Peak).

A new mill was constructed about 2 miles east of Globe by LeTourneau Asbestos Corp. The mill processed ore from the Asbestos Peak and Bore Tree Saddle properties. GSA, pursuant to an announcement late in 1959 by OCDM, called for bids to supply nonferrous, soft asbestos of domestic origin for the national stockpile. The initial bids opened on April 29 were rejected, but new bids opened on June 7 indicated the following acceptable low bidders for No. 2 fiber: Jaquays Mining Corp., 450 tons at $918 per ton; Metate Asbestos Corp., 40 tons at $920; and Kyle Asbestos Mines of Arizona, 10 tons at $925. An initial shipment of 130 tons of No. 2 crude submitted to the Government on July 20 by two operators was rejected. No purchases were made by GSA during the year. A description of the Arizona asbestos industry was published.[5]

**Barite.**—A report was published discussing all known barite occurrences in Arizona as well as history, ownership, and production for most of the deposits.[6]

**Cement.**—On June 17 ceremonies were held at the Glen Canyon damsite observing the pouring of the first load of concrete. The cement for this concrete came from the Clarkdale plant of Phoenix Cement Co. Division, American Cement Corp.

Cement requirements for the construction of the dam and a gain in consumption of cement in industrial and residential construction boosted Arizona's cement sales 61 percent above the 1959 figure. All of the portland and masonry cements produced was consumed in Arizona, except for a small quantity exported.

Plans to expand operations at the two cement plants in the State were of major importance to the industrial growth of Arizona. A building permit was issued to Arizona Portland Cement Co. to construct five new storage silos, a new finishing mill, and loading facilities for both truck and rail shipments and to lengthen the Southern Pacific spur track to reach the new loading docks at the company Rillito plant. The plant had a daily capacity of 8,000 barrels with three kilns operating on a three-shift basis. In the latter part of 1960,

[5] Mining World, Arizona Asbestos Industry Is Growing Steadily Around Globe: Vol. 22, No. 10, September 1960, pp. 44–45.

[6] Stewart, L. A., and Pfister, A. J., Barite Deposits of Arizona: Bureau of Mines Rept. of Investigations 5651, 1960, 89 pp.

Digitized by Google

Phoenix Cement Co. announced plans to increase the capacity of its Clarkdale plant by 800,000 barrels annually by constructing an additional kiln. The new kiln will bring the plant capacity to 2.6 million barrels. Details and information about the new plant at Clarkdale were published.[7]

**Clays.**—Despite a 58-percent drop in the production of bentonite in Apache County, the overall output of all types of clay increased 18 percent over 1959. Gains in the production of miscellaneous clay and shale in Maricopa and Pinal Counties were responsible for the increase. The addition of the Phoenix Brick Yard to the list of active quarry operations accounted for the bulk of the increased production of miscellaneous clay and shale. Gila Pottery Co., operator of the Weary Lode in Gila County, went out of business during 1960.

**Feldspar.**—International Minerals & Chemical Corp. (IMC) continued to be the only producer of crude and ground feldspar. Sena Mining Co. was the mine operator, and all crude output was shipped to the Kingman mill of IMC for grinding. The bulk of the ground feldspar was shipped to consumers in California, although some shipments were reported to Ohio, Texas, Washington, Utah, and Mexico.

**Gem Stones.**—Interest in the collection of gem or ornamental stones by individuals, societies, and dealers resulted in the collection of an estimated $120,000 worth of material in 1960. This compared with a value of $88,000 in 1959. The collection of turquois and copper specimens in Gila County and petrified wood and various mineral specimens in Yavapai County accounted for 45 percent of the total value of all gem stones collected in 1960.

**Gypsum.**—The gypsum industry of Arizona continued to consist of three mining operations in Pinal County, and output was 16 percent above 1959. Arizona Gypsum Corp. mined gypsum near Winkelman and sold its uncalcined output for use as a portland-cement retarder and for agricultural purposes. Garcia & Peters Gypsum Co. sold crude gypsum from its Mammoth property for agricultural uses. Union Gypsum Co., with a wallboard and lathe plant at Phoenix, was acquired by National Gypsum Co. of Buffalo, N.Y., during 1960. The mining operation supplying crude gypsum was centered at the old Harless mines near Feldman. The crude ore was trucked to Winkelman for rail shipments to the Phoenix wallboard plant.

**Lime.**—Production (sold or used) of lime in Arizona rose 20 percent above comparable 1959 data. The same five lime-burning operations reporting in 1959 were active in 1960. Although the bulk of the lime sold or used in 1960 was consumed within the State, some shipments were made to California, Mexico, and New Mexico. The use of lime in the concentration of metallic ores (principally copper) accounted for 88 percent of all the lime sold or used. Other smaller uses included alkalies, sand-lime and slag brick, coke and gas, glass, open-hearth furnaces, and water purification. Kennecott Copper Corp. constructed a lime plant at its Ray copper concentrator at Hayden. The plant had five vertical kilns and was to supply lime for use as a conditioning

**Barite.**—A report was published discussing all known barite occurrences in Arizona as well as history, ownership, and production for most of the deposits.[6]

**Cement.**—On June 17 ceremonies were held at the Glen Canyon damsite observing the pouring of the first load of concrete. The cement for this concrete came from the Clarkdale plant of Phoenix Cement Co. Division, American Cement Corp.

Cement requirements for the construction of the dam and a gain in consumption of cement in industrial and residential construction boosted Arizona's cement sales 61 percent above the 1959 figure. All of the portland and masonry cements produced was consumed in Arizona, except for a small quantity exported.

Plans to expand operations at the two cement plants in the State were of major importance to the industrial growth of Arizona. A building permit was issued to Arizona Portland Cement Co. to construct five new storage silos, a new finishing mill, and loading facilities for both truck and rail shipments and to lengthen the Southern Pacific spur track to reach the new loading docks at the company Rillito plant. The plant had a daily capacity of 8,000 barrels with three kilns operating on a three-shift basis. In the latter part of 1960,

Phoenix Cement Co. announced plans to increase the capacity of its Clarkdale plant by 800,000 barrels annually by constructing an additional kiln. The new kiln will bring the plant capacity to 2.6 million barrels. Details and information about the new plant at Clarkdale were published.[7]

**Clays.**—Despite a 58-percent drop in the production of bentonite in Apache County, the overall output of all types of clay increased 18 percent over 1959. Gains in the production of miscellaneous clay and shale in Maricopa and Pinal Counties were responsible for the increase. The addition of the Phoenix Brick Yard to the list of active quarry operations accounted for the bulk of the increased production of miscellaneous clay and shale. Gila Pottery Co., operator of the Weary Lode in Gila County, went out of business during 1960.

**Feldspar.**—International Minerals & Chemical Corp. (IMC) continued to be the only producer of crude and ground feldspar. Sena Mining Co. was the mine operator, and all crude output was shipped to the Kingman mill of IMC for grinding. The bulk of the ground feldspar was shipped to consumers in California, although some shipments were reported to Ohio, Texas, Washington, Utah, and Mexico.

**Gem Stones.**—Interest in the collection of gem or ornamental stones by individuals, societies, and dealers resulted in the collection of an estimated $120,000 worth of material in 1960. This compared with a value of $88,000 in 1959. The collection of turquois and copper specimens in Gila County and petrified wood and various mineral specimens in Yavapai County accounted for 45 percent of the total value of all gem stones collected in 1960.

**Gypsum.**—The gypsum industry of Arizona continued to consist of three mining operations in Pinal County, and output was 16 percent above 1959. Arizona Gypsum Corp. mined gypsum near Winkelman and sold its uncalcined output for use as a portland-cement retarder and for agricultural purposes. Garcia & Peters Gypsum Co. sold crude gypsum from its Mammoth property for agricultural uses. Union Gypsum Co., with a wallboard and lathe plant at Phoenix, was acquired by National Gypsum Co. of Buffalo, N.Y., during 1960. The mining operation supplying crude gypsum was centered at the old Harless mines near Feldman. The crude ore was trucked to Winkelman for rail shipments to the Phoenix wallboard plant.

**Lime.**—Production (sold or used) of lime in Arizona rose 20 percent above comparable 1959 data. The same five lime-burning operations reporting in 1959 were active in 1960. Although the bulk of the lime sold or used in 1960 was consumed within the State, some shipments were made to California, Mexico, and New Mexico. The use of lime in the concentration of metallic ores (principally copper) accounted for 88 percent of all the lime sold or used. Other smaller uses included alkalies, sand-lime and slag brick, coke and gas, glass, open-hearth furnaces, and water purification. Kennecott Copper Corp. constructed a lime plant at its Ray copper concentrator at Hayden. The plant had five vertical kilns and was to supply lime for use as a conditioning

Atlas mine (B. S. & K. Mining Co.), Johnson Camp mine, Moore shaft (McFarland & Hullinger), and the Flux mine (Nash & McFarland). These five producers accounted for 99 percent of the State's zinc output.

## NONMETALS

**Asbestos.**—Shipments of asbestos from mines near Globe, Gila County, continued to decline, dropping 9 percent below 1959. However, as a result of a higher average price for fiber sold, the total value for 1960 output was 11 percent above 1959. Except for a small quantity of grades 1, 2, and 3, shipments during the year were restricted to shorts and filter fiber. Producers in order of output were: Jaquays Mining Corp. (Regal and Chrysotile mines), Metate Asbestos Corp. (Metate), Kyle Asbestos Mines of Arizona (Sloan Creek), and LeTourneau Asbestos Corp. (Asbestos Peak).

A new mill was constructed about 2 miles east of Globe by LeTourneau Asbestos Corp. The mill processed ore from the Asbestos Peak and Bore Tree Saddle properties. GSA, pursuant to an announcement late in 1959 by OCDM, called for bids to supply nonferrous, soft asbestos of domestic origin for the national stockpile. The initial bids opened on April 29 were rejected, but new bids opened on June 7 indicated the following acceptable low bidders for No. 2 fiber: Jaquays Mining Corp., 450 tons at $918 per ton; Metate Asbestos Corp., 40 tons at $920; and Kyle Asbestos Mines of Arizona, 10 tons at $925. An initial shipment of 130 tons of No. 2 crude submitted to the Government on July 20 by two operators was rejected. No purchases were made by GSA during the year. A description of the Arizona asbestos industry was published.[5]

**Barite.**—A report was published discussing all known barite occurrences in Arizona as well as history, ownership, and production for most of the deposits.[6]

**Cement.**—On June 17 ceremonies were held at the Glen Canyon damsite observing the pouring of the first load of concrete. The cement for this concrete came from the Clarkdale plant of Phoenix Cement Co. Division, American Cement Corp.

Cement requirements for the construction of the dam and a gain in consumption of cement in industrial and residential construction boosted Arizona's cement sales 61 percent above the 1959 figure. All of the portland and masonry cements produced was consumed in Arizona, except for a small quantity exported.

Plans to expand operations at the two cement plants in the State were of major importance to the industrial growth of Arizona. A building permit was issued to Arizona Portland Cement Co. to construct five new storage silos, a new finishing mill, and loading facilities for both truck and rail shipments and to lengthen the Southern Pacific spur track to reach the new loading docks at the company Rillito plant. The plant had a daily capacity of 8,000 barrels with three kilns operating on a three-shift basis. In the latter part of 1960,

Phoenix Cement Co. announced plans to increase the capacity of its Clarkdale plant by 800,000 barrels annually by constructing an additional kiln. The new kiln will bring the plant capacity to 2.6 million barrels. Details and information about the new plant at Clarkdale were published.[7]

**Clays.**—Despite a 58-percent drop in the production of bentonite in Apache County, the overall output of all types of clay increased 18 percent over 1959. Gains in the production of miscellaneous clay and shale in Maricopa and Pinal Counties were responsible for the increase. The addition of the Phoenix Brick Yard to the list of active quarry operations accounted for the bulk of the increased production of miscellaneous clay and shale. Gila Pottery Co., operator of the Weary Lode in Gila County, went out of business during 1960.

**Feldspar.**—International Minerals & Chemical Corp. (IMC) continued to be the only producer of crude and ground feldspar. Sena Mining Co. was the mine operator, and all crude output was shipped to the Kingman mill of IMC for grinding. The bulk of the ground feldspar was shipped to consumers in California, although some shipments were reported to Ohio, Texas, Washington, Utah, and Mexico.

**Gem Stones.**—Interest in the collection of gem or ornamental stones by individuals, societies, and dealers resulted in the collection of an estimated $120,000 worth of material in 1960. This compared with a value of $88,000 in 1959. The collection of turquois and copper specimens in Gila County and petrified wood and various mineral specimens in Yavapai County accounted for 45 percent of the total value of all gem stones collected in 1960.

**Gypsum.**—The gypsum industry of Arizona continued to consist of three mining operations in Pinal County, and output was 16 percent above 1959. Arizona Gypsum Corp. mined gypsum near Winkelman and sold its uncalcined output for use as a portland-cement retarder and for agricultural purposes. Garcia & Peters Gypsum Co. sold crude gypsum from its Mammoth property for agricultural uses. Union Gypsum Co., with a wallboard and lathe plant at Phoenix, was acquired by National Gypsum Co. of Buffalo, N.Y., during 1960. The mining operation supplying crude gypsum was centered at the old Harless mines near Feldman. The crude ore was trucked to Winkelman for rail shipments to the Phoenix wallboard plant.

**Lime.**—Production (sold or used) of lime in Arizona rose 20 percent above comparable 1959 data. The same five lime-burning operations reporting in 1959 were active in 1960. Although the bulk of the lime sold or used in 1960 was consumed within the State, some shipments were made to California, Mexico, and New Mexico. The use of lime in the concentration of metallic ores (principally copper) accounted for 88 percent of all the lime sold or used. Other smaller uses included alkalies, sand-lime and slag brick, coke and gas, glass, open-hearth furnaces, and water purification. Kennecott Copper Corp. constructed a lime plant at its Ray copper concentrator at Hayden. The plant had five vertical kilns and was to supply lime for use as a conditioning

agent in copper flotation. No production was reported in 1960 for the new plant.

**Mica.**—An increase in the demand for ground mica by roofing paper and paint manufacturers resulted in a substantial gain in the mine production of scrap mica. The Buckeye Mica Co., with a mill at Buckeye and mines near Quartzite and Buckeye, accounted for nearly all of the production. James Stewart Co. produced a small quantity of ground mica from a gougelike material recovered from the Charleston mine near Tombstone. During 1960 the Tombstone Mica Co., Inc., leased the Charleston mine and laid out a development program.

**Nitrogen Compounds.**—Randall Mills Corp., operator of Bat Cave 600 feet above the Colorado River in Grand Canyon, did not produce or sell any guano during 1960.

**Perlite.**—Although Tucson Perlite, Inc., did not mine any perlite in 1960, output for the State was 5 percent above that of 1959. Increased production from the Superior operation of Harborlite Corp. was responsible for the gain. Arizona Perlite Roofs, Inc., new name for Perlite Industries of Arizona, Inc., Pinal County mining operation, produced less perlite in 1960 than in 1959. Expanding plants were operated at Phoenix by Perlite Industries of Arizona and at Tucson by Tucson Perlite, Inc. The latter plant used crude perlite mined in 1959. Building plaster, loose-fill insulation, concrete aggregate, and block manufacturing consumed all of the expanded perlite produced in 1960. Harborlite Corp. shipped its crude output to a company-owned plant in California.

**Pumice.**—Production and sales of pumice (scoria) continued to climb, reaching 703,000 tons, 44 percent above 1959. All six mining operations in the State recorded gains in output. The Atchison, Topeka and Santa Fe Railway Co. operated its Darling pit near Winona and was the largest producer; all the output was used for railroad ballast. The need for scoria in the manufacture of building block and for fill consumed all of the mine production of Superlite Builders Supply Co. and Paul Zanzucchi (supplying crude material to Harenberg Block Co., Inc., of Flagstaff). San Xavier Rock & Sand Co. continued to quarry scoria from its Douglas pit as did Gila Cinder Co. from its Graham County operation. Yavapai Block Co. near Ashfork began mining in 1960, at the Cruice cinder pit.

**Pyrites.**—Production of pyrites was slightly more than double the 1959 total. Kennecott Copper Corp., at Hayden, accounted for the bulk of the output. Magma Copper Co. shipped a small quantity to Kennecott; all the pyrite was consumed at the sulfuric acid plant of Kennecott at Hayden. Crude sulfur from Texas was used in the manufacture of sulfuric acid at plants near Benson, Chandler, and Inspiration. A contact sulfuric acid plant was under construction by Bagdad Copper Corp. at Bagdad. Crude sulfur will be used as the raw material.

**Sand and Gravel.**—An 8-percent increase in the production and use of sand and gravel raised the State total to 14.5 million tons valued at $14.2 million. Commercial output accounted for 44 percent, and Government-and-contractor production accounted for 56 percent of the total production. Maricopa County was the center of production

Digitized by Google

activity, with an output of nearly 6 million tons. A report [8] showed that from July 1956 to January 1961 Arizona completed, to full or acceptable interstate standards, 201.9 miles of road plus 312.4 miles of highway adequate for present traffic, for a total of 514.3 miles open to traffic. On the basis of completed mileage, Arizona ranked sixth in the Nation. However, in terms of work in progress on the interstate system, Arizona ranked 33d, with 167.5 miles in construction, engineering, or right-of-way status.

**Stone.**—Production of all types of stone rose to 4.2 million tons valued at $5.1 million, compared with 2.5 million tons and $4 million in 1959. Sixty-seven percent of the tonnage increase was accounted for by the Federal Bureaus of Indian Affairs and Public Roads which quarried basalt, limestone, and miscellaneous stone. A gain in the output of limestone used in the manufacture of cement and lime was largely responsible for an increase in commercial stone production.

**Vermiculite.**—Crude vermiculite from Montana was exfoliated at the Glendale plant of Ari-Zonolite Co. Output of finished product was 45 percent greater and was used as insulation, and in plaster and concrete aggregate, agriculture, and acoustical products.

## MINERAL FUELS

**Coal.**—Coal production, from the Cow Spring No. 3 mine in Coconino County and the Keams Canyon No. 4 mine in Navajo County, was 14 percent below that of 1959.

**Petroleum and Natural Gas.**—Petroleum production which came from three fields in Apache County, was 73,000 barrels, nearly three times that of 1959. During the year 39 wells were completed—20 exploratory and 19 development. Of the 20 exploratory wells, 1 was listed as a discovery. The discovery well was in the southern portion of the Paradox Basin 2.5 miles northwest of the Bita Peak field. Initial production was 8 barrels of oil a day, on pump, from the McCracken (Devonian) formation at a depth of 6,758 to 6,794 feet. Two successful development wells were completed in the Dry Mesa field. Additional drilling was done in the Pinta Dome area, primarily for the development of shallow helium gas reserves. Drilling activity was uneventful; however, an increased interest in the possibility of substantial production was evidenced by a rise in leasing, which reached 2 million acres during the year.

## REVIEW BY COUNTIES

**Apache.**—Output of uranium ore and byproduct vanadium from uranium-ore milling accounted for three-quarters of the $5.2 million value of mineral production in the county. Apache County led the State in the production of these two commodities. Uranium ore,

Digitized by Google

nearly all of which was processed at mills in Colorado and New Mexico, was produced at 19 operations. Principal producers were Kerr-McGee Oil Industries, Inc., at the Mesa group mines and VCA at the Monument No. 2 mine. Most of the uranium ores mined contained a significant quantity of vanadium which was recovered from those ores processed at mills equipped with vanadium-recovery units, in Colorado and New Mexico. The quantity of vanadium recovered was substantially greater than in 1959.

Petroleum production from three fields nearly tripled that of 1959. Of the 39 wells drilled in the State, 34 were in Apache County. Drilling totaled 81,763 feet. Three of the wells completed (one exploratory and two development) were successful.

The production of nonswelling bentonite by Alba Mining Co. in the Sanders area continued to decline. A shift in highway construction resulted in a substantial drop in output of sand and gravel, but because of road construction by the Federal Bureaus of Indian Affairs, Forest Service, and Public Roads, output of stone rose from 35,700 tons in 1959 to 641,600 in 1960.

**TABLE 15.—Value of mineral production in Arizona, by counties**

| County | 1959 | 1960 | Minerals produced in 1960, in order of value |
|---|---|---|---|
| Apache | [1] $4,253,943 | [2] $5,212,471 | Uranium ore, vanadium, stone, sand and gravel, petroleum, clays, gem stones. |
| Cochise | 31,963,199 | 44,255,697 | Copper, gold, lime, stone, sand and gravel, zinc, silver, pumice, lead, gem stones, mica (scrap), uranium ore. |
| Coconino | 4,884,107 | 7,622,708 | Sand and gravel, uranium ore, stone, pumice, coal, gem stones. |
| Gila | 50,239,827 | 47,186,532 | Copper, molybdenum, asbestos, sand and gravel, silver, lime, uranium ore, stone, gold, gem stones, lead, mercury, zinc. |
| Graham | 153,582 | 150,596 | Sand and gravel, pumice, lead, gem stones, copper, zinc, silver, gold. |
| Greenlee | 48,084,455 | 70,413,650 | Copper, molybdenum, lime, silver, gold stone, gem stones. |
| Maricopa | 6,698,542 | 6,384,838 | Sand and gravel, mica (scrap), clays, manganese ore and concentrate, manganiferous ore and concentrate, mercury, gem stones, silver, copper, stone, gold. |
| Mohave | 982,759 | 346,651 | Sand and gravel, stone, feldspar, silver, manganiferous ore and concentrate, lead, copper, zinc, gem stones, gold. |

[1] Revised figure.
[2] Petroleum value is preliminary.
[3] Includes tungsten concentrate (1960) and some manganese ore and concentrate (1959), stone (1960), manganiferous ore and concentrate (1960), sand and gravel (1960), and gem stones that cannot be assigned to specific counties.
[4] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.

Digitized by Google

**Cochise.**—Copper accounted for 88 percent ($38.9 million) of the $44.3 million value of mineral production in the county. Gold and silver output, recovered primarily as byproducts of copper ore, supplied 3 percent and 1 percent, respectively, of the total value. Other metals produced included lead, zinc, and uranium ore.

Copper Queen Branch, Phelps Dodge Corp., accounted for most of the copper and gold from its Copper Queen underground mine and Lavender open-pit mine at Bisbee. This operation was the State's fourth-largest copper producer. According to the company annual report, 509,700 tons of ore was produced from the Copper Queen mine, from which 25,575 tons of copper was recovered, and 4,245,000 tons of ore was produced from the Lavender mine, which yielded 33,248 tons of copper. The ratio of waste and leach material to ore mined at the Lavender pit increased to 2.73 to 1, compared with 1.51 to 1 in 1959, because of the increased stripping requirements in connection with the pit expansion program. Part of the ore from the Copper Queen mine was shipped to the company smelter at Douglas, and part was treated at the concentrator at Bisbee. All of the ore from the Lavender pit went to the concentrator. The concentrate and the precipitates from leaching were shipped to the Douglas smelter.

Johnson Camp—Burro and Chocora claims operated by Strong & Harris, Inc., and Moore shaft operated by McFarland & Hullinger—the county's second largest copper producer, was the principal zinc producer. Some lead and zinc was recovered from ores produced from the Burrito De Fierro and March mines, and a small quantity of copper came from the Paramount mine. A small quantity of uranium ore was produced at the Star No. 1 mine and shipped to the mill at Tuba City for processing.

Increased output of lime, pumice (scoria), sand and gravel, and stone resulted in nonmetallic production valued at $2.6 million, compared with $2.1 million in 1959. The Paul Lime Plant at Paul Spur was responsible for all the lime output and a portion of the increased production of limestone. San Xavier Rock & Sand Co. mined a larger quantity of scoria from its Bernardino scoria deposit for use at its Douglas building-block plant. Quarrying of sandstone used for smelter flux and crushed marble for terrazzo also increased. Crews of the State highway department produced all of the sand and gravel for road maintenance and construction. The Charleston mine of James Stewart Co. was active for only a short time during the year, and thus output of sericite mica was drastically reduced.

**Coconino.**—Nonmetallic mineral output in Coconino County was $5.4 million or 71 percent of the total value. Sand and gravel was the most important product in terms of value; crews of the State highway department produced the bulk of this material. The Federal Bureaus of Public Roads, Indian Affairs, and the Forest Service accounted for a large portion of the total stone quarried. Road construction and maintenance were the major uses. Dimension sandstone quarries in the county yielded 13,810 tons of flagging, rough construction and architectural stone, and rubble. The county was the principal source of pumice (scoria) in Arizona, with mining operations conducted by Atchison, Topeka & Santa Fe Railway Co., Paul Zanzucchi (Harenberg Block Co., Inc.), and Superlite Builders Supply Co.

Digitized by Google

Uranium ore production accounted for $2.2 million (29 percent) of the county's total value of mineral production. The county ranked second in the State in production of uranium ore. Except for a small quantity shipped to a mill in New Mexico, the entire output was processed at the Rare Metals Corporation of America mill at Tuba City. The leading producers were Western Gold & Uranium, Inc., operating the Orphan mine on the rim of the Grand Canyon, and Rare Metals Corp. at the Huskon group and other mines in the Cameron district. A number of independent operators in the Cameron district also produced uranium ore. The contract for the purchase of uranium oxide concentrate from the Tuba City mill by the AEC will terminate on March 31, 1962, and extension of the contract was largely dependent on the quantity and grade of ore that could be allocated to the Orphan mine, the principal mining operation in the State. Legislation was introduced in the Congress that would permit Western Gold & Uranium, Inc., to mine all uranium ore in the Orphan claim and in adjacent Grand Canyon National Park lands over a period of years; in exchange Western Gold & Uranium, Inc., would deed title to company-owned land in Grand Canyon National Park to the National Park Service. No action was taken on the proposed legislation, and the problem remained unsolved at the end of the year.

Coal was produced at the Cow Springs No. 3 mine by Lawrence Isaac Coal Co.

**Gila.**—Copper accounted for 97 percent ($45.6 million) of the value of all minerals produced in Gila County ($47.2 million). Most of the copper came from four principal producers—Inspiration, Copper Cities, Miami (in-place leaching), and Castle Dome (dump leaching).

The Inspiration mine, leaching plant, concentrator, smelter, and refinery of Inspiration Consolidated Copper Co., the sixth largest copper producer in the State, were operated at capacity throughout the year. Operations at the mine were scheduled to meet the ore demand for the metallurgical plants, partly on a 6-day-per-week and partly on a 7-day-per-week basis during the year. The leaching plant, concentrator, and refinery operated on a 7-day-per-week three shifts-per-day basis. The smelter operation was varied as necessary to handle the tonnage from the Inspiration mill and outside shippers. According to the company annual report, 5.3 million tons of ore was mined with a copper content of 0.396 percent in the oxide minerals and 0.482 percent in the sulfide minerals. A total of 4.1 million tons of waste was removed of which 1.2 million tons was segregated and placed on a dump for leaching to recover the contained copper. A total of 75.7 million pounds of copper or 15.89 pounds per ton of ore treated was recovered from Inspiration ore, and 5.1 million pounds was recovered from the leaching of dumps and ore in place. The Inspiration refinery was expanded during the year. Inspiration purchased the International Smelting and Refining Co. copper smelter at Inspiration and assumed operation of the plant on April 1. The company continued International's policy of buying and treating custom ores and concentrates. It also enlarged the refinery and purchased the smelter to anticipate increased production expected

Digitized by Google

from its Christmas mine and to reduce the costs of smelting and refining.

Development and construction activities at the Christmas underground copper mine by Inspiration continued throughout the year. Surface plant construction was on schedule, but a greater-than-expected inflow of water caused delays in the mine development schedule that possibly could defer the beginning of production until sometime in the first half of 1962.

The Copper Cities mining and milling operation, Miami leaching-in-place operation, and Castle Dome dump-leaching operation, the county's second, third, and fourth largest producers of copper, respectively, were acquired by the Tennessee Corp. from Miami Copper Co. on June 10 except for a royalty interest in the copper reserves, which was to be sold by Miami to institutional investors.

Most of the gold and silver production of the county was recovered as a byproduct of the treatment of copper ores by the leading producers. All of the molybdenum production was recovered from the Inspiration copper ore. Most of the lead was recovered from ore produced from the 79 Mine by Charles E. Goetz. Mercury output came from the Lola Lee mine operated by Jack Ralston.

Although there was a 9-percent decrease in the sales of asbestos fiber in 1960, the value rose 11 percent because of a higher average price for material sold. Mines in the vicinity of Globe were the source of all the asbestos produced in Arizona and the western United States.

Uranium ore from the Hope group of claims and the Little Joe mine was produced by H. C. Smith and Arizona Continental Uranium Co., respectively. All output was shipped to the mill at Tuba City for processing.

**Graham.**—Gem stones, pumice, and sand and gravel accounted for 97 percent of the total value of mineral production. Gila Cinder Co. continued to mine scoria from its deposit near Safford for use at the Gila Valley Block Co. plant. Contractors for the State highway department produced 120,700 tons of paving sand and gravel. Metals output (gold, silver, copper, lead, and zinc) came from copper and lead ores from the Coronado mine (L. Parcher) and Sein Fein mine (Holiday Mining Co.), respectively.

**Greenlee.**—The Morenci open-pit mine, operated by the Morenci Branch, Phelps Dodge Corp., was again the State's leading copper producer. It was the third largest molybdenum and silver producer and ranked sixth in output of gold, all recoverd as byproducts of copper ore. According to the company annual report, 35.7 million tons of material was handled, of which 14.5 million tons was ore. The ratio of waste and leach material to ore mined was 1.46 to 1. A total of 105,640 tons of copper was recovered from milling and leaching operations. In extending the pit mining area to include additional ore indicated by drilling, the company relocated former mine shop buildings. Two electric shovels with 9-cubic-yard dippers were purchased to replace two older shovels with 6-cubic-yard dippers. The company continued to operate a limekiln at the property to supply lime for metallurgical purposes.

Digitized by Google

**Maricopa.**—Mainly because of a substantial drop in the shipment of manganese ore and concentrates (35 percent or more Mn) and an equally significant gain in the consumption of sand and gravel, the contribution of nonmetallic production to the total value of all minerals produced rose to 98 percent compared with 81 percent in 1959. Maricopa County was the leading producer of sand and gravel in the State with output reaching nearly 6 million tons, a 27-percent increase over 1959. Fourteen commercial operations produced 4.7 million tons, and Government-and-contractor operations produced the remainder. Union Rock & Materials Co. and Superior Sand & Gravel Division, Fisher Contracting Co., were the principal commercial producers. Wallapai Brick & Clay Products, Inc., and Phoenix Brick Yard operated brick and heavy clay products plants using miscellaneous clay and shale mined within the county. The grinding mill of Buckeye Mica Co. operated on an accelerated basis during the year, and sales were considerably higher than in 1959.

The decline in manganese ore and concentrate production (shipments) resulted from the completion of the Government carlot-purchase program in 1959. The small quantities of manganese concentrate shipped in 1960 were recovered by treating manganese mill tailings. Some manganiferous ore was shipped from the Black Rock mine to the Kaiser Steel Corp., Fontana, Calif., by Mohave Mining and Milling Co. Mercury was produced from the Turn Bull mine by Reeves, Grimes & Peterson and from the Oneida mine by the Oneida Mining Co. Small quantities of gold, silver, and copper came from six lode mines and ore processors.

**Mohave.** Sand and gravel, stone, feldspar, and gem stones accounted [illegible] of the county's mineral production. [illegible] and sand and gravel and feldspar at its Kingman mill. This [illegible] ground gravel, which accounted for the bulk of the stone [illegible].

[illegible] for the small amounts of gold, silver, copper, [illegible]. The Oneida and Blackstone mines were the principal [illegible].

[illegible] for three-quarters of the total value [illegible] in the form of [illegible]. The [illegible] Silverado No. 1 and [illegible] [illegible] [illegible]

byproducts of copper ore. All of the molybdenum produced came from copper ore treated at the Esperanza and Silver Bell operations.

In its annual report, Phelps Dodge Corp. reported that 23,721,000 tons of material was handled from the Ajo open-pit mine by the New Cornelia Branch operation; 9,066,000 tons was ore and 14,655,000 tons was waste material. From the ore milled, 66,693 tons of copper was produced.

Duval Sulphur & Potash Co. completed the first full year of operation at its Esperanza copper property. Production was maintained at the maximum level throughout the year, and the average milling rate was 11,600 tons of ore per day. The marketed products were copper concentrate and molybdic trioxide.

At the Silver Bell mine, the Silver Bell Unit of Asarco continued to mine copper ore from the Oxide and El Tiro open-pit mines. A substantial quantity of exploration and development diamond drilling was conducted.

Cyprus Mines Corp., which owned 50 percent of the Pima Mining Co., stated in its annual report that 1,327,473 tons of ore containing 1.14 percent copper was produced from the Pima mine and was concentrated at the company mill in 1960. Mill alterations to increase the capacity from 3,000 to 3,800 tons per day were completed. An agreement was reached with Banner Mining Co. under which Pima would mine and mill an estimated 1.8 million tons of Banner's ore. Stripping was ahead of schedule at the close of the year. Mining of Banner's ore by Pima was to begin in 1962. Banner decided to stop production from the Daisy underground mine because of the proximity of the Pima open-pit operation.

The Banner Mining Co. Palo Verde shaft was completed to its final depth of 960 feet by October. The company started cutting stations and ore and waste pockets on the 700, 800, and 900 levels. By yearend, 100 tons of ore per day was being mined from development work on the Palo Verde mine.

The Atlas mine, operated by B. S. & K. Mining Co., was the principal producer of zinc in the county.

Cement was the second-ranking commodity in terms of value, and shipments of portland and masonry cement from the Rillito plant of Arizona Portland Cement Co. were 15 percent greater than in 1959. Except for a small quantity of limestone used for roofing granules, all of the limestone quarried in 1960 was used in manufacturing cement. Crushed marble, used as roofing granules, and crushed sandstone, used as riprap and smelter flux, were also quarried. Devry Brick Co., Inc., Grabe Brick Co., and Tucson Pressed Brick Co. produced miscellaneous clay and shale for use at their respective plants in manufacturing brick and other heavy clay products. Tucson Perlite Co. did not mine any crude perlite in 1960, and its Tucson expanding plant operated on crude material mined in 1959.

**Pinal.**—Copper supplied $100 million (94 percent) of the $106.7 million value of mineral production. Output from three mines, San Manuel (second-largest copper producer in the State), Ray (fifth), and Magma (ninth) accounted for 99.8 percent of the county's and 29 percent of the State's copper production. Most of the gold and silver from the county was recovered as a byproduct of copper.

615629—61——9

Digitized by Google

All of the molybdenum was recovered as a byproduct of copper ore milling at San Manuel.

Magma Copper Co., sole owner of the San Manuel Copper Corp., announced in its annual report that 12,261,220 tons of ore with 0.71-percent copper in the sulfide minerals was mined from San Manuel in 1960. The copper contained in the oxide minerals in the ore was not recovered. Tons of ore mined per operating day averaged 34,249 for the year, compared with 32,741 in 1959 and 32,175 in 1958. Metal recovered from the ore milled included 81,724 tons of copper, 2.8 million pounds of molybdenum sulfide, 18,010 ounces of gold, and 290,617 ounces of silver. A cyanide plant for the recovery of gold from the molybdenum sulfide concentrate was completed and placed in operation in July. During the year, 296,804 tons of copper concentrate was processed at the smelter, an average of 847 tons per day of operation, and anode copper was produced.

According to the Kennecott Copper Corp. annual report, 6.5 million tons of ore was mined by the Ray Mines Division in 1960, compared with 3.0 million tons in 1959. Copper production from all Ray operations, mining and milling of ore and leaching of waste dumps and ore in place, was 58,799 tons of copper, compared with 29,084 tons in 1959. Expansion of productive capacity at the Ray Division was completed by the middle of the year. The $35 million program included enlargement of the pit, which necessitated the relocation of certain surface facilities to permit the mining of additional ore reserves; and increased mine equipment and mill capacity to make possible the mining and milling of 22,500 tons of ore a day compared with 15,000 tons formerly. The expansion enabled Ray Mines to produce 20,000 additional tons of copper a year, an increase of 40 percent.

Magma Copper Co., according to its annual report, produced 386,636 tons of ore assaying 5.10 percent copper, 0.04 ounces gold, and 1.73 ounces silver in 1960, compared with 276,387 tons assaying 5.23 percent copper, 0.04 ounces gold, and 1.50 ounces silver in 1959. In addition, 440 tons of custom ore was purchased and treated, compared with 106 tons in 1959. Mine production was resumed on January 19 after the strike settlement, and smelter operation was resumed on February 11 after repairs interrupted by the strike had been completed. Development work at the Magma mine during the year comprised 11,789 feet of drifts and crosscuts, 5,849 feet of raises, and 5,995 feet of diamond drilling.

All of the molybdenum and most of the gold and silver output in the county were recovered as byproducts from copper ore. Molybdenum, gold, and silver accounted for 4 percent of the county's value of mineral production.

Although nonmetals contributed only 2 percent of the total value of all mineral production, a number of the commodities in this group were necessary for the production of the more valuable metals. Some of the pyrite recovered from base-metal milling was roasted to produce sulfuric acid for copper leaching and sponge iron for precipitation. Lime produced by San Manuel Copper Corp. was used in its San Manuel concentrator, and quartzite quarried by the same company was used as flux in the treatment of copper ores. A portion of the

Digitized by Google

gypsum mined by Arizona Gypsum Co., Garcia & Peters, and National Gypsum was shipped to wallboard and cement plants but returned to the county as cement, wallboard, and other building products consumed by the mineral industry; some of the gypsum was used locally for agricultural purposes. Miscellaneous clay or shale mined by Phoenix Brick Yard was used in the manufacture of building brick and other clay products, and the crude perlite mined by Arizona Perlite Roofs, Inc., and Harborlite Corp. was expanded at Tucson and California expanding plants for use in building plaster and other construction applications. Four commercial and two Government-and-contractor producers mined 1.3 million tons of sand and gravel valued at $1.1 million. This material was used for building and paving construction, mostly in Pinal County. San Manuel Copper Corp. mined all of the crushed limestone and sandstone for use as smelter flux and in the manufacture of lime at its San Manuel Copper operation. A small quantity of crushed marble was quarried and used as roofing granules.

**Santa Cruz.**—Production of gold, silver, copper, lead, and zinc came from ore from three mines and cleanup at two mines. The Flux mine operated by Nash & McFarland was the principal producer. An average of 2,500 tons of ore per month from the Flux mine was treated in the Trench mill; in addition some custom ore was milled. In mid-year a crew of 38 men was employed: 29 in the mine and 7 in the mill, working 2 shifts per day, 6 days per week; and 2 in the shops, working 1 shift.

**Yavapai.**—Gold, silver, copper, lead, and zinc accounted for 79 percent of the value of mineral production. The Iron King mine at Humbolt, operated by the Iron King Branch of Shattuck Denn Mining Corp., was the State's leading silver, lead, and zinc producer and the third largest gold producer. According to the company report, operations continued throughout the year without interruption, and 304,735 tons of ore was mined.

The Bagdad Copper Corp. mine at Bagdad continued to be the principal producer of copper in the county and was the 12th largest producer in the State. Byproduct gold, silver, and molybdenum also were recovered. Production of copper nearly equaled that of 1959. Construction of a plant to produce copper by leaching stockpiled oxidized copper material was on schedule at the close of the year. The section to produce sulfuric acid from sulfur was completed and tested. The launders where copper is precipitated from copper solutions on detinned cans were completed. The final item, the piping and irrigation system to circulate the acid solution over the dumps, was nearly completed. The plant was expected to add 20 tons per day to the copper output of the operation.

The Old Dick mine, wholly owned and operated by Cyprus Mines Corp., was one of the county's leading copper (14th in the State) and zinc (2d in the State) producers. The company reported that 80,940 tons of ore, including a small tonnage of development ore from the adjacent Copper Queen mine, was mined and milled in 1960, compared with 76,111 tons in 1959. Plans were announced to increase the processing capacity of the property from 240 to 300 tons per day by

Digitized by Google

installing a heavy-medium separation plant to remove barren and low-grade material from the ore before grinding.

Other important metal producers in the county included Big Hole Mining Co., which produced copper ore from the United Verde open-pit mine (formerly operated by Phelps Dodge Corp.), and Fred D. Schemmer, who operated the Commercial mine under lease from Phelps Dodge Corp. and produced fluxing copper ore for the Phelps Dodge smelter at Douglas. Earl Anderson recovered a small quantity of hand-cobbed beryl concentrate from the Homestead Lode.

The first full year's operation of the Phoenix Cement Co. plant at Clarkdale resulted in a substantial increase in the value of cement sold in the county; cement ranked third in terms of value. Phoenix Cement Co. also operated the Redwall and Lakebed quarries to supply cement rock to its Clarkdale plant. Arizona Gypsum Co. mined gypsum from the Camp Verde deposit for use in manufacturing cement. The Flintkote Co. reduced the output of lime from its Nelson plant 12 percent. Scoria was added to the list of nonmetals produced in the county and was produced by Yavapai Block Co. from its Cruice cinder pit near Ashfork.

**Yuma.**—The county highway department and contractors for the State highway department and the Federal Bureaus of Public Roads and Reclamation produced 594,600 tons of structural and paving sand and gravel. Buckeye Mica Co. mined sericite mica from its property near Quartzite.

Gold, silver, and copper were recovered from small lots of ore produced from seven lode mines; silver, lead, and zinc were recovered from tailings and cleanup material from two operations; and copper was recovered from copper precipitates at one operation.

Digitized by Google

# The Mineral Industry of Arkansas

**This chapter has been prepared under a cooperative agreement for the collection of mineral data between the Bureau of Mines, U.S. Department of the Interior, and the Arkansas Geological and Conservation Commission, Norman F. Williams, Director and State Geologist, Little Rock, Ark.**

By Harry F. Robertson [1] and Raymond B. Stroud [2]

VALUE of mineral production in Arkansas in 1960 increased 9 percent over 1959. The record value of $155 million reflects the continued growth of the mineral industry and represents a 16 percent increase since 1955. In 1960, gains were reported in the value of bauxite, clays, gem stones, natural gas, natural gas liquids, crude petroleum, and stone; decreases were noted in the value of barite, coal, and sand and gravel. Emphasis continued on development of new industries.

Construction began on Beaver Dam, the fourth major project in the upper White River basin for control and development of the river and its tributaries. The dam will be located 8 miles west of Eureka Springs and will consist of a concrete barrier 1,333 feet long and 228 feet above the stream bed, supplemented by all-earth structures where needed on the reservoir rim. In addition to flood control and hydroelectric power, the dam will create a reservoir extending upstream to the vicinity of Fayetteville. Construction of the dam, embankment, and dikes will require an estimated 539,000 cubic yards of excavation, 1,327,000 cubic yards of fill, 754,000 cubic yards of concrete, and 1,400 tons of reinforcing steel. Aggregate for the concrete will be obtained from a limestone quarry near the damsite.

Dardanelle Lock and Dam project continued on schedule during the year and, at yearend, was 12 percent complete. Future work includes relocation of cemeteries, powerlines, gaslines, and highways, and procurement and installation of four turbines and four generators.

Greers Ferry Dam, a multiple-purpose project on the Little Red River near Heber Springs, was 41 percent complete. Construction of the powerhouse was scheduled to start about mid-1961 and will complete the $56 million project.

Other new and expanded markets for the State's mineral resources resulted from construction projects such as the $10 million plant of Norge Division of Borg-Warner Corp. at Fort Smith, the Crane Co. $6.5 million installation at Jonesboro, and the Seiberling Rubber Corp.

[5] Total adjusted to eliminate duplicating value of clays and stone.

plant at Batesville. Two major projects at Helena—the Mississippi River bridge and the Arkansas Power and Light Co. generating plant—were completed during the year.

**Employment and Injuries.**—Employment in all categories of the mining industry dropped sharply and was 10 percent lower than that reported in 1959. The mining industry annual payroll decreased 9.5 percent; however, the overall average of weekly wage rates increased 1 percent. Average weekly wages were: $115.92 in the metal mining industry, a gain of 8 percent over 1959; $93.35 in the coal industry, a gain of 3 percent; $91.59 in the crude petroleum and natural gas industry, essentially unchanged; and $76.31 in the nonmetal mining and quarrying industries, a decrease of 1 percent.

# REVIEW BY MINERAL COMMODITIES

## MINERAL FUELS

**Coal.**—The number of bituminous coal mines operated during the year was unchanged from 1959—10 underground and 10 strip-mines. Output from underground mines accounted for 27 percent; that from open-pit mines for 73 percent of the total production of 409,199 short tons of coal. Total production decreased 7 percent in quantity and 10 in value, compared with 1959, because of a significant decrease in output from underground mines.

**TABLE 3.—Coal production**

(Thousand short tons and thousand dollars)

| Year | Short tons | Value | Year | Short tons | Value |
|---|---|---|---|---|---|
| 1951-55 (average) | 762 | $5,916 | 1958 | 364 | $2,744 |
| 1956 | 590 | 4,601 | 1959 | 441 | 3,482 |
| 1957 | 508 | 3,976 | 1960 | 409 | 3,116 |

At the 10 strip mines, 6 million cubic yards of overburden was excavated and 296,425 tons of coal loaded—a stripping ratio of 20 cubic yards of overburden to 1 ton of coal mined.

**Oil and Gas Exploration and Development.**—Drilling activity in 86 fields in 21 counties resulted in completion of 285 oil wells, 39 gas wells, and 257 dry holes. The total number of holes drilled decreased 23 percent. The reduced drilling activity was attributed mainly to loss of part of the State's crude oil market. Significant decreases in development drilling were noted in Union, Ouachita, Nevada, and Columbia Counties.

During 1960, 56 percent of the wells drilled were completed as producers of oil or gas; 35 wells were successfully completed as new sources of supply, establishing 8 new fields (3 oil and 5 gas) and 27 new pools (19 oil and 8 gas). Successful outpost wells established significant lateral extensions of at least 15 fields during the year.

The deepest well drilled in 1960 was in Lafayette County and was completed as a producer in the Smackover formation at a total depth of 11,509 feet. The record producing depth, about 11,015 feet, was established in 1960 in the newly discovered Lake Erling oilfield in Lafayette County.

In north Arkansas, dry natural gas was produced from relatively shallow sands of Pennsylvanian, Mississippian, and Devonian ages. Drilling activity in this part of the State resulted in discovery of four new gasfields and five new sources of gas supply. At yearend, there were 50 gasfields in the north Arkansas area.

In south Arkansas, oil and gas production came from Cretaceous and Jurassic formations. Exploratory and development drilling, conducted in 10 counties and 63 fields, totaled 528 wells. Of the wells drilled, 127 were wildcat and resulted in the discovery of 4 new fields (3 oil and 1 gas) and 20 new pools (19 oil and 1 gas). Development drilling resulted in significant extensions of fields in Union, Lafayette,

**Natural Gas.**—Production of natural gas continued an upward trend for the fourth consecutive year, increasing 36 percent over 1959 output. North-Arkansas gasfields again accounted for more than half of the gas produced. Gas output in south Arkansas gained 44 percent compared with 1959. Proved natural gas reserves at yearend had increased in both sections of the State. Fifteen counties reported natural gas production. The leaders, in order of production value, were Franklin, Columbia, Lafayette, Pope, and Miller Counties.

**Natural Gas Liquids.**—Overall quantity and value of natural gas liquids gained 12 and 6 percent, respectively, over 1959. A decrease in total value of natural gasoline and cycle products was more than offset by an increase in the value of liquid petroleum gas production. Four natural-gasoline plants and two cycling plants operated throughout the year. A fifth natural-gasoline plant, operated by Shell Oil Co. at Magnolia, discontinued production in mid-1960.

**TABLE 5.—Estimated proved recoverable reserves of crude oil, natural gas liquids, and natural gas**

| | Proved reserves Dec. 1, 1959 | Changes in proved reserves, due to extensions and new discoveries in 1960 | Proved reserves, Dec. 31, 1960 (production was deducted) | Change from 1959, percent |
|---|---|---|---|---|
| Crude oil.....thousand barrels.. | 312,911 | 15,236 | 301,997 | −3 |
| Natural gas liquids [1].....do.... | 32,017 | 2,625 | 27,497 | −14 |
| Natural gas.....million cubic feet.. | 1,422,817 | 119,475 | 1,459,710 | +3 |

Petroleum.—Crude petroleum continued to be the State's most important mineral commodity. Estimated production was 29 million barrels valued at $80.2 million, increases of 10 percent in both quantity and value above production in 1959.

Digitized by Google

## NONMETALS

**Abrasive Stone.**—Novaculite, quarried in Garland County, was processed into grinding pebbles and oilstones. Production decreased 15 percent in quantity and 13 percent in value compared with 1959.

**Barite.**—Arkansas barite sold or used by producers was 18 percent less than that reported in 1959. The decline was attributed to a significant decrease in oil well drilling. Nearly all the barite was processed for use in drilling muds.

U.S. Glass and Chemical Corp. continued construction of a $700,000 barite and gravel plant at Dierks. Additional flotation circuits, added to the original mill design, increased the capacity to about 42,000 tons of finished barite per year. Completion of the plant was scheduled for June 1961.

**TABLE 10.—Primary barite sold or used by producers**

| Year | Short tons | Value (thousands) | Year | Short tons | Value (thousands) |
|---|---|---|---|---|---|
| 1951-55 (average) | 409,995 | $3,784 | 1958 | 182,779 | $1,668 |
| 1956 | 486,254 | 4,256 | 1959 | 338,539 | 3,097 |
| 1957 | 477,327 | 4,537 | 1960 | 277,851 | 2,578 |

**Bromine.**—Michigan Chemical Corp. recovered bromine from oil well brines pumped to its El Dorado plant. Expansion during 1960 brought the capacity of the plant to 10 million pounds of elemental bromine a year.

Arkansas Chemicals, Inc., announced plans to build a $1.5 million bromine-recovery plant near El Dorado. Completion was scheduled for mid-1961. Well brines from nearby fields were to be processed.

**Cement.**—Total output of portland and masonry cements at the State's two plants gained substantially compared with 1959. Cement shipments were up significantly in quantity and value. Increased residential and nonresidential construction during the year contributed to the gains.

**Clays.**—An overall gain of 4 percent was reported for clay sold and used. Major uses were unchanged. Fire clay gained 7 percent, and miscellaneous clay, including that used in manufacture of cement, increased only 1 percent.

Acme Brick Co. completed expansion of facilities at its Malvern plant. New installations included clay storage, screening, and blending equipment, a modern vacuum pug mill and brick machine, a tunnel kiln with attached dryer, and a structure to house the kiln.

**Gem Stones.**—Quartz crystals and specimen grade samples of various minerals contributed the major part of the reported value of Arkansas gem stones. The Crater of Diamonds at Murfreesboro accounted for almost half the value of the 1960 production.

**Gypsum.**—Output of gypsum, all from Pike County, increased 15 percent over 1959. All Arkansas gypsum was utilized in the manufacture of cement. Dulin Bauxite Co., operator of the gypsum mine and mill near Murphreesboro, rebuilt the plant to allow better quality control of the calcined product.

Digitized by Google

**Maricopa.**—Mainly because of a substantial drop in the shipment of manganese ore and concentrates (35 percent or more Mn) and an equally significant gain in the consumption of sand and gravel, the contribution of nonmetallic production to the total value of all minerals produced rose to 98 percent compared with 81 percent in 1959. Maricopa County was the leading producer of sand and gravel in the State with output reaching nearly 6 million tons, a 27-percent increase over 1959. Fourteen commercial operations produced 4.7 million tons, and Government-and-contractor operations produced the remainder. Union Rock & Materials Co. and Superior Sand & Gravel Division, Fisher Contracting Co., were the principal commercial producers. Wallapai Brick & Clay Products, Inc., and Phoenix Brick Yard operated brick and heavy clay products plants using miscellaneous clay and shale mined within the county. The grinding mill of Buckeye Mica Co. operated on an accelerated basis during the year, and sales were considerably higher than in 1959.

The decline in manganese ore and concentrate production (shipments) resulted from the completion of the Government carlot-purchase program in 1959. The small quantities of manganese concentrate shipped in 1960 were recovered by treating manganese mill tailings. Some manganiferous ore was shipped from the Black Rock mine to the Kaiser Steel Corp., Fontana, Calif., by Mohave Mining and Milling Co. Mercury was produced from the Turn Bull mine by Bacon, Grimes & Brunson and from the Oneida mine by the Oneida Mining Co. Small quantities of gold, silver, and copper came from six lode mines and one placer mine.

**Mohave.**—Sand and gravel, stone, feldspar, and gem stones accounted for three-fourths of the total value of the county's mineral production. IMC continued to mine and mill feldspar at its Kingman mill. This mill also ground quartzite which accounted for the bulk of the stone production.

Five mines accounted for the small output of gold, silver, copper, lead, and zinc. The Antlers and McCracken mines were the principal producers.

**Navajo.**—Uranium ore accounted for three-quarters of the total value of mineral production and the county ranked third in the output of this mineral commodity. The major producer was Industrial Uranium Co., operating the Big Chief, Moonlight, Starlight No. 1, and Sunlight mines. A portion of the uranium ore mined contained sufficient vanadium oxide to warrant recovery. Ores containing vanadium were shipped to southwestern Colorado mills where the vanadium was recovered and the value credited to Arizona. Other uranium ores contained significant quantities of copper, which was recovered at the Mexican Hat, Utah, plant of Texas Zinc Minerals Corp.

Two exploratory oil wells were drilled. Both were dry and were abandoned. The Hopi Indian Agency operated the Keams Canyon No. 4 coal mine.

**Pima.**—Copper furnished 84 percent of the value of mineral production. Five mines, New Cornelia (3d largest copper producer in the State), Esperanza (7th), Silver Bell (8th), Pima (11th), and Daisy (19th), supplied 99.7 percent of the county's and 24 percent of the State's copper output. Most of the gold and silver were recovered as

Digitized by Google

byproducts of copper ore. All of the molybdenum produced came from copper ore treated at the Esperanza and Silver Bell operations.

In its annual report, Phelps Dodge Corp. reported that 23,721,000 tons of material was handled from the Ajo open-pit mine by the New Cornelia Branch operation; 9,066,000 tons was ore and 14,655,000 tons was waste material. From the ore milled, 66,693 tons of copper was produced.

Duval Sulphur & Potash Co. completed the first full year of operation at its Esperanza copper property. Production was maintained at the maximum level throughout the year, and the average milling rate was 11,600 tons of ore per day. The marketed products were copper concentrate and molybdic trioxide.

At the Silver Bell mine, the Silver Bell Unit of Asarco continued to mine copper ore from the Oxide and El Tiro open-pit mines. A substantial quantity of exploration and development diamond drilling was conducted.

Cyprus Mines Corp., which owned 50 percent of the Pima Mining Co., stated in its annual report that 1,327,473 tons of ore containing 1.14 percent copper was produced from the Pima mine and was concentrated at the company mill in 1960. Mill alterations to increase the capacity from 3,000 to 3,800 tons per day were completed. An agreement was reached with Banner Mining Co. under which Pima would mine and mill an estimated 1.8 million tons of Banner's ore. Stripping was ahead of schedule at the close of the year. Mining of Banner's ore by Pima was to begin in 1962. Banner decided to stop production from the Daisy underground mine because of the proximity of the Pima open-pit operation.

The Banner Mining Co. Palo Verde shaft was completed to its final depth of 960 feet by October. The company started cutting stations and ore and waste pockets on the 700, 800, and 900 levels. By yearend, 100 tons of ore per day was being mined from development work on the Palo Verde mine.

The Atlas mine, operated by B. S. & K. Mining Co., was the principal producer of zinc in the county.

Cement was the second-ranking commodity in terms of value, and shipments of portland and masonry cement from the Rillito plant of Arizona Portland Cement Co. were 15 percent greater than in 1959. Except for a small quantity of limestone used for roofing granules, all of the limestone quarried in 1960 was used in manufacturing cement. Crushed marble, used as roofing granules, and crushed sandstone, used as riprap and smelter flux, were also quarried. Devry Brick Co., Inc., Grabe Brick Co., and Tucson Pressed Brick Co. produced miscellaneous clay and shale for use at their respective plants in manufacturing brick and other heavy clay products. Tucson Perlite Co. did not mine any crude perlite in 1960, and its Tucson expanding plant operated on crude material mined in 1959.

**Pinal.**—Copper supplied $100 million (94 percent) of the $106.7 million value of mineral production. Output from three mines, San Manuel (second-largest copper producer in the State), Ray (fifth), and Magma (ninth) accounted for 99.8 percent of the county's and 29 percent of the State's copper production. Most of the gold and silver from the county was recovered as a byproduct of copper.

615629—61——9

Digitized by Google

All of the molybdenum was recovered as a byproduct of copper ore milling at San Manuel.

Magma Copper Co., sole owner of the San Manuel Copper Corp., announced in its annual report that 12,261,220 tons of ore with 0.71-percent copper in the sulfide minerals was mined from San Manuel in 1960. The copper contained in the oxide minerals in the ore was not recovered. Tons of ore mined per operating day averaged 34,249 for the year, compared with 32,741 in 1959 and 32,175 in 1958. Metal recovered from the ore milled included 81,724 tons of copper, 2.8 million pounds of molybdenum sulfide, 18,010 ounces of gold, and 290,617 ounces of silver. A cyanide plant for the recovery of gold from the molybdenum sulfide concentrate was completed and placed in operation in July. During the year, 296,804 tons of copper concentrate was processed at the smelter, an average of 847 tons per day of operation, and anode copper was produced.

According to the Kennecott Copper Corp. annual report, 6.5 million tons of ore was mined by the Ray Mines Division in 1960, compared with 3.0 million tons in 1959. Copper production from all Ray operations, mining and milling of ore and leaching of waste dumps and ore in place, was 58,799 tons of copper, compared with 29,084 tons in 1959. Expansion of productive capacity at the Ray Division was completed by the middle of the year. The $35 million program included enlargement of the pit, which necessitated the relocation of certain surface facilities to permit the mining of additional ore reserves; and increased mine equipment and mill capacity to make possible the mining and milling of 22,500 tons of ore a day compared with 15,000 tons formerly. The expansion enabled Ray Mines to produce 20,000 additional tons of copper a year, an increase of 40 percent.

Magma Copper Co., according to its annual report, produced 386,636 tons of ore assaying 5.10 percent copper, 0.04 ounces gold, and 1.73 ounces silver in 1960, compared with 276,387 tons assaying 5.23 percent copper, 0.04 ounces gold, and 1.50 ounces silver in 1959. In addition, 440 tons of custom ore was purchased and treated, compared with 106 tons in 1959. Mine production was resumed on January 19 after the strike settlement, and smelter operation was resumed on February 11 after repairs interrupted by the strike had been completed. Development work at the Magma mine during the year comprised 11,789 feet of drifts and crosscuts, 5,849 feet of raises, and 5,995 feet of diamond drilling.

All of the molybdenum and most of the gold and silver output in the county were recovered as byproducts from copper ore. Molybdenum, gold, and silver accounted for 4 percent of the county's value of mineral production.

Although nonmetals contributed only 2 percent of the total value of all mineral production, a number of the commodities in this group were necessary for the production of the more valuable metals. Some of the pyrite recovered from base-metal milling was roasted to produce sulfuric acid for copper leaching and sponge iron for precipitation. Lime produced by San Manuel Copper Corp. was used in its San Manuel concentrator, and quartzite quarried by the same company was used as flux in the treatment of copper ores. A portion of the

Digitized by Google

gypsum mined by Arizona Gypsum Co., Garcia & Peters, and National Gypsum was shipped to wallboard and cement plants but returned to the county as cement, wallboard, and other building products consumed by the mineral industry; some of the gypsum was used locally for agricultural purposes. Miscellaneous clay or shale mined by Phoenix Brick Yard was used in the manufacture of building brick and other clay products, and the crude perlite mined by Arizona Perlite Roofs, Inc., and Harborlite Corp. was expanded at Tucson and California expanding plants for use in building plaster and other construction applications. Four commercial and two Government-and-contractor producers mined 1.3 million tons of sand and gravel valued at $1.1 million. This material was used for building and paving construction, mostly in Pinal County. San Manuel Copper Corp. mined all of the crushed limestone and sandstone for use as smelter flux and in the manufacture of lime at its San Manuel Copper operation. A small quantity of crushed marble was quarried and used as roofing granules.

**Santa Cruz.**—Production of gold, silver, copper, lead, and zinc came from ore from three mines and cleanup at two mines. The Flux mine operated by Nash & McFarland was the principal producer. An average of 2,500 tons of ore per month from the Flux mine was treated in the Trench mill; in addition some custom ore was milled. In mid-year a crew of 38 men was employed: 29 in the mine and 7 in the mill, working 2 shifts per day, 6 days per week; and 2 in the shops, working 1 shift.

**Yavapai.**—Gold, silver, copper, lead, and zinc accounted for 79 percent of the value of mineral production. The Iron King mine at Humbolt, operated by the Iron King Branch of Shattuck Denn Mining Corp., was the State's leading silver, lead, and zinc producer and the third largest gold producer. According to the company report, operations continued throughout the year without interruption, and 304,735 tons of ore was mined.

The Bagdad Copper Corp. mine at Bagdad continued to be the principal producer of copper in the county and was the 12th largest producer in the State. Byproduct gold, silver, and molybdenum also were recovered. Production of copper nearly equaled that of 1959. Construction of a plant to produce copper by leaching stockpiled oxidized copper material was on schedule at the close of the year. The section to produce sulfuric acid from sulfur was completed and tested. The launders where copper is precipitated from copper solutions on detinned cans were completed. The final item, the piping and irrigation system to circulate the acid solution over the dumps, was nearly completed. The plant was expected to add 20 tons per day to the copper output of the operation.

The Old Dick mine, wholly owned and operated by Cyprus Mines Corp., was one of the county's leading copper (14th in the State) and zinc (2d in the State) producers. The company reported that 80,940 tons of ore, including a small tonnage of development ore from the adjacent Copper Queen mine, was mined and milled in 1960, compared with 76,111 tons in 1959. Plans were announced to increase the processing capacity of the property from 240 to 300 tons per day by

Digitized by Google

installing a heavy-medium separation plant to remove barren and low-grade material from the ore before grinding.

Other important metal producers in the county included Big Hole Mining Co., which produced copper ore from the United Verde open-pit mine (formerly operated by Phelps Dodge Corp.), and Fred D. Schemmer, who operated the Commercial mine under lease from Phelps Dodge Corp. and produced fluxing copper ore for the Phelps Dodge smelter at Douglas. Earl Anderson recovered a small quantity of hand-cobbed beryl concentrate from the Homestead Lode.

The first full year's operation of the Phoenix Cement Co. plant at Clarkdale resulted in a substantial increase in the value of cement sold in the county; cement ranked third in terms of value. Phoenix Cement Co. also operated the Redwall and Lakebed quarries to supply cement rock to its Clarkdale plant. Arizona Gypsum Co. mined gypsum from the Camp Verde deposit for use in manufacturing cement. The Flintkote Co. reduced the output of lime from its Nelson plant 12 percent. Scoria was added to the list of nonmetals produced in the county and was produced by Yavapai Block Co. from its Cruice cinder pit near Ashfork.

**Yuma.**—The county highway department and contractors for the State highway department and the Federal Bureaus of Public Roads and Reclamation produced 594,600 tons of structural and paving sand and gravel. Buckeye Mica Co. mined sericite mica from its property near Quartzite.

Gold, silver, and copper were recovered from small lots of ore produced from seven lode mines; silver, lead, and zinc were recovered from tailings and cleanup material from two operations; and copper was recovered from copper precipitates at one operation.

# The Mineral Industry of Arkansas

**This chapter has been prepared under a cooperative agreement for the collection of mineral data between the Bureau of Mines, U.S. Department of the Interior, and the Arkansas Geological and Conservation Commission, Norman F. Williams, Director and State Geologist, Little Rock, Ark.**

By Harry F. Robertson [1] and Raymond B. Stroud [2]

VALUE of mineral production in Arkansas in 1960 increased 9 percent over 1959. The record value of $155 million reflects the continued growth of the mineral industry and represents a 16 percent increase since 1955. In 1960, gains were reported in the value of bauxite, clays, gem stones, natural gas, natural gas liquids, crude petroleum, and stone; decreases were noted in the value of barite, coal, and sand and gravel. Emphasis continued on development of new industries.

Construction began on Beaver Dam, the fourth major project in the upper White River basin for control and development of the river and its tributaries. The dam will be located 8 miles west of Eureka Springs and will consist of a concrete barrier 1,333 feet long and 228 feet above the stream bed, supplemented by all-earth structures where needed on the reservoir rim. In addition to flood control and hydroelectric power, the dam will create a reservoir extending upstream to the vicinity of Fayetteville. Construction of the dam, embankment, and dikes will require an estimated 539,000 cubic yards of excavation, 1,327,000 cubic yards of fill, 754,000 cubic yards of concrete, and 1,400 tons of reinforcing steel. Aggregate for the concrete will be obtained from a limestone quarry near the damsite.

Dardanelle Lock and Dam project continued on schedule during the year and, at yearend, was 12 percent complete. Future work includes relocation of cemeteries, powerlines, gaslines, and highways, and procurement and installation of four turbines and four generators.

Greers Ferry Dam, a multiple-purpose project on the Little Red River near Heber Springs, was 41 percent complete. Construction of the powerhouse was scheduled to start about mid-1961 and will complete the $56 million project.

Other new and expanded markets for the State's mineral resources resulted from construction projects such as the $10 million plant of Norge Division of Borg-Warner Corp. at Fort Smith, the Crane Co. $6.5 million installation at Jonesboro, and the Seiberling Rubber Corp.

plant at Batesville. Two major projects at Helena—the Mississippi River bridge and the Arkansas Power and Light Co. generating plant—were completed during the year.

**Employment and Injuries.**—Employment in all categories of the mining industry dropped sharply and was 10 percent lower than that reported in 1959. The mining industry annual payroll decreased 9.5 percent; however, the overall average of weekly wage rates increased 1 percent. Average weekly wages were: $115.92 in the metal mining industry, a gain of 8 percent over 1959; $93.35 in the coal industry, a gain of 3 percent; $91.59 in the crude petroleum and natural gas industry, essentially unchanged; and $76.31 in the nonmetal mining and quarrying industries, a decrease of 1 percent.

**TABLE 2.—Average annual employment for selected minerals**

| Industry | 1959 | | 1960 | |
|---|---|---|---|---|
| | Employing units | Employment | Employing units | Employment |

# REVIEW BY MINERAL COMMODITIES

## MINERAL FUELS

**Coal.**—The number of bituminous coal mines operated during the year was unchanged from 1959—10 underground and 10 strip-mines. Output from underground mines accounted for 27 percent; that from open-pit mines for 73 percent of the total production of 409,199 short tons of coal. Total production decreased 7 percent in quantity and 10 in value, compared with 1959, because of a significant decrease in output from underground mines.

**TABLE 3.—Coal production**

(Thousand short tons and thousand dollars)

| Year | Short tons | Value | Year | Short tons | Value |
|---|---|---|---|---|---|
| 1951-55 (average) | 762 | $5,916 | 1958 | 364 | $2,744 |
| 1956 | 590 | 4,601 | 1959 | 441 | 3,482 |
| 1957 | 508 | 3,976 | 1960 | 409 | 3,116 |

At the 10 strip mines, 6 million cubic yards of overburden was excavated and 296,425 tons of coal loaded—a stripping ratio of 20 cubic yards of overburden to 1 ton of coal mined.

**Oil and Gas Exploration and Development.**—Drilling activity in 86 fields in 21 counties resulted in completion of 285 oil wells, 39 gas wells, and 257 dry holes. The total number of holes drilled decreased 23 percent. The reduced drilling activity was attributed mainly to loss of part of the State's crude oil market. Significant decreases in development drilling were noted in Union, Ouachita, Nevada, and Columbia Counties.

During 1960, 56 percent of the wells drilled were completed as producers of oil or gas; 35 wells were successfully completed as new sources of supply, establishing 8 new fields (3 oil and 5 gas) and 27 new pools (19 oil and 8 gas). Successful outpost wells established significant lateral extensions of at least 15 fields during the year.

The deepest well drilled in 1960 was in Lafayette County and was completed as a producer in the Smackover formation at a total depth of 11,509 feet. The record producing depth, about 11,015 feet, was established in 1960 in the newly discovered Lake Erling oilfield in Lafayette County.

In north Arkansas, dry natural gas was produced from relatively shallow sands of Pennsylvanian, Mississippian, and Devonian ages. Drilling activity in this part of the State resulted in discovery of four new gasfields and five new sources of gas supply. At yearend, there were 50 gasfields in the north Arkansas area.

In south Arkansas, oil and gas production came from Cretaceous and Jurassic formations. Exploratory and development drilling, conducted in 10 counties and 63 fields, totaled 528 wells. Of the wells drilled, 127 were wildcat and resulted in the discovery of 4 new fields (3 oil and 1 gas) and 20 new pools (19 oil and 1 gas). Development drilling resulted in significant extensions of fields in Union, Lafayette,

and Miller Counties. Of 173 fields found to date, 146 remained active producers of oil, condensate, or gas. Almost all the fields in southern Arkansas produced from multiple sources.

Pressure maintenance and secondary recovery projects were carried out in several southern Arkansas fields during 1960. Post-initiation [illegible] of gas injection successfully prolonged the productive life of fields in Columbia, Lafayette, Ouachita, Miller, and Union Counties.

Pipeline Construction.—Arkansas Public Service Commission approved construction of new natural gas lines by Arkansas Western Gas Co. The natural gas is to be transmission lines from Coal [illegible], Ark., and Red River gas fields and additional compressor [illegible]. Arkansas-Louisiana Gas Co. completed a 120-mile, 16-inch pipeline from the Carthage, Texas, area. The new line terminated at the Arkansas Power and Light Co. generating plant that used [illegible].

Digitized by Google

**Natural Gas.**—Production of natural gas continued an upward trend for the fourth consecutive year, increasing 36 percent over 1959 output. North-Arkansas gasfields again accounted for more than half of the gas produced. Gas output in south Arkansas gained 44 percent compared with 1959. Proved natural gas reserves at yearend had increased in both sections of the State. Fifteen counties reported natural gas production. The leaders, in order of production value, were Franklin, Columbia, Lafayette, Pope, and Miller Counties.

**Natural Gas Liquids.**—Overall quantity and value of natural gas liquids gained 12 and 6 percent, respectively, over 1959. A decrease in total value of natural gasoline and cycle products was more than offset by an increase in the value of liquid petroleum gas production. Four natural-gasoline plants and two cycling plants operated throughout the year. A fifth natural-gasoline plant, operated by Shell Oil Co. at Magnolia, discontinued production in mid-1960.

**TABLE 5.—Estimated proved recoverable reserves of crude oil, natural gas liquids, and natural gas**

| | Proved reserves Dec. 1, 1959 | Changes in proved reserves, due to extensions and new discoveries in 1960 | Proved reserves, Dec. 31, 1960 (production was deducted) | Change from 1959, percent |
|---|---|---|---|---|
| Crude oil.....thousand barrels.. | 312,911 | 15,236 | 301,997 | −3 |
| Natural gas liquids [1].....do.... | 32,017 | 2,625 | 27,497 | −14 |
| Natural gas.....million cubic feet.. | 1,422,817 | 119,475 | 1,459,710 | +3 |

| July | 2,443 | 2,604 | 1,743 | Total | 28,953 | 29,202 | |

Petroleum.—Crude petroleum continued to be the State's most important mineral commodity. Estimated production was 29 million barrels valued at $80.2 million, increases of 10 percent in both quantity and value above production in 1959.

Digitized by Google

## NONMETALS

**Abrasive Stone.**—Novaculite, quarried in Garland County, was processed into grinding pebbles and oilstones. Production decreased 15 percent in quantity and 13 percent in value compared with 1959.

**Barite.**—Arkansas barite sold or used by producers was 18 percent less than that reported in 1959. The decline was attributed to a significant decrease in oil well drilling. Nearly all the barite was processed for use in drilling muds.

U.S. Glass and Chemical Corp. continued construction of a $700,000 barite and gravel plant at Dierks. Additional flotation circuits, added to the original mill design, increased the capacity to about 42,000 tons of finished barite per year. Completion of the plant was scheduled for June 1961.

**TABLE 10.—Primary barite sold or used by producers**

| Year | Short tons | Value (thousands) | Year | Short tons | Value (thousands) |
|---|---|---|---|---|---|
| 1951-55 (average) | 409,995 | $3,784 | 1958 | 182,779 | $1,668 |
| 1956 | 486,254 | 4,256 | 1959 | 338,539 | 3,097 |
| 1957 | 477,327 | 4,537 | 1960 | 277,851 | 2,578 |

**Bromine.**—Michigan Chemical Corp. recovered bromine from oil well brines pumped to its El Dorado plant. Expansion during 1960 brought the capacity of the plant to 10 million pounds of elemental bromine a year.

Arkansas Chemicals, Inc., announced plans to build a $1.5 million bromine-recovery plant near El Dorado. Completion was scheduled for mid-1961. Well brines from nearby fields were to be processed.

**Cement.**—Total output of portland and masonry cements at the State's two plants gained substantially compared with 1959. Cement shipments were up significantly in quantity and value. Increased residential and nonresidential construction during the year contributed to the gains.

**Clays.**—An overall gain of 4 percent was reported for clay sold and used. Major uses were unchanged. Fire clay gained 7 percent, and miscellaneous clay, including that used in manufacture of cement, increased only 1 percent.

Acme Brick Co. completed expansion of facilities at its Malvern plant. New installations included clay storage, screening, and blending equipment, a modern vacuum pug mill and brick machine, a tunnel kiln with attached dryer, and a structure to house the kiln.

**Gem Stones.**—Quartz crystals and specimen grade samples of various minerals contributed the major part of the reported value of Arkansas gem stones. The Crater of Diamonds at Murfreesboro accounted for almost half the value of the 1960 production.

**Gypsum.**—Output of gypsum, all from Pike County, increased 15 percent over 1959. All Arkansas gypsum was utilized in the manufacture of cement. Dulin Bauxite Co., operator of the gypsum mine and mill near Murphreesboro, rebuilt the plant to allow better quality control of the calcined product.

| Year | Arkansas (thousand barrels) | Change, percent | |
|---|---|---|---|
| | | In Arkansas | In United States |
| 1951–55 (average) | 1,997 | | |
| 1956 | 1,843 | −27 | +6 |
| 1957 | 1,694 | −8 | −6 |
| 1958 | 2,129 | +26 | +6 |
| 1959 | 2,624 | +23 | +9 |
| 1960 | 2,590 | −1 | −7 |

**TABLE 12.—Clays sold or used by producers, by kinds**

(Thousand short tons and thousand dollars)

| Year | Miscellaneous clay [1] | | Fire clay | | Total clay | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 201 | $283 | 385 | $1,594 | 586 | $1,877 |
| 1956 | 444 | 447 | 275 | 1,189 | 719 | 1,636 |
| 1957 | 226 | 226 | 390 | 1,360 | 616 | 1,586 |
| 1958 | 265 | 264 | 313 | 1,313 | 578 | 1,577 |
| 1959 | 383 | 383 | 399 | 2,023 | 782 | 2,406 |
| 1960 | 388 | 387 | 427 | 2,069 | 815 | 2,456 |

[1] Includes clay used for cement.

**Lime.**—Production of lime increased 9 percent over 1959. The aluminum industry was the major consumer; lesser amounts were used for water purification and by the paper, petroleum, sugar-refining, and other industries.

**Sand and Gravel.**—Sand and gravel was produced in 39 of the 75 counties. Production was off 30 percent, and value decreased 13 percent compared with 1959. The decrease in output was attributed to completion of the Freeway Bridge at Little Rock—about 4 million tons of sand and gravel was used in the project in 1959 and none in 1960.

**Stone.**—A record value of $13.6 million from production of 10.9 million short tons of stone (including slate) reflected continued growth of the Arkansas stone industry for the ninth consecutive year. Significant gains were reported in production of crushed granite, dimension marble, and crushed sandstone.

**Sulfur (Recovered Elemental).**—Recovery of byproduct sulfur, from gas cycle plants in Columbia, Lafayette, and Union Counties, increased 36 percent compared with 1959. Four sulfur-recovery units were in operation at yearend.

The initial run from the new sulfur-recovery unit at the El Dorado refinery of Lion Oil Co. was shipped in September. The product from the unit, which has a capacity of 15 tons daily, was used at the nearby Monsanto Chemical Co. plant.

Arkansas-Louisiana Chemical Corp. placed a sulfur-recovery unit in operation at the Hamilton plant at midyear and the plant was altered to handle gas from the Magnolia field.

| Total sand and gravel | 4,723 | 4,322 | 2,257 | 3,530 |
| Grand total | 11,696 | 11,857 | 8,192 | 10,262 |

[1] Includes glass, molding, filtering, and other construction, industrial, and ground sands; railroad ballast and miscellaneous gravels, which the Bureau of Mines is not at liberty to publish separately.

**TABLE 14.—Stone sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1956 | 6,325 | $8,113 | 1959 | 8,824 | $10,424 |
| 1957 | 7,336 | 8,871 | 1960 | 10,939 | 13,555 |
| 1958 | 8,461 | 10,178 | | | |

## METALS

**Aluminum.**—Production of primary aluminum declined sharply in 1960, reflecting the lack of demand for the product. In January, Reynolds Metals Co. cut production of the Arkadelphia plant to 25 percent of capacity.

**Bauxite.**—Production of crude bauxite increased 18 percent over 1959 output and accounted for 97 percent of all U.S. production. About 88 percent of the bauxite was mined in Saline County and 12 percent in Pulaski County compared with 98 percent in Saline County and 2 percent in Pulaski County in 1959. The outstanding production gain in Pulaski County came mainly from the Berry-Mayhan, Heckler, and Bierman Tract open-pit mines.

Reynolds Mining Corp., with open-pit and underground mines in Saline and Pulaski Counties, was the leading bauxite producer. Aluminum Company of America, with strip mining in Saline County, ranked second.

**Manganese.**—Manganese production terminated in August 1959, the closing date of the Government manganese-purchasing program. Mining economics prevented the Arkansas manganese producers from competing for the remaining markets.

**TABLE 15.—Bauxite mine production and shipments from mines and processing plants to consumers**

(Thousand long tons and thousand dollars)

| Year | Mine production | | | Shipments | | |
|---|---|---|---|---|---|---|
| | Crude | Dry equivalent | Value | As shipped | Dry equivalent | Value |
| 1951–55 (average) | 2,041 | 1,724 | $13,098 | 1,891 | 1,681 | $14,241 |
| 1956 | 1,966 | 1,659 | 14,444 | 1,817 | 1,567 | 14,643 |
| 1957 | 1,625 | 1,357 | 12,314 | 2,004 | 1,696 | 16,476 |
| 1958 | 1,516 | 1,258 | [1] 12,311 | 1,586 | 1,341 | [1] 14,373 |
| 1959 | 1,940 | 1,632 | 17,048 | 1,827 | 1,580 | 17,960 |
| 1960 | 2,327 | 1,932 | 20,469 | 1,876 | 1,604 | 18,982 |

[1] Revised figure.

**TABLE 16.—Manganese ore shipped from mines [1]**

| Year | Short tons | | Value (thousands) |
|---|---|---|---|
| | Gross weight | Mn content | |
| 1951–55 (average) | 9,912 | 4,471 | (2) |
| 1956 | 29,485 | 12,525 | $2,056 |
| 1957 | 23,261 | 10,000 | 1,726 |
| 1958 | 22,221 | 9,440 | 1,737 |
| 1959 | 17,742 | 6,714 | 1,398 |
| 1960 [3] | | | |

[1] Containing 35 percent or more manganese (natural).
[2] Data not available.
[3] No production in 1960.

The Federal Bureau of Mines continued sampling, mapping, and correlation of manganese and manganiferous limestone deposits in Arkansas.

**Zinc.**—Rush Creek Mining Co. produced and milled zinc ore at the Monte Cristo mine near Yellville, Marion County, and shipped a small quantity of concentrate to the La Salle Smelter of Matthiessen & Hegeler Zinc Co. at La Salle, Ill. A company-owned churn drill was used in a limited exploration program during the year.

## REVIEW BY COUNTIES

Mineral production was reported in 56 of the 75 counties; 11 counties reported production valued at more than $3 million. Five counties—Columbia, Union, Saline, Lafayette, and Ouachita—contributed 65 percent of the total mineral-production value.

**Ashley.**—Washed sand and gravel for building and road construction was produced by St. Francis Material Co.

**Benton.**—White River Sand & Gravel Co. produced building and paving sand and gravel; Paul Davis mined pit-run gravel for fill. Independent Gravel Co. quarried and crushed limestone for soil conditioning, mineral food, glass, asphalt filler, and other purposes.

**Bradley.**—An outstanding increase in the value of mineral production resulted from large gains in output of petroleum and sand and

| Undistributed | 13,755,426 | 20,285,850 | |
| Total | 140,594,000 | 155,039,000 | |

[1] The following counties are not listed because no mineral production was reported: Arkansas, Cleveland, Crittenden, Dallas, Desha, Lee, Monroe, Newton, Prairie, Randolph, Scott, Searcy, Sevier, Sharp, Van Buren, Woodruff, and Yell.
[2] Figure withheld to avoid disclosing individual confidential data; included with "Undistributed."

gravel. Moro Gravel Co. and Carter Lyon supplied the sand and gravel.

Development-well drilling in the Lick Creek field was extremely successful inasmuch as all wells produced oil. Exploratory drilling

Digitized by Google

by Olin Oil and Gas Corp. resulted in discovery of one new oilfield, Careyville Landing, on the southwestern edge of the county.

**Calhoun.**—Washed sand and gravel for construction and paving accounted for about half the total value of mineral production. Contributing to total production were Reynolds and Williams, St. Francis Material Co., Pine Bluff Sand and Gravel Co., Twin City Gravel Co., Ouachita Aggregate Co., and W. W. Grant. Development-well drilling added 15 new producers to existing oilfields, considerably increasing petroleum output.

**Carroll.**—Southeast Construction Co. and Garrett Gravel Co. produced construction and paving sand and gravel. U.S. Corps of Engineers used a substantial quantity of crushed limestone for road building.

**Chicot.**—Value of sand and gravel production for building and paving was more than double that reported in 1959. Producers were Greenville Gravel Co. and Linwood Smith Construction Co.

**Cleburne.**—U.S. Corps of Engineers contracted for 975,000 tons of crushed sandstone which was used as drainage blanket, riprap, and concrete aggregate in the Greers Ferry Dam project. A small amount of natural gas was produced from the Quitman field in the southwest corner of the county.

**Columbia.**—The value of mineral production increased substantially compared with 1959. The county again led in total value of minerals and the quantities of petroleum and natural gas liquid produced. It ranked second in natural gas production. Arkansas-Louisiana Chemical Corp. added a sulfur-recovery unit to its Hamilton gas-processing plant at Magnolia. Shell Oil Co. discontinued operating its gas-processing plant in July. Lion Oil Co., Division of Monsanto Chemical Corp., recovered sulfur from sour gas at its Magnolia plant until mid-year, then moved the operation to Union County. Development-well drilling in the Stephens oilfield added 14 new producers. Columbia County Highway Department mined bank-run gravel for road construction and maintenance. Commercial producers of building, paving, and fill gravel were Columbia Sand & Gravel Co., Jennie F. Lovell, and Lambert & Barr, Inc.

**Conway.**—An outstanding gain in natural gas production resulted from increased output of the Jerusalem and Old Hickory gasfields. Southeast Construction Co. produced building and paving sand and gravel.

**Craighead.**—Gains were reported in output of sand and gravel for construction and roadwork. Major producers were St. Francis Material Co., Southeast Construction Co., Ralph Cox Gravel Co., Hugh Findley, and R. D. Davenport. Wheeler Brick Co., Inc., mined red clay for use in making face brick at its plant near Jonesboro.

**Crawford.**—Arkhola Sand & Gravel Co. reported production of considerable quantities of sand and gravel and crushed sandstone. The materials were used for building, paving, and fill. Ben M. Hogan & Co. mined and crushed sandstone for concrete aggregate and road construction. Jim Brewer Service & Supply quarried and crushed limestone. Exploratory drilling resulted in discovery of one new gasfield, Hollis Lake; two additional producing zones were discovered by subsequent development drilling.

Digitized by Google

**Cross.**—Production of sand and gravel was of major importance to the economy of Cross County. Commercial producers were Humphries and Kail, McGeorge Contracting Co., and Cross County Gravel Co.

**Franklin.**—Increases in production of natural gas and coal were sufficient to rank the county first in natural gas production and third in coal production. Exploratory drilling resulted in discovery of the new Altus gasfield. Development-well drilling was markedly successful; 16 of 17 field wells drilled were gas producers. Athletic Mining and Smelting Co. reported a quadruple completion in the Aetna gasfield. Additional reserves were reported for Cecil, Aetna, Rock Creek, Ozark, White Oak, and Lone Elm gasfields. Increased coal production from the Quality Excelsior Coal Co. strip mine added considerably to total value of mineral production in the county.

**Garland.**—Crushed sandstone, produced by Ben M. Hogan & Co., accounted for a substantial increase in mineral production value. Norton Pike Co. purchased novaculite, mined near Hot Springs, for shipment to its plant in New Hampshire. Oilstones and grinding pebbles were made from novaculite by Arkansas Abrasives, Inc., Arkansas Oilstone Co., and Jackson Whetstone Co. Pit-run gravel for various purposes was produced by Smith Bros. Construction and Materials Co.

**Grant.**—Southwest Concrete Material Corp., near Poyen, used clay from a nearby pit as raw material in its lightweight-aggregate plant. Sand and gravel overlying the clay was processed and used mostly as aggregate in concrete pipe.

**Greene.**—Arkansas Gravel Co. and B&S Gravel Co. produced building and paving sand and gravel. Ted Cline mined pit-run gravel for fill.

**Hempstead.**—Miscellaneous clay for building brick and other heavy clay products was mined by Hope Brick Works. Exploratory drilling for oil was unsuccessful during the year. Seven crew-weeks of geophysical exploration were reported.

**Hot Springs.**—Crude barite, the county's most important mineral, was mined and ground by Baroid Division of National Lead Co. and Magnet Cove Barium Corp. Acme Brick Co. (Perla plant) and Malvern Brick & Tile Co. mined fire clay for refractories and heavy clay products. Acme Brick Co. (Malvern plant) used miscellaneous clay for building brick and tile. Coogan Gravel Co. and Harbison-Walker Refractories Co. mined and processed rock for use in silica refractories. Malvern Minerals Co. produced finely ground silica sand for use in a liquid grinding operation especially useful for finishing small, cast-metal parts. Freshour Bros. and Malvern Gravel Co. produced building and paving sand and gravel. The Jones Mill aluminum-reduction plant of Reynolds Metals Co. operated throughout the year.

**Howard.**—Ideal Cement Co. mined chalk, marl, sand, and limestone for cement manufacture at its plant near Okay.

**Independence.**—Total value of mineral production in 1960 decreased considerably due to cessation of the Government manganese program. Hydrated lime and quicklime for industrial, chemical, and building uses were produced by Batesville White Lime Co.; the company also quarried and crushed limestone for soil conditioner, metallurgical

Source: Arkansas Oil and Gas Statistical Bulletin, vol. 18, No. 12, December 1959 through vol. 21, No. 4, April 1961.
National Oil Scouts & Landmen's Associations, Oil- and Gas-Field Development in the United States: Vol. 31, 1960.

and Miller Counties. Of 173 fields found to date, 146 remained active producers of oil, condensate, or gas. Almost all the fields in southern Arkansas produced from multiple sources.

Pressure maintenance and secondary recovery projects were carried out in several southern Arkansas fields during 1960. Pool unitization followed by water or gas injection successfully prolonged the productive life of fields in Columbia, Lafayette, Ouachita, Miller, and Union Counties.

**Pipeline Construction.**—Arkansas Public Service Commission approved construction of new natural gaslines by Arkansas Western Gas Co. The planned facilities included transmission lines from Coal Hill, Altus, and Rock Creek gasfields and additional compressor facilities. Arkansas-Louisiana Gas Co. completed a 125-mile, 18-inch gas-transmission line from Perla to Helena. The new line terminated at the Arkansas Power and Light Co. generating plant, that used up to 75 million cubic feet daily.

Digitized by Google

**Natural Gas.**—Production of natural gas continued an upward trend for the fourth consecutive year, increasing 36 percent over 1959 output. North-Arkansas gasfields again accounted for more than half of the gas produced. Gas output in south Arkansas gained 44 percent compared with 1959. Proved natural gas reserves at yearend had increased in both sections of the State. Fifteen counties reported natural gas production. The leaders, in order of production value, were Franklin, Columbia, Lafayette, Pope, and Miller Counties.

**Natural Gas Liquids.**—Overall quantity and value of natural gas liquids gained 12 and 6 percent, respectively, over 1959. A decrease in total value of natural gasoline and cycle products was more than offset by an increase in the value of liquid petroleum gas production. Four natural-gasoline plants and two cycling plants operated throughout the year. A fifth natural-gasoline plant, operated by Shell Oil Co. at Magnolia, discontinued production in mid-1960.

**TABLE 5.—Estimated proved recoverable reserves of crude oil, natural gas liquids, and natural gas**

| | Proved reserves Dec. 1, 1959 | Changes in proved reserves, due to extensions and new discoveries in 1960 | Proved reserves, Dec. 31, 1960 (production was deducted) | Change from 1959, percent |

Petroleum.—Crude petroleum continued to be the State's most important mineral commodity. Estimated production was 29 million barrels valued at $80.2 million, increases of 10 percent in both quantity and value above production in 1959.

Digitized by Google

## NONMETALS

**Abrasive Stone.**—Novaculite, quarried in Garland County, was processed into grinding pebbles and oilstones. Production decreased 15 percent in quantity and 13 percent in value compared with 1959.

**Barite.**—Arkansas barite sold or used by producers was 18 percent less than that reported in 1959. The decline was attributed to a significant decrease in oil well drilling. Nearly all the barite was processed for use in drilling muds.

U.S. Glass and Chemical Corp. continued construction of a $700,000 barite and gravel plant at Dierks. Additional flotation circuits, added to the original mill design, increased the capacity to about 42,000 tons of finished barite per year. Completion of the plant was scheduled for June 1961.

**TABLE 10.—Primary barite sold or used by producers**

| Year | Short tons | Value (thousands) | Year | Short tons | Value (thousands) |
|---|---|---|---|---|---|
| 1951-55 (average) | 409,995 | $3,784 | 1958 | 182,779 | $1,668 |
| 1956 | 486,254 | 4,256 | 1959 | 338,539 | 3,097 |
| 1957 | 477,327 | 4,537 | 1960 | 277,851 | 2,578 |

**Bromine.**—Michigan Chemical Corp. recovered bromine from oil well brines pumped to its El Dorado plant. Expansion during 1960 brought the capacity of the plant to 10 million pounds of elemental bromine a year.

Arkansas Chemicals, Inc., announced plans to build a $1.5 million bromine-recovery plant near El Dorado. Completion was scheduled for mid-1961. Well brines from nearby fields were to be processed.

**Cement.**—Total output of portland and masonry cements at the State's two plants gained substantially compared with 1959. Cement shipments were up significantly in quantity and value. Increased residential and nonresidential construction during the year contributed to the gains.

**Clays.**—An overall gain of 4 percent was reported for clay sold and used. Major uses were unchanged. Fire clay gained 7 percent, and miscellaneous clay, including that used in manufacture of cement, increased only 1 percent.

Acme Brick Co. completed expansion of facilities at its Malvern plant. New installations included clay storage, screening, and blending equipment, a modern vacuum pug mill and brick machine, a tunnel kiln with attached dryer, and a structure to house the kiln.

**Gem Stones.**—Quartz crystals and specimen grade samples of various minerals contributed the major part of the reported value of Arkansas gem stones. The Crater of Diamonds at Murfreesboro accounted for almost half the value of the 1960 production.

**Gypsum.**—Output of gypsum, all from Pike County, increased 15 percent over 1959. All Arkansas gypsum was utilized in the manufacture of cement. Dulin Bauxite Co., operator of the gypsum mine and mill near Murphreesboro, rebuilt the plant to allow better quality control of the calcined product.

| 1959 | 383 | 383 | 399 | 2,023 | 782 | 2,406 |
| 1960 | 388 | 387 | 427 | 2,069 | 815 | 2,456 |

[1] Includes clay used for cement.

**Lime.**—Production of lime increased 9 percent over 1959. The aluminum industry was the major consumer; lesser amounts were used for water purification and by the paper, petroleum, sugar-refining, and other industries.

**Sand and Gravel.**—Sand and gravel was produced in 39 of the 75 counties. Production was off 30 percent, and value decreased 13 percent compared with 1959. The decrease in output was attributed to completion of the Freeway Bridge at Little Rock—about 4 million tons of sand and gravel was used in the project in 1959 and none in 1960.

**Stone.**—A record value of $13.6 million from production of 10.9 million short tons of stone (including slate) reflected continued growth of the Arkansas stone industry for the ninth consecutive year. Significant gains were reported in production of crushed granite, dimension marble, and crushed sandstone.

**Sulfur (Recovered Elemental).**—Recovery of byproduct sulfur, from gas cycle plants in Columbia, Lafayette, and Union Counties, increased 36 percent compared with 1959. Four sulfur-recovery units were in operation at yearend.

The initial run from the new sulfur-recovery unit at the El Dorado refinery of Lion Oil Co. was shipped in September. The product from the unit, which has a capacity of 15 tons daily, was used at the nearby Monsanto Chemical Co. plant.

Arkansas-Louisiana Chemical Corp. placed a sulfur-recovery unit in operation at the Hamilton plant at midyear and the plant was altered to handle gas from the Magnolia field.

## METALS

**Aluminum.**—Production of primary aluminum declined sharply in 1960, reflecting the lack of demand for the product. In January, Reynolds Metals Co. cut production of the Arkadelphia plant to 25 percent of capacity.

**Bauxite.**—Production of crude bauxite increased 18 percent over 1959 output and accounted for 97 percent of all U.S. production. About 88 percent of the bauxite was mined in Saline County and 12 percent in Pulaski County compared with 98 percent in Saline County and 2 percent in Pulaski County in 1959. The outstanding production gain in Pulaski County came mainly from the Berry-Mayhan, Heckler, and Bierman Tract open-pit mines.

Reynolds Mining Corp., with open-pit and underground mines in Saline and Pulaski Counties, was the leading bauxite producer. Aluminum Company of America, with strip mining in Saline County, ranked second.

**Manganese.**—Manganese production terminated in August 1959, the closing date of the Government manganese-purchasing program. Mining economics prevented the Arkansas manganese producers from competing for the remaining markets.

[1] Containing 35 percent or more manganese (natural).
[2] Data not available.
[3] No production in 1960.

The Federal Bureau of Mines continued sampling, mapping, and correlation of manganese and manganiferous limestone deposits in Arkansas.

**Zinc.**—Rush Creek Mining Co. produced and milled zinc ore at the Monte Cristo mine near Yellville, Marion County, and shipped a small quantity of concentrate to the La Salle Smelter of Matthiessen & Hegeler Zinc Co. at La Salle, Ill. A company-owned churn drill was used in a limited exploration program during the year.

## REVIEW BY COUNTIES

Mineral production was reported in 56 of the 75 counties; 11 counties reported production valued at more than $3 million. Five counties—Columbia, Union, Saline, Lafayette, and Ouachita—contributed 65 percent of the total mineral-production value.

**Ashley.**—Washed sand and gravel for building and road construction was produced by St. Francis Material Co.

**Benton.**—White River Sand & Gravel Co. produced building and paving sand and gravel; Paul Davis mined pit-run gravel for fill. Independent Gravel Co. quarried and crushed limestone for soil conditioning, mineral food, glass, asphalt filler, and other purposes.

**Bradley.**—An outstanding increase in the value of mineral production resulted from large gains in output of petroleum and sand and

| Total | 140,594,000 | 155,039,000 | |

[1] The following counties are not listed because no mineral production was reported: Arkansas, Cleveland, Crittenden, Dallas, Desha, Lee, Monroe, Newton, Prairie, Randolph, Scott, Searcy, Sevier, Sharp, Van Buren, Woodruff, and Yell.
[2] Figure withheld to avoid disclosing individual confidential data; included with "Undistributed."

gravel. Moro Gravel Co. and Carter Lyon supplied the sand and gravel.

Development-well drilling in the Lick Creek field was extremely successful inasmuch as all wells produced oil. Exploratory drilling

Digitized by Google

by Olin Oil and Gas Corp. resulted in discovery of one new oilfield, Careyville Landing, on the southwestern edge of the county.

**Calhoun.**—Washed sand and gravel for construction and paving accounted for about half the total value of mineral production. Contributing to total production were Reynolds and Williams, St. Francis Material Co., Pine Bluff Sand and Gravel Co., Twin City Gravel Co., Ouachita Aggregate Co., and W. W. Grant. Development-well drilling added 15 new producers to existing oilfields, considerably increasing petroleum output.

**Carroll.**—Southeast Construction Co. and Garrett Gravel Co. produced construction and paving sand and gravel. U.S. Corps of Engineers used a substantial quantity of crushed limestone for road building.

**Chicot.**—Value of sand and gravel production for building and paving was more than double that reported in 1959. Producers were Greenville Gravel Co. and Linwood Smith Construction Co.

**Cleburne.**—U.S. Corps of Engineers contracted for 975,000 tons of crushed sandstone which was used as drainage blanket, riprap, and concrete aggregate in the Greers Ferry Dam project. A small amount of natural gas was produced from the Quitman field in the southwest corner of the county.

**Columbia.**—The value of mineral production increased substantially compared with 1959. The county again led in total value of minerals and the quantities of petroleum and natural gas liquid produced. It ranked second in natural gas production. Arkansas-Louisiana Chemical Corp. added a sulfur-recovery unit to its Hamilton gas-processing plant at Magnolia. Shell Oil Co. discontinued operating its gas-processing plant in July. Lion Oil Co., Division of Monsanto Chemical Corp., recovered sulfur from sour gas at its Magnolia plant until mid-year, then moved the operation to Union County. Development-well drilling in the Stephens oilfield added 14 new producers. Columbia County Highway Department mined bank-run gravel for road construction and maintenance. Commercial producers of building, paving, and fill gravel were Columbia Sand & Gravel Co., Jennie F. Lovell, and Lambert & Barr, Inc.

**Conway.**—An outstanding gain in natural gas production resulted from increased output of the Jerusalem and Old Hickory gasfields. Southeast Construction Co. produced building and paving sand and gravel.

**Craighead.**—Gains were reported in output of sand and gravel for construction and roadwork. Major producers were St. Francis Material Co., Southeast Construction Co., Ralph Cox Gravel Co., Hugh Findley, and R. D. Davenport. Wheeler Brick Co., Inc., mined red clay for use in making face brick at its plant near Jonesboro.

**Crawford.**—Arkhola Sand & Gravel Co. reported production of considerable quantities of sand and gravel and crushed sandstone. The materials were used for building, paving, and fill. Ben M. Hogan & Co. mined and crushed sandstone for concrete aggregate and road construction. Jim Brewer Service & Supply quarried and crushed limestone. Exploratory drilling resulted in discovery of one new gasfield, Hollis Lake; two additional producing zones were discovered by subsequent development drilling.

Digitized by Google

**Cross.**—Production of sand and gravel was of major importance to the economy of Cross County. Commercial producers were Humphries and Kail, McGeorge Contracting Co., and Cross County Gravel Co.

**Franklin.**—Increases in production of natural gas and coal were sufficient to rank the county first in natural gas production and third in coal production. Exploratory drilling resulted in discovery of the new Altus gasfield. Development-well drilling was markedly successful; 16 of 17 field wells drilled were gas producers. Athletic Mining and Smelting Co. reported a quadruple completion in the Aetna gasfield. Additional reserves were reported for Cecil, Aetna, Rock Creek, Ozark, White Oak, and Lone Elm gasfields. Increased coal production from the Quality Excelsior Coal Co. strip mine added considerably to total value of mineral production in the county.

**Garland.**—Crushed sandstone, produced by Ben M. Hogan & Co., accounted for a substantial increase in mineral production value. Norton Pike Co. purchased novaculite, mined near Hot Springs, for shipment to its plant in New Hampshire. Oilstones and grinding pebbles were made from novaculite by Arkansas Abrasives, Inc., Arkansas Oilstone Co., and Jackson Whetstone Co. Pit-run gravel for various purposes was produced by Smith Bros. Construction and Materials Co.

**Grant.**—Southwest Concrete Material Corp., near Poyen, used clay from a nearby pit as raw material in its lightweight-aggregate plant. Sand and gravel overlying the clay was processed and used mostly as aggregate in concrete pipe.

**Greene.**—Arkansas Gravel Co. and B&S Gravel Co. produced building and paving sand and gravel. Ted Cline mined pit-run gravel for fill.

**Hempstead.**—Miscellaneous clay for building brick and other heavy clay products was mined by Hope Brick Works. Exploratory drilling for oil was unsuccessful during the year. Seven crew-weeks of geophysical exploration were reported.

**Hot Springs.**—Crude barite, the county's most important mineral, was mined and ground by Baroid Division of National Lead Co. and Magnet Cove Barium Corp. Acme Brick Co. (Perla plant) and Malvern Brick & Tile Co. mined fire clay for refractories and heavy clay products. Acme Brick Co. (Malvern plant) used miscellaneous clay for building brick and tile. Coogan Gravel Co. and Harbison-Walker Refractories Co. mined and processed rock for use in silica refractories. Malvern Minerals Co. produced finely ground silica sand for use in a liquid grinding operation especially useful for finishing small, cast-metal parts. Freshour Bros. and Malvern Gravel Co. produced building and paving sand and gravel. The Jones Mill aluminum-reduction plant of Reynolds Metals Co. operated throughout the year.

**Howard.**—Ideal Cement Co. mined chalk, marl, sand, and limestone for cement manufacture at its plant near Okay.

**Independence.**—Total value of mineral production in 1960 decreased considerably due to cessation of the Government manganese program. Hydrated lime and quicklime for industrial, chemical, and building uses were produced by Batesville White Lime Co.; the company also quarried and crushed limestone for soil conditioner, metallurgical

615629—61——10

Digitized by Google

flux, asphalt filler, mineral food, concrete aggregate, and other purposes. Batesville Marble Co. quarried marble for processing at its Little Rock plant. Stone Products Co. quarried marble at pits near Batesville. Sandstone for building purposes was quarried and sawed by Varnell Sandstone Quarry, Oran McBride Stone Quarries, Salado Stone Co., and Bristow Stone Co. Sand and gravel for building and fill was produced by Galloway Sand & Gravel Co. at Batesville.

**Izard.**—Izard County ranked third in value of stone production and first in value of sand output. Aluminum Company of America and Arkansas Limestone Co. mined and crushed limestone for metallurgical flux and soil conditioner. A substantial contribution to total mineral production value resulted from high-grade silica sand mined and ground by Silica Products Co., Inc., at Guion. The finished material was used in making glass, foundry molds, pottery, and other products.

**Jackson.**—Sand and gravel for structural use and paving was produced by Mobley Construction Co., Inc.

**Johnson.**—Johnson County ranked first in value of coal mined. Open-pit and underground mines were operated to furnish coal for steel mills and other uses. Eureka Brick & Tile Co. mined clay for heavy clay products. Exploratory drilling resulted in discovery of the new Ludwig gasfield. Development-well drilling located additional reserves in the Union City, Spadra, and Coal Hill gasfields.

**Lafayette.**—The petroleum and natural gas industries contributed the major part of mineral production value. The county led in output of byproduct elemental sulfur, and ranked second in production of natural gas liquids, and third in production of crude petroleum and natural gas. Exploratory and development drilling resulted in discovery of one new gas-condensate field, Lake Erling, and new oil pools in the Lewisville, New Garland City, and Stamps fields. A new producing depth record (11,005 to 11,025 feet) was established by a gas-condensate producer in the new Lake Erling field.

Sand and gravel for building and paving was mined and processed by Meriwether Gravel Co., Inc.; Lambert & Barr, Inc., furnished pit-run gravel for fill. Olin-Mathiesen Chemical Corp. recovered elemental sulfur from natural gas at its McKamie plant.

**Lawrence.**—Ben M. Hogan & Co. and Verkler Limestone Co. quarried and crushed limestone for roadstone, riprap, and soil conditioner. L. F. Parker furnished pit-run gravel for county road construction; Ben M. Hogan & Co. mined sand and gravel for use by the Arkansas State Highway Department as road base and surfacing.

**Little River.**—Increased cement output by Arkansas Cement Corp. caused a corresponding gain in marl and limestone production in the county. Ark-La Limestone Corp. quarried and processed limestone for agricultural use. Braswell Sand & Gravel Co., Inc., produced building and paving sand and gravel at a stationary plant near Wilton.

**Logan.**—Dimension sandstone was quarried and processed by Logan County Building Stone Co., River Mountain Stone Co., and Spicer Stone Co. Stone was quarried and sawed by Schwartz Quarry.

Two underground bituminous coal mines utilized cutting machines to produce high-grade coal for shipment to northern markets.

Digitized by Google

A substantial increase in natural gas production was reported in 1960. Development well drilling resulted in extensions of the Chismville, Booneville, and Aetna gasfields.

**Madison.**—Ozark Construction Co. quarried and crushed limestone for road construction; War Eagle Lime Co. produced agricultural limestone at a quarry near Huntsville.

**Marion.**—Rush Creek Mining Co., near Yellville, shipped zinc concentrate. Sand and gravel for road construction was produced by Freshour Corp. and Kenneth D. McDowell.

**Miller.**—Petroleum production contributed 84 percent of the total value of mineral output. The county ranked second in value of sand and gravel production and fourth in value of clay production. Gifford-Hill Co., Inc., furnished sand and gravel for building, paving, fill, and other purposes. W. S. Dickey Clay Manufacturing Co. mined fire clay and miscellaneous clay at pits in Texarkana.

Exploratory and development drilling resulted in rediscovery of the small Lenz field and extensions of the Genoa, Fouke North, Kiblah, and Christmas fields.

**Mississippi.**—Elliott Sartain & Co. furnished gravel for county road construction and maintenance.

**Montgomery.**—Slate was quarried and processed to slate flour and roofing granules by Bird & Son, Inc. Crude barite was shipped from stock by Baroid Division of National Lead Co. Specimen-grade quartz crystals were found near Mount Ida by Coy Drain and Ocus Stanley.

**Nevada.**—Crude petroleum contributed essentially all the 1960 mineral production value. Development drilling established additional reserves in the Troy oilfield. Berry Asphalt Co. operated an oil refinery at Waterloo.

**Ouachita.**—Crude petroleum and sand and gravel accounted for most of the value of mineral production in the county. The productive Smackover field received the major part of development well drilling and accounted for over 90 percent of the petroleum produced. Successful completion of a new pay in the Cotton Valley formation created considerable interest and activity in the Smackover field. Pool unitization and water-injection programs facilitated recovery of petroleum from Wesson, Stephens, and Center oilfields. Berry Asphalt Co. operated an oil refinery at Stephens.

Building and paving sand and gravel was mined and processed by Pine Bluff Sand & Gravel Co., Standard Gravel Co., and Henry Garner. Hope Brick Works mined miscellaneous clay for brick and tile manufacture at its Chidester plant.

**Pike.**—Dulin Bauxite Co. produced gypsum for use as a retarder in portland cement. The company completed new facilities at the plant near Highland to allow better quality control of the finished product. Several diamonds were found in the Murfreesboro area; three outstanding finds at the Crater of Diamonds weighed from 4.5 to 6.5 carats.

**Poinsett.**—St. Francis Material Co. and Crowder Construction Co. mined and processed sand and gravel for building and paving purposes. Arkansas State Highway Department used part of the aggregate for road construction.

Digitized by Google

**Pope.**—Mid-Continent Stone and Construction Co. quarried and crushed limestone, for riprap in the Arkansas River. U.S. Army Corps of Engineers contracted for a substantial quantity of sandstone to be used as riprap and concrete aggregate. Texas Ledgestone Co. produced dimension sandstone and flagging.

P&M Coal Mining Co. operated a strip mine near Russellville and produced coal for smelter consumption.

Exploratory and development drilling resulted in discovery of the Scottsville gasfield and additional gas reserves in the Dover field.

**Pulaski.**—Stone requirements for riprap, concrete aggregate, road construction, and railroad ballast made Pulaski County the leading supplier of crushed sandstone. Producers were Jeffrey Stone Co. and Ben M. Hogan & Co. Limestone was quarried and crushed by D. F. Jones Construction Co. and Reynolds & Williams. U.S. Army Corps of Engineers contracted for both sandstone and granite to use as riprap. Big Rock Stone & Materials Co. quarried and crushed syenite for use as riprap, concrete aggregate, roadstone, railroad ballast, and roofing granules. Big Rock Stone & Materials Co. and Jeffrey Stone Co. supplied sand for building and paving; John D. Ott furnished pit-run gravel for use as fill.

A. P. Green Fire Brick Co. and Consolidated Chemical Industries Division, Stauffer Chemical Co. processed high-alumina clays from deposits near Little Rock.

Bauxite was mined or shipped from stock by American Cyanamid Co., Campbell Bauxite Co., Dickinson-McGeorge, Inc., Porocel Corp., Reynolds Mining Corp., and Consolidated Chemical Industries Division, Stauffer Chemical Co. Three companies operated drying, and activating plants to process bauxite for abrasives, chemicals, and other industrial uses.

**St. Francis.**—St. Francis Material Co. and J. J. Crisp Gravel Sales produced sand and gravel for construction, paving, and fill.

**Saline.**—Total value of mineral production reached a new high, mainly due to a substantial increase in bauxite production. Bauxite, the county's leading commodity, was produced by Reynolds Mining Corp., Aluminum Company of America, and American Cyanamid Co. Aluminum Company of America also made lime from Izard County limestone.

Milwhite Co., Inc., quarried and processed soapstone and slate for filler in asphalt, insecticides, roofing, and rubber. Structural and paving sand and gravel were produced by East Arkansas Materials Co., Richards Equipment Co., and others.

**Sebastian.**—Coal mined from six underground and three strip mines was the county's most important mineral industry. Total production of coal dropped considerably from 1959, almost entirely because of less output from the underground mines of Peerless Coal Co. and Quality Excelsior Coal Co. A major part of the coal mined was used by steel mills. Crushed sandstone, for use as riprap on the Arkansas River, was produced for U.S. Army Corps of Engineers. Acme Brick Co. mined miscellaneous clay for brick and tile. Rescolite Co. made lightweight aggregate from locally mined shale.

Development drilling during the year discovered additional natural gas reserves in the Gragg, Massard Prairie, and Cecil fields.

Digitized by Google

**Union.**—Union County ranked second in total value of minerals produced, second in petroleum, and third in natural gas liquids. Crude petroleum production accounted for 94 percent of the mineral value. Exploratory drilling resulted in finding the Cypress Creek oilfield. Development-well drilling increased known oil reserves in the Camp Creek, Cypress Creek, Lick Creek, and Smackover fields, as well as gas-condensate reserves in the Olin Forest field. Pressure maintenance and secondary recovery projects were carried out in several of the older gas-condensate and oilfields. According to the Arkansas Oil & Gas Commission, the operations will permit recovery of an additional 40 million barrels of oil from the fields.

Michigan Chemical Co. increased the annual capacity of its plant near El Dorado to 10 million pounds of elemental bromine. Value of bromine, recovered from oil-well brines, contributed substantially to the county's economy.

Lion Oil Co., Denton Corp. (formerly Mobil Oil Co. plant), and J. R. Querles Oil Co. operated cycling and natural-gasoline plants.

**Washington.**—Ben M. Hogan & Co. quarried and crushed sandstone for State road construction; McClinton Bros. and Ozark Construction Co. mined and crushed limestone for concrete aggregate, roadstone, and soil conditioner. McClinton Bros. completed plant improvements which included installation of natural gas engines to drive a 175-kw power plant. Considerable savings in fuel costs were reported by the company.

**White.**—Acme Materials Co. quarried and crushed a substantial quantity of sandstone for riprap, concrete aggregate, roadstone, and railroad ballast. Arkansas State Highway Department used part of the material for road construction and maintenance.

# The Mineral Industry of California

**This chapter has been prepared under a cooperative agreement for the collection of mineral data between the Bureau of Mines, U.S. Department of the Interior, and the California Department of Natural Resources, Division of Mines.**

By L. E. Davis,[1] R. Y. Ashizawa,[2] and L. Giorgetti[2]

MINERAL production in California declined in value for the third consecutive year decreasing to $1,402,214,000, 2 percent below 1959. The value of mineral fuels as a group continued the downward trend begun in 1958 despite an increase in the value of natural gas. Production of nonmetals reversed an 8-year trend, declining 2 percent in value below 1959. Increases in the values of natural saline minerals were noteworthy exceptions to this general

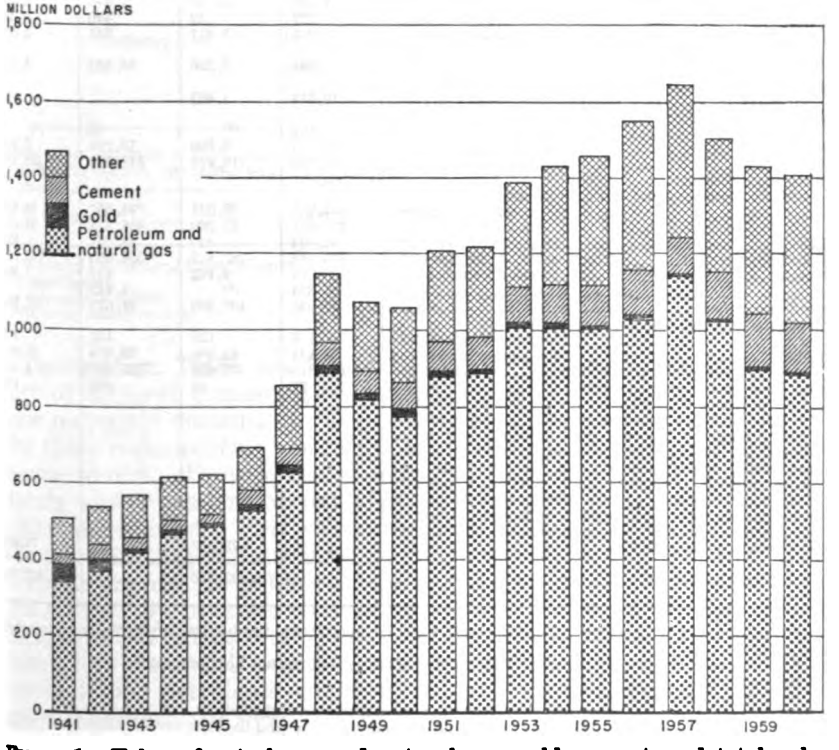

FIGURE 1.—Value of petroleum and natural gas, gold, cement, and total value of mineral production in California, 1941–60.

Digitized by Google

decline. Metals as a group rose 4 percent in value over 1959, largely because Union Carbide Nuclear Co. attained full-scale production at its Pine Creek ammonium-paratungstate plant in Inyo County. Only gold and molybdenum decreased both in quantity and value. Uranium output remained virtually unchanged from 1959. For the first time in several years neither manganese nor chromite ores were produced or shipped.

**TABLE 1.—Mineral production in California [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Barite.....short tons | 28,143 | $326 | 16,157 | $181 |
| Boron minerals.....do | 619,946 | 46,150 | 640,591 | 47,550 |

**Employment and Injuries.**—Preliminary 1960 data compiled by the Federal Bureau of Mines for the mineral industries other than mineral fuels, indicated a decline from 1959 in employment approximately 3 percent. Employment reflected production fluctuations with about a 14 percent rise in employment at metal mines and mills, and a 5 percent decrease at nonmetal mines, quarries and plants. Nonfatal injuries were lower in both categories; however, fatalities rose from 1 to 2 at metal mines whereas those attributed to the nonmetals group were unchanged from the preceding year at 9. Injuries per thousand workers were appreciably below 1959.

California participants in the Bureau of Mines 1960 National Safety Competition reporting no lost-time injuries during the year included 1 cement plant, 1 nonmetal open pit, 8 quarries, 13 sand and gravel operations, and 1 lime producer.

**TABLE 2.—Employment and injuries in the mineral industries[1]**

| Industry | 1959[2] | | | | 1960[3] | | | |
|---|---|---|---|---|---|---|---|---|

**Consumption, Trade, and Markets.**—California led all States in diversity of mineral commodities produced and in the value of mineral raw materials consumed. Consumption exceeded production except for those commodities where the State was the sole or principal domestic source. Despite the abundance of its mineral resources, California was dependent on out-of-State producers to supply some mineral requirements. This was particularly true of mineral fuels. Consumption of major petroleum products was up 4 percent from 1959. Foreign imports of crude oil rose 18 percent above 1959 and natural gas receipts by pipeline were up almost 100 billion cubic feet. California ranked third, after Texas and Louisiana, in output of mineral fuels; however, with population second only to New York, the State led in liquid petroleum consumption and ranked second in natural gas utilization. In 1960, the State had over 8.5 million motor vehicle registrations and more than 20,000 gasoline service stations, exceeding all other States. Tax revenue from fuel, transportation, and vehicle taxes was one-fifth the total tax revenue in California for 1960.

The diversity of metal and mineral commodities produced, nearly 50 percent more than the second ranking State, necessitated a wide variety of marketing practices. As the sole domestic source of boron and iodine and virtually all the rare-earth minerals, all or most

Digitized by Google

of those commodities went to out-of-State markets. The same was also true in those instances where sources within the State yielded more than 50 percent of total domestic production (diatomite, sodium compounds, mercury, and tungsten). As its own best market, California used a tonnage of sand and gravel that was nearly double the output of the next leading State. The State led all others in production of gypsum and yet imported a large tonnage from Mexico. Deposits in neighboring States supplied many nonmetallic raw materials processed in California to meet local requirements. Some processors were also producers; others purchased or custom-milled the minerals for customers. Metal ores and concentrates were processed out of State, except for the American Smelting & Refining Co. Selby smelter, treating primary nonferrous material, ores and concentrates; the Kaiser Steel Co. integrated steel plant at Fontana, utilizing iron ores and concentrates; and the Union Carbide Nuclear Co. Pine Creek processing plant for tungsten ores and concentrates.

**Trends and Developments.**—Although the predicted planned industrial and residential expansion did not occur in 1960, a number of important developments were of special significance in the mineral industries.

In December, the largest California gas discovery in several years was made in the Los Medanos area, Contra Costa County. Initial measured tests through a restricted orifice indicated 8 million cubic feet, with an unrestricted flow exceeding 100 million cubic feet per day. Oil production was recorded for the first time in Solano County after a light gravity oil source was discovered in the Winters gas field by Texaco Co. Pacific Gas & Electric Co. had under development the Nation's largest underground natural gas storage, the depleted McDonald Island gasfield in the San Joaquin River delta. The project was scheduled for completion in 1961. Shell Oil Co. announced plans to construct a new plant at Martinez for refining lubricating oils by catalytic hydrogenation. The plant, first of its kind in the West, will have a 500-barrel daily capacity.

The $5 million white cement plant under construction at Crestmore by Riverside Cement Co. was expected to be in production in 1961. New Pacific Rolling Mills, Inc., placed a 150,000-ton stainless-steel plant in production at Cucamonga, San Bernardino County, first of its kind on the West Coast. The first fully automatic aluminum extrusion plant in the western United States was placed in operation at San Jose by American International Aluminum Corp.

Westinghouse Electric Corp. submitted the low bid for the Pt. Loma (San Diego) plant for converting sea water to fresh water. Plans called for production of 1 million gallons of fresh water per day for 20 years, using the multistage flash-distillation process. Union Carbide Nuclear Co. expanded its tungsten refinery to include two new company-developed processing steps and produced high-purity amonium paratungstate throughout the year. Celtor Chemical Corp. began operating its mill near Hoopa, Humboldt County, early in the year. The company treated copper ores from its Copper Bluff mine and shipped most of the copper concentrate produced to out-of-State smelters. Southern Pacific Pipe Lines, Inc., began constructing a $2 million, 8-inch, 70-mile underground pipeline from the Port of Stockton ore dock to two jet fuel storage tanks three miles from Castle Air Force Base. The pipeline was planned for completion before mid-1961. Before yearend, two Canadian provinces, Alberta and British Columbia, and four States, Idaho, Washington, Oregon, and California, were the scenes of right-of-way clearing and ground preparation for the 1,400-mile pipeline that will transport natural gas from Alberta fields to northern and central California. The project was expected to be finished late in 1961.

About midyear Pacific Gas & Electric Co. placed its Sonoma County steam-generating plant under test. Late in the year this 12,500-kilowatt turbine generator, operating on natural steam from wells at "The Geysers," was dedicated by the company at the plant site.

**Legislation and Government Programs.**—Public Land Orders, which had withdrawn land in California in connection with the prosecution of World War II, were revoked. Involved were 5,920 acres on the

Digitized by Google

northern edge of the Avawatz Mountain Range and 1,360 acres east of U.S. Highway 395 about 6 miles south of the junction with U.S. Highway 466 in San Bernardino County.

Four Defense Minerals Exploration Administration (DMEA) contracts, under the supervision of the Office of Minerals Exploration (OME), for mineral exploration in California, were still in effect at the beginning of 1960. Two OME contracts for mercury, one each in Yolo and Lake County, were let in May and July, respectively, and one for copper in Inyo County, in September. Of the seven contracts in effect all or part of the year, only one for mercury was active at yearend.

Bureau of Mines resources work conducted in 1960 encompassed the collection and dissemination of mineral production statistics in California, in cooperation with the California Division of Mines. Resources investigations included: The mercury potential of California (as a part of the total domestic potential); beryllium and other rare-metals studies; and the beginning of surveys of chemical (mineral) raw materials and clay resources in California. The Bureau of Mines completed a reconnaissance sampling of a beryllium deposit near Lone Pine, Inyo County. The property was subsequently optioned to a Nevada mining company that conducted an intensive drilling program. Under a cooperative agreement with the California Division of Mines, reconnaissance sampling of two northern California nickeliferous laterite areas was completed by the Bureau and plans were made for a similar project at fire clay deposits in central California. Other projects under the cooperative agreement comprised slope stability studies at Boron, Kern County, recovery of tungsten and molybdenum from California scheelite ores, and the recovery of alumina from a large deposit of anorthosite in southern California.

In cooperation with the University of California Lawrence Radiation Laboratory, work on pure metals development was conducted at the Boulder City Research Laboratory, Nevada. The Bureau's Berk-

eley Thermodynamics Laboratory in California conducted thermochemical studies of the rare and precious metals as a joint effort with the Reno Metallurgy Research Center, Nevada, of which the Berkeley Laboratory is a part. The San Francisco Petroleum Research Laboratory continued its basic and applied research in the broad field of petroleum production, including evaluation of methods of predicting oil-reservoir performance with particular reference to oil-recovery efficiencies, well completion studies, and the application of secondary recovery techniques.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

**Carbon Black.**—The Pittsburg (Contra Costa County) plant of Shell Chemical Corp. produced a carbon (furnace) black from natural gas as a byproduct of ammonia-fertilizer manufacture. The carbon product, a thermal black, was sold for use in open-hearth steelmaking. Although no pigment black was produced, the company planned to produce a rubber-grade black by the end of 1961.

At yearend, two more California carbon black plants had been planned. The first was a joint effort of Witco Chemical Corp. and Continental Carbon Co., to be located in Bakersfield. The feed stock for this plant was expected to be heavy fuel oil. United Carbon Co. purchased a site near Mojave for the second plant, which will produce a black of the furnace variety from fuel oil. Output from this plant will be consumed by the rubber, paint, and ink industries.

**Carbon Dioxide.**—The Honolulu Oil Company carbon dioxide separation process at its natural gasoline plant in Taft, Kern County, was operated throughout the year. As a result carbon dioxide output greatly increased over 1959, the year the plant was built. The product was used in manufacturing "dry ice," and was sold to aircraft companies for "freezing" rivets and to bottlers for carbonated beverages. Demand for carbon dioxide could increase appreciably in view of its potential use in carbonated-water secondary-oil-field recovery programs. Experimentation conducted elsewhere in the Nation could find application in some California fields.

**Coal (Lignite).**—All commercial lignite mining in California was done near Ione, Amador County, at a strip mine in the West Belt district. The lignite was mined chiefly for the montan wax content, not for fuel. The wax was consumed in manufacturing carbon paper, phonograph records, polishes, and rubber products. More lignite was mined in 1960 than in 1959, to meet the demand for the wax.

**Coke.**—Coke production in California was relatively small in comparison with that of some other States, but was important in metallurgical uses. Coke for metallurgy had been produced since 1943. Most of the California coke was produced at the Kaiser Company Fontana steel plant from coal mined in Utah and Arkansas. Most local coals are unsuitable for coking because of their high ash content, which results in structural weakness of the produced coke. Coke production had materially increased during the past few years, and production in 1960 was 11 percent above that of 1959.

Digitized by Google

**Natural Gas.**—Net withdrawals of natural gas reached 517,535 million cubic feet, up 7 percent from 1959. The volume obtained from dry gas zones represented one-third the total; oil zones yielded two-thirds. Less than 1 percent of the total withdrawals was vented or wasted (blown to air). During the year, 112 new gas wells were completed in dry gasfields, 32 more than in 1959. The great interest in gas exploration in the Sacramento Valley resulted in the discovery of 13 new dry gasfields. In addition, there were 15 new pool discoveries in oil fields and 14 new outposts or extensions, making a total of 42 finds out of 189 wildcats drilled for gas. The Trico area led all others with 13 new development wells, followed by the Arbuckle and McMullin Ranch areas with 10 each. The total injected gas used for repressure and pressure maintenance operations increased 2 percent over 1959 to 235,819 million cubic feet.

At yearend the depleted McDonald Island gasfield was being prepared for storage of out-of-State gas with a maximum capacity of 124,500 million cubic feet, largest in the world. An injection

Digitized by Google

pumping and control center was nearing completion. The continued increase in gas well completions was indicative of the constantly increasing demand for gas coupled with the comparatively fast payout for gas wells as compared with oil wells in California. The new 1,400-mile, 415-million-cubic-foot, Alberta-to-San Francisco gasline, designed to supplement local gas, will have its high load factor much enhanced by connection to the McDonald Island field. The Alberta line was expected to be completed in 1962.

As of December 31, 1960, California natural gas reserves in million cubic feet were estimated at: 6,182,656, "residue" oil well; 2,569,684, dry gas; and 69,598, underground storage. The total was up 3 percent from 1959.

**Natural Gas Liquids.**—Processing plant capacity rose 19 percent and the number of plants, including one fractionator, increased from 68 to 70. Three plants were built, and one was dismantled during the year. Despite a slight increase in volume of gas processed, total products declined 2 percent below 1959 figures as a 3-percent rise in LP gas output did not offset a 5-percent decline in yield of natural gasoline and cyclic products. Much of this change took place in Kern and Fresno Counties. Price changes in the petroleum industry lowered the dollar value of all natural gas liquids 3 percent from the 1959 level. Natural gasoline and cycle products constituted two-thirds and LP gases, one-third of the total production.

LP gas production roughly paralleled the national average of 11 percent, but producer estimates indicated total California reserves declined 4 percent. California sales were expected to increase further in 1961 if consumption at a planned tire plant materializes. In California alone, LP gas sales had risen about 4,000 percent since 1922. Presumably much of the projected increase through 1970 will be in commercial-industrial sales including internal combustion, chemical, and synthetic uses. Daily shortages in supply probably will occur, possibly aggravated by lack of sufficient storage, since California has no salt domes or mined caverns suitable for storage. Maximum LP gas withdrawal rates from water-sand storage reservoirs were low as reported by one company using this type of storage. Generally, LP gas supply was expected to increase because of the freeing of local source gas by entry of new methane lines from out-of-State. Two of these lines were either being built or planned, and a third was under consideration.

**Peat.**—Production and sales of peat were about 4 percent below 1959 figures. Two operators in Contra Costa County and one each in Modoc, Orange, and Riverside Counties furnished the State output. Reed-sedge peat from Contra Costa and Riverside Counties represented 73 percent of the tonnage sold; moss peat from Modoc County, 24 percent; and Orange County peat humus, the remaining 3 percent. Soil improvement uses consumed 90 percent of the output; 95 percent of the tonnage sold was prepared (shredded), and 42 percent was packaged. Approximately 97 percent of the total shipments went to California consumers; the remaining 3 percent was consigned to Nevada, Arizona, Oregon, Washington, Texas, and Utah customers.

**Petroleum.**—Crude petroleum production was 1 percent under the 1959 figure. Shut-in capacity was virtually nonexistent at yearend,

Digitized by Google

having declined from about 6,000 barrels a day in January. The lower yield was a continuation of a decline begun in 1955. The wider gap between consumption and production was made up chiefly by an 18-percent increase in imports over 1959. However, pipeline receipts from New Mexico and Utah declined 3 percent for the same period. Imports totaled nearly 24 percent of the refinery input.

In 1960, 1,880 notices to drill were filed, 338 more than in 1959. During the year, 1,259 new producing wells were completed, including 29 service wells. Of the total, 657 were heavy-gravity producers (below 20°) and 602 were light-gravity. Development completions by region were as follows: San Joaquin Valley, 877 wells; Coastal, 188; and Los Angeles, 194. A total of 1,218 oil wells was drilled in California during 1960, of which 28 were exploratory. There were 4 new field discoveries and 13 successful new pool finds. At yearend 37,394 wells were producing crude oil, 856 more than in 1959. The increase was largely the result of an accelerated heavy-oil developmental-drilling program. Of 211 wildcats drilled for new fields in 1960, the discovery ratio was 1 new field for 11 dry holes drilled. In comparison, the ratio for the United States was 1 for 8.

Average crude-oil input to California refineries rose 3 percent, more than 30,000 barrels a day above 1959. The number of physical refining plants remained unchanged at 37, and refinery capacity increased less than 1 percent. Significant gains were noted in hydrogen treatment and vacuum distillation. "Hydrofining," "unifining", or other similar process was under consideration by one company. No new coking facilities were added, but one new plant was planned for construction in 1961. Some California refiners processed foreign crudes for the first time.

The year was marked by increased use of secondary recovery processes. Overall, 20 new injection projects were begun. Of all projects in progress, only those using gas injection remained constant. The total water injected into all oil sands in California increased 5 percent to 707,744 barrels a day. The number of such projects rose from 83 to 98, but average rate of production was down from 8,139 barrels a day in 1959 to 7,149 barrels a day. The Wilmington field alone represented 48 percent of the State's waterflood total. At one pool of the Midway field, preliminary work on a slug-type miscible-phase displacement program was in progress using liquid propane. Plans for separating the injected propane from produced liquids were being considered. In a secondary program at Coalinga field, steam was being injected to reduce high oil viscosity and to promote production. One injection, two producing, and four temperature-observation wells were used in a pattern with the observation wells on a circle 90 feet from the injector. The producing wells are 180 feet from the injector, which received 60 tons of steam a day at 600 pounds pressure.

## NONMETALS

**Asbestos.**—Production and sales of chrysotile asbestos declined 63 percent in 1960. The Phoenix mine, operated by Asbestos Bonding Co., Division of Clute Corp., was the principal producer. During the year the company converted its pilot plant to commercial opera-

Digitized by Google

tion. Shipments were made to consumers in the San Francisco Bay area for use in cement, stucco, and various insulation products. Small quantities were shipped to State highway agencies in California and Colorado for testing as a component in various paving mixes.

Exploration and development activity was stepped up by several companies at known deposits in the Santa Rita Mountain area, Fresno County. Union Carbide Nuclear Co. and Coalinga Asbestos Co., Inc. (a joint venture of Johns Manville Corp. and Kern County Land Co.), acquired extensive holdings that were explored by bulldozer stripping and trenching and by auger and bucket drilling. Shipments of crude ore were made to company-owned plants for experimental testing by both operators. National Mill and Mining Co. explored deposits in the same area and completed test runs at its mill in Coalinga. Jefferson Lake Asbestos Co. continued its exploration program at an asbestos deposit in Calaveras County by diamond-drilling and trenching. Rawhide Asbestos Co., Tuolumne County, mined a relatively small tonnage of asbestos for test purposes. Minor activity was in progress at several asbestos prospects in Shasta, Siskiyou, Trinity, and Monterey Counties. An occurrence of chrysotile asbestos was reported on Mount Diablo, Contra Costa County, but the find was not expected to be of commercial importance.

**Barite.**—Production of crude barite dropped 61 percent from 1959. The quantity sold or used declined nearly 43 percent, and end stocks were reduced by about the same percentage. Despite an apparent increase in well-drilling activity by the oil and gas industry, the tonnage of California-produced crude barite, prepared for use in well-drilling fluids, dropped more than 12 percent. Three mines, one near Yermo in San Bernardino County, and two in the 9-mile Canyon area of Tulare County, were the source of 97 percent of the crude barite sold or used by California producers. Two barite properties in Nevada County and one in Kern County contributed the remainder. Crude barite mined in Nevada was processed by one producer in a Stanislaus County chemical plant and ground by another at Merced. Relatively small quantities of ground barite were consumed in uses other than as a component of well-drilling muds.

**Boron Minerals and Compounds.**—Total U.S. production (and most of the world supply) of boron minerals came from bedded deposits in Inyo and Kern Counties and brines of Searles Lake, San Bernardino County. Total production and value increased 3 percent, compared with 1959. Refined boron compounds were produced from the Kern County borates at refineries both at the deposit and in Wilmington, Los Angeles County. A San Francisco Bay area chemical plant also used Kern County crude borates to manufacture high-purity boron compounds. During 1960 Kern County Land Corp. acquired two borax mining claims, totaling 39 acres, in Death Valley from U.S. Borax & Chemical Corp. An exploratory hole, which permitted a geologist to be lowered inside for direct subsurface work, was drilled near the open pit mine of U.S. Borax & Chemical Co. at Boron. Also, plans were made to replace 2½ miles of truck haulage with a 1,300-foot conveyor system. The conveyor, which will be located in the 315-foot-deep pit, will move up a slope of 18° from the primary crusher.

Digitized by Google

Although the use of boron in missile and rocket fuel had been deemphasized, an accelerated program, costing an estimated $10 million a year, was being directed toward other new developments and applications such as in brake fluids, plastics, metal alloys, paper coatings, and electrodes. The canceled Government contract for boron as a high-energy fuel accounted for only 1,000 tons per year loss to the industry. On the other hand, the Federal and State forest services used nearly 9,000 tons of boron products in a fire-extinguishing solution for fighting forest fires in 1960.

**Bromine and Bromine Compounds.**—Elemental bromine was recovered in processing Searles Lake brines at the Trona plant, San Bernardino County, by American Potash & Chemical Corp. The plant product was sold to chemical and pharmaceutical companies for use in compounding a wide variety of products. Production at this plant increased slightly above that of 1959, but the unit value was unchanged. Mineral Products Division, Food Machinery Corp., recovered bromine from saltworks bitterns in the company plant at Newark, Alameda County. The liquid bromine was converted to ethylene dibromide, chiefly for use as a fumigant in treating soils and seeds. Output increased 77 percent over 1959. Much of the ethylene dibromide used with tetraethyl lead as an antiknock fluid in gasoline was produced at plants in other States.

**Calcium Chloride.**—Less liquid calcium chloride was recovered by California Rock Salt Co. and National Chloride Co. from brines collected at Bristol Lake, San Bernardino County, than in 1959. Hill Bros. Chemical Co. purchased crude liquid and operated a third plant in the area to produce both a flake product and a refined liquid. Output of flake calcium chloride was higher than in 1959. The products of all three plants were marketed in Arizona, Nevada, and southern California, mainly in fireproofing materials and as hygroscopic agents. Unit values were higher than in 1959.

**Cement.**—Production and shipments of portland cement declined 8 percent and 9 percent, respectively, compared with 1959. Bulk shipments declined to 32,993,000 barrels from 36,382,000, and paper bag shipments totaled 6,719,000 barrels compared with 7,253,000 in 1959. Eight southern California cement plants in Kern, Los Angeles, Riverside, and San Bernardino Counties produced and shipped over 2 million barrels less than in 1959. Average value per barrel of southern California cement was $3.22. Five northern California plants in Calaveras, San Benito, San Mateo, Santa Clara, and Santa Cruz Counties produced and shipped about 16 million barrels, compared with 18 million barrels in 1959. Average value per barrel of northern California cement was $3.28.

Southern California plants shipped 21,601,000 barrels to southern California, 539,000 to northern California, 539,000 to Nevada, 828,000 to Arizona, and the remainder to Utah, Oregon, and Colorado. Northern California plants shipped 12,676,000 barrels to northern California, 306,000 to southern California, 284,000 to Nevada, and the remainder to Hawaii, Washington, Oregon, Alaska, and foreign destinations. Shipments of masonry cement were made from plants in Santa Clara and San Bernardino Counties.

Digitized by Google

Calaveras Cement Co. began constructing its new $14-million cement plant, designed for an annual capacity of 1.5 million barrels, 10 miles north of Redding in Shasta County. The company opened a new bulk cement transfer plant at Springfield, Oreg., to handle cement from its plant at San Andreas, Calif., until its Redding plant is completed. A $5-million, 250,000-barrel capacity, white cement plant was under construction at the Crestmore facility of Riverside Cement Co. The plant will be the first of its kind west of the Rocky Mountains devoted solely to producing white cement. The Permanente Cement Co. new 3,000-barrel bulk cement distribution plant at Eureka, Calif., was completed late in 1960 and began receiving cement from Permanente, Calif.

**TABLE 7.—Finished portland cement**

(Thousand barrels and thousand dollars)

| Year | Active plants | Estimated capacity | Production | Shipments from mills | | | Estimated consumption | Stocks at mills, Dec. 31 |
|---|---|---|---|---|---|---|---|---|
| | | | | Quantity | Value | | | |
| | | | | | Total | Average per barrel | | |
| 1951-55 (average) | 11 | 35,196 | 31,939 | 31,718 | $90,026 | $2.84 | 27,738 | 1,714 |
| 1956 | 12 | 42,882 | 39,547 | 39,290 | 120,511 | 3.07 | 35,872 | 2,180 |
| 1957 | 13 | 50,150 | 38,371 | 37,731 | 117,852 | 3.12 | 33,388 | 2,956 |

| 1959 | 13 | 51,555 | 43,635 | 43,635 | 138,506 | 3.17 | 38,648 | 2,480 |
| 1960 | 13 | 51,755 | 39,892 | 39,712 | 128,826 | 3.24 | 35,330 | 2,663 |

**Clays.**—Production of clays and shale gained 6 percent in quantity (2,899,000 tons in 1960) chiefly because of the increased tonnage of miscellaneous clays and shale produced and stockpiled for use in manufacturing portland cement. Forty-three percent of the total output was used for brick, tile, and sewer pipe; 28 percent for cement; 21 percent for lightweight aggregate; and the remainder for industrial uses, principally refractories. More than 2.4 million tons of miscellaneous clay and shale was produced in 25 counties. Los Angeles, San Mateo, Solano, Ventura, and Riverside Counties yielded 1.4 million tons. Eight counties, led by Amador, Placer, and Riverside, were the source of 415,000 tons of fire clay used in heavy clay products and refractories. Kaolin production of 14,000 tons in Mono and Orange Counties was virtually unchanged from 1959. Ball clay was mined in San Bernardino and Stanislaus Counties for tile, whiteware, and pottery. Two producers in Inyo County mined fuller's earth for filler, filter, and absorbent uses. Inyo, San Benito, and San Bernardino Counties were sources of an increased quantity of bentonite produced for various industrial applications. Nearly 2,300 tons of bentonite was used with borates in a fire-retardant mixture by Federal and State forest services to fight California's forest fires during 1960. Fresno Agricultural Chemical Co. announced that as a result of a Bureau of Mines publication [3] the company began mining and processing bentonite for use in oil-well drilling muds.

[3] Anne, Q. A., Caraway, W. H., Morris, F. C., and Gates, G. L., Evaluation of a California Bentonitic Clay for Use in Oil-Well Drilling Muds: Bureau of Mines Rept. of Investigations 5487, 1959, 44 pp.

Digitized by Google

The search for new deposits of high-grade clays continued. Exploration was in progress in the Castle Mountains, San Bernardino County, to locate a possible extension of the Hart clay deposit. Extensive clay deposits of possible commercial interest were discovered on the north slope of the San Gabriel Mountains in Los Angeles County. An exploration project was begun on the southern extension of the Ione clay formation in the Cooperstown area in Stanislaus and Tuolumne Counties under a cooperative research study agreement between the Bureau of Mines and the California State Division of Mines.

**TABLE 8.—Clays production, by counties**

| County | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Alameda | 33,887 | $76,280 | (1) | $69,661 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[2] Includes Calaveras, Fresno, Marin, Placer, Sacramento, San Benito, San Mateo, Santa Cruz, Solano, Sutter, Ventura, and Yuba Counties, and counties indicated by footnote 1.

**Diatomite.**—Output of diatomite came principally from open-pit operations in Santa Barbara County. Lesser but important tonnages were mined in Kern and Napa Counties. In most instances, the material was processed in mills at the pit sites. More than half the diatomite was sold for filter aid, but appreciable tonnages were used for insulation, fillers, absorbents, pozzolan, lightweight aggregate, and admixture material. Despite a slight decrease in sales of diatomite, compared with 1959, the total value increased because of relatively higher unit prices for insulation and filter aid products.

**Feldspar.**—Dune sands of the Monterey peninsula were mined for their feldspar content by Owens-Illinois and Del Monte Properties Co. The former removed heavy minerals by magnetic separation and used the feldspathic sand in glass manufacture. The latter used froth flotation to remove heavy minerals and to produce feldspar and silica concentrates. The plant products were blended and ground to consumer specifications and sold for a variety of uses. The major consuming industries were glass, sanitary ware, pottery, tile, and other ceramic products. Crude feldspar produced from the Beck open-pit

Digitized by Google

mine in San Bernardino County was custom ground in Los Angeles and used by Gladding, McBean & Co. in manufacturing ceramic products.

**Fluorspar.**—Production of fluorspar was limited to one operation in the Clark Mountain area, San Bernardino County. Open-pit mining yielded a relatively small tonnage of crude ore that was concentrated to ceramic-grade fluorspar in the company's flotation plant. The plant product was shipped to glass manufacturers in Ohio and the Los Angeles area. Fluorspar mined in other States continued to supply the requirements of most California fluorspar consuming industries, particularly for metallurgical-grade material.

**Gem Stones.**—Commercial and amateur collectors, mineralogical societies, and gem dealers collected a variety of gem materials and mineral specimens in 41 counties. Agate, jasper, obsidian, petrified wood, onyx, and jade were the principal gem materials gathered. San Bernardino County was the source of the greatest variety, followed by Kern and Riverside Counties. More than 30,000 pounds of agate and jasper was collected in San Bernardino County. The Davis Creek and Lassen Creek areas of Modoc County yielded small quantities of obsidian. Lapis lazuli, a deep blue gem stone also known as the "sapphire of the ancients," was mined in the San Antonio Canyon area of San Bernardino County. Other varieties of gem materials and specimens collected included significant quantities of chalcedony, colemanite, garnet, howlite, idocrase, kyanite, lepidolite, lithiophillite, marcasite, opal, quartz crystal, rhodonite, verd antique, and vesuvianite.

**Gypsum.**—Mine production of crude gypsum and gypsite declined 4 percent from the 1959 record high of 1,686,000 tons, to 1,616,000 tons. Output was adversely affected by early rains and a period of foggy weather in the San Joaquin Valley farm areas and to a lesser degree by a decline in residential construction. Production and sales of California-produced agricultural gypsite were 892,000 tons and 878,000 tons, respectively, a 7-percent decrease compared with 1959. Sales of agricultural gypsite, including material from out-of-State sources, rose from 1,010,000 tons in 1959 to 1,086,000 tons, according to preliminary figures released by the California Department of Agriculture. Mines in Kern County alone yielded 730,000 tons during the year; gypsite deposits also were worked in Kings, Merced, San Luis Obispo, and Santa Barbara Counties, solely for agricultural use.

Rock gypsum was mined in Imperial and Riverside Counties for use in manufacturing building products, and in Ventura County for use as a retardant in portland cement. A plant in Alameda County recovered gypsum as a byproduct of magnesia produced from salt-works bitterns and sold most of the product as a cement-retardant and for agricultural use. Calcining plants were operated at plaster and board mills in Alameda, Contra Costa, Imperial, Los Angeles, and Riverside Counties.

**Iodine.**—One producer in California, Dow Chemical Co., produced virtually all the domestic crude iodine. The company recovered iodine from waste oil well brines of the Los Angeles basin in its Seal Beach plant, Orange County. The Deepwater Chemical Co., Ltd.,

Digitized by Google

recovered a few hundred pounds of iodine from well brines of the Dominques field in its Compton plant, Los Angeles County, early in 1960, and produced iodine products the remainder of the year from purchased crude iodine. The quantities of crude iodine produced and used by the producer in other products were 30 and 20 percent lower, respectively, than in 1959. However, consumer demand rose sharply and sales increased 86 percent above 1959, reducing yearend stocks nearly 71 percent.

**Lime.**—The total output of lime declined from 358,000 tons in 1959 to 345,000 tons, because of lower demand for refractory quicklime and lime for chemical, industrial, and construction uses. Although output of hydrated agricultural lime was the least of the major use categories, sales more than doubled those of 1959. Seven plants in California operated nine rotary kilns and three shaft-type kilns with a reported annual lime-burning capacity of 440,515 tons. Hydrators were usually continuous types. Fuel used at the plants were predominantly natural gas; however, several used fuel oil and one used coke. Some plants using natural gas maintained fuel oil on a standby basis. The Natividad operation in Monterey County was the largest lime-producing plant in the State. Other plants were operated in Alameda, El Dorado, San Bernadino, San Diego, and Tuolumne Counties. During 1960, the city of San Diego installed a 25-ton-per-day calcining plant at its Alvarado filtration facility. Lime used for water purification and softening was recovered from the sludge of treated water, the city's new and sole source. Lime produced in excess of needs was made available to the San Diego Miramar filtration plant.

**Lithium Minerals.**—The American Potash and Chemical Company extracted crude dilithium-sodium phosphate from brines in Searles Lake, San Bernardino County. The company converted the recovered product to lithium carbonate before it was marketed. Consumption and value increased slightly, compared with 1959, as wider uses for lithium and lithium chemicals were developed.

**Magnesite and Magnesium Compounds.**—The Western Quarry near Livermore continued to be the State's only active magnesite property. Although tonnages were comparatively small, production and shipments were more than five times the 1959 figures. Late in the year, operation of the deposit was assumed by Mother Lode Rock Industries, Inc. Production and sales of magnesium compounds declined from 1959. Magnesium carbonate led the decline with a 10-percent decrease in both quantity and value. The Mineral Products Division, Food Machinery Corp., plants in Alameda and San Diego Counties extracted mangnesium hydroxide and mangnesium chloride, respectively, from saltworks bitterns obtained from nearby salt producers. In Monterey and San Mateo Counties, extraction plants operated by Kaiser Aluminum and Chemical Corp. and Merck & Co., Inc., respectively, recovered magnesium compounds from sea water, using calcined dolomite and limestone.

**Mica.**—The State's entire production of crude mica (sericite schist) was obtained from a deposit near Ogilby, Imperial County. The output was ground by the producer and sold for use in manufacturing

Digitized by Google

roofing material. Crude scrap mica purchased from South Dakota and imported from India and Mexico was dry-ground at a Los Angeles County processing plant. The plant output was sold to paint and roofing material manufacturers.

**Perlite.**—Crude perlite output was limited to two operations—one each in Inyo and Napa Counties. The tonnage of crude perlite produced and sold declined slightly compared with 1959. Average unit values increased slightly. Twelve plants in California expanded perlite—7 in Los Angeles County, and 1 each in Contra Costa, Fresno, Marin, Napa, and San Diego Counties. More than half the crude perlite processed by expanding plants in California was supplied by out-of-State producers. Expanded perlite was sold for consumption in building plaster, wallboard, and paint products, and for use as loose-fill insulation, concrete aggregate, soil conditioner, filler, and filter aid.

**Potassium Salts.**—Although production of potassium compounds increased slightly compared with 1959, sales of potassium chloride and potassium sulfate declined 14 percent. The average unit value increased. Stocks were reduced appreciably below 1959. Except for the relatively small quantity of potassium sulfate contained in cement plant flue dust obtained near Davenport and used as a soil aid, the entire California production was extracted by American Potash and Chemical Corp. as muriate of potash (potassium chloride) at Trona, from Searles Lake brines. Some of the muriate was converted to potassium sulfate. The company reported expansion of its Trona operations as part of a $25 million capital improvement plan. A $7 million evaporation plant was under construction to replace obsolete borax, potash, soda ash, and salt cake producing units.

**Pumice.**—The tonnage of pumice, including pumicite and volcanic cinder, produced for sale or use, dropped from 574,000 tons in 1959 to 427,000 tons, chiefly because of a decline of 148,000 tons in the quantity of cinder and scoria used as railroad ballast. The tonnage of cinder consumed in road construction was substantially the same as

**TABLE 9.—Pumice[1] sold or used by producers in 1960, by counties**

| County | Crude | | Prepared | | Total | |
|---|---|---|---|---|---|---|
| | Short tons | Value | Short tons | Value | Short tons | Value |
| Fresno | 570 | $1,938 | 456 | $2,664 | 1,035 | $4,602 |

[2] Figure withheld to avoid disclosing individual company confidential data; included with "Other counties."
[3] Includes Imperial, Kern, Mono, San Bernardino Counties and counties indicated by footnote 2.

Digitized by Google

in 1959. Included in total output was 103,000 tons of pumice and cinder produced for use as concrete aggregate and nearly 20,000 tons marketed for use in landscape gardening. Lesser quantities of pumice and related volcanic materials were produced for a wide variety of uses such as carrier in pesticides, diluent in fumigants, soil conditioner, insulation, plaster aggregate, abrasive, oil and grease absorbent, cleaning compound, and filler in paints.

**Pyrite.**—The Mountain Copper Co. of California Iron Mountain (Hornet) mine, Shasta County, was the only pyrite producer. Production and sales decreased appreciably below 1959. The output was shipped to two chemical plants in Contra Costa County. Most of the pyrite cinder produced at these plants was sold for use in manufacturing quick-setting cements. A small quantity was used as a soil supplement.

**Salt.**—Production and shipments of salt from 11 plants in 7 counties rose 4 percent, compared with 1959. Most of the output was solar salt, harvested and processed in the San Francisco Bay area. Leslie Salt Co., the leading producer, operated four plants in the area and planned to harvest a first crop in 1961 from ponds in the San Pablo Bay area. Solar evaporation of sea water and brines, was the major method of salt production; however, a rock salt (halite) deposit in San Bernardino County contributed significantly to the total output. More than 50 percent of California's salt production was consumed in the State. The remainder was shipped to Nevada, Washington, Arizona, Oregon, Hawaii, several other States, various Pacific islands, and Canada and Mexico. The salt was used chiefly as a food preservative, in the manufacture of chlorine and caustic soda, and as a water softener. Other uses that required relatively small quantities were in manufacturing paper, ceramics, and rubber; in processing oils and metals; and for deicing roads and streets.

**Sand and Gravel.**—Despite a decline in residential construction, the quantity and value of sand and gravel output remained relatively high because of increased activity in commercial building and highway construction. Total value of these materials declined $1.4 million from the record high of $108.9 million established in 1959. Approximately 92 percent of the 87.7 million tons of sand and gravel produced

**TABLE 10.—Sand and gravel sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Sand | | Gravel | | Total | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 22,435 | $21,689 | 36,327 | $32,930 | 58,762 | $54,619 |
| 1956 | 30,564 | 35,492 | 55,883 | 61,034 | 86,447 | 96,526 |
| 1957 | 32,789 | 34,134 | 46,194 | 52,896 | 78,983 | 87,030 |
| 1958 | 30,810 | 34,710 | 53,327 | 60,630 | 84,137 | 95,340 |
| 1959 | 34,101 | 41,583 | 53,844 | 67,326 | 87,945 | 108,909 |
| 1960 | 36,524 | 46,000 | 51,155 | 61,503 | 87,679 | 107,503 |

Digitized by Google

was used for building and paving. Output of special industrial sands rose 15 percent above 1959; glass and molding sands increased the most. Production of ground sand declined mainly because a lower tonnage was prepared for foundry use. Los Angeles County again led in sand and gravel output by a wide margin, producing 18.8 million tons, 21 percent of the State total. Several large producers sought more favorable marketing positions during 1960 by acquiring existing commercial preparation plants and potential deposits.

[1] Includes Amador, Calaveras, San Francisco, San Mateo, Sierra, and Solano Counties, combined to avoid disclosing individual company confidential data.

**Slag (Iron-Blast Furnace).**—Kaiser Steel Corp. purchased North Hollywood Tile Co. in a long-range program aimed at productive use of the large quantity of blast-furnace slag generated at its Fontana steel plant. The slag will be expanded for lightweight aggregate. The new acquisition was to be operated as the North Hollywood Block Division, Kaiser Steel Corp.

**Sodium Compounds.**—Tonnage and value of sodium compounds increased 9 percent, compared with 1959. Pittsburgh Plate Glass Co., Chemical Division (formerly Columbia Southern Chemical Corp.) produced anhydrous sodium carbonate and sodium sesqui-carbonate from Owens Lake brines, Inyo County. U.S. Borax and Chemical Corp. produced anhydrous sodium sulfate in its Wilmington refinery, Los Angeles County, from borates mined and partly refined in Kern County. Stauffer Chemical Co. purchased borates from the same source and recovered byproduct sodium sulfate in its San Francisco plant. American Potash and Chemical Corp and West End Chemical Co. (Division, Stauffer Chemical Co.) recovered sodium carbonate (soda ash and trona) and sodium sulfate (salt cake) through processing Searles Lake brines in plants at Trona and West End, respectively. Glauber's salt also was produced at the latter plant.

**Stone.**—Stone production rose to 88.1 million tons, valued at $49.8 million, owing to the increased quantity of riprap material quarried for dam construction and road relocation, mostly in Tulare County. Although a record decline was reported in the production of limestone used in manufacturing cement, output of limestone and dolomite rose for such industrial uses as metallurgical flux, whiting, refractories,

[3] Less than 1,000 short tons.
[4] Included with "Other counties" to avoid disclosing individual company confidential data.
[5] Includes Calaveras, Kern, Marin, Monterey, Napa, San Benito, San Francisco, Stanislaus, an counties indicated by footnote 4.

Digitized by Google

poultry grit, filler in paper, and mineral feed for animals. The increased tonnages of road material quarried from sandstone and miscellaneous stone deposits offset to some extent the lower quantity of granitic rock produced for the same use. Marble quarry operators experienced a year of high demand for blocks and slabs for interior use and crushed marble for roofing, terrazzo, and exposed aggregate in precast panels. Dimension granite quarried for architectural stone and industrial purposes increased by nearly 10,000 cubic feet compared with 1959. Output gains also were noted in the volume of dimension limestone prepared for building, and of limestone and slate for flagging. The tonnage of natural and artificially colored roofing granules prepared from crushed stone and gravel during the year rose from 328,000 tons in 1959 to about 404,000 tons.

**TABLE 15.—Stone sold or used by producers, by kinds**

[Thousand short tons and thousand dollars]

| Year | Granite | | Basalt and related rocks (traprock) | | Limestone [1] | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1956 | 3,899 | $5,155 | 1,967 | $2,339 | 14,115 | $22,118 |
| 1957 | 12,744 | 10,565 | 1,953 | 2,432 | 14,102 | 22,512 |
| 1958 | 3,649 | 5,348 | 1,499 | 1,738 | 14,409 | 22,584 |
| 1959 | 4,343 | 5,433 | 1,772 | 2,728 | 16,137 | 24,384 |
| 1960 | 4,208 | 5,409 | 1,941 | 2,748 | 15,054 | 23,311 |

| Year | Sandstone | | Other stone [2] | | Total | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1956 | 2,618 | $4,834 | 9,684 | $11,662 | 32,583 | $46,108 |
| 1957 | 4,222 | 6,680 | 8,330 | 11,402 | 41,351 | 53,591 |
| 1958 | 3,933 | 5,688 | 8,933 | 12,987 | 32,423 | 48,345 |
| 1959 | 2,758 | 4,506 | 7,124 | 12,039 | 32,134 | 49,090 |
| 1960 | 3,541 | 5,626 | 8,331 | 12,748 | 33,075 | 49,842 |

[1] Includes limestone and oystershell used in cement and lime as follows (in thousand short tons and thousand dollars): 1956, 12,260 tons, $17,355; 1957, 11,861 tons, $16,489; 1958, 12,352 tons, $16,422; 1959, 13,663 tons, $16,628; 1960, 12,605 tons, $16,645.

[2] Includes light-colored volcanics, schist, serpentine, river boulders, and such other stone as cannot properly be classed in any main group; also marble (1956-60) and slate (1958-60).

**Sulfur.**—Recovery of elemental sulfur as a byproduct of oil refining increased 7 percent over 1959. Total production from all major California refineries reached 88,936 long tons. The Modified Claus or Simon-Carves method generally was used for elemental sulfur recovery at refineries concerned, most of which were in the Los Angeles area. Refineries producing hydrogen sulfide reported a 16 percent increase in output. Recovery from stack exhaust gases at the Selby smelter in Contra Costa County was 31 percent greater than in 1959.

Production and shipments of sulfur ore increased 15 and 19 percent, respectively, compared with 1959. A high percentage of the total output was mined at the Leviathan sulfur deposit, Alpine County, by The Anaconda Company. Four other mines, New Elgin, Colusa County; Crater Sulphur, Inyo County; and the S Bar S and Sulphur Bank, Lake County, yielded sulfur ores used to treat soils. Output

Digitized by Google

from the Leviathan mine was consumed in the producer's sulfuric acid plant in Nevada.

**Talc, Soapstone, and Pyrophyllite.**—Production and shipments of these minerals dropped 10 and 12 percent, respectively, below 1959 figures, and direct sales to consumers declined 7 percent. Approximately 87 percent of the combined outputs were mined from deposits in Inyo and San Bernardino Counties. These two counties were the source of all the talc produced. The soapstone production came principally from one deposit each in Amador, El Dorado, and Los Angeles Counties. Pyrophyllite was shipped mainly from one property each in Mono and San Bernardino Counties, and three in San Diego County. The ceramic industry consumed 50 percent of the total shipments. In descending order of quantity consumed, insecticides, paint, paper, rubber, toilet preparations, rice polishing, asphalt, and textiles used the remainder. Only talc was reported to have been exported.

**Vermiculite.**—California Zonolite Co. exfoliated crude vermiculite received from company mines in Montana at plants in Sacramento and Los Angeles Counties. In Orange County, Lahabralite Co. exfoliated crude vermiculite imported from Africa. The plant products were used principally for thermal and acoustical insulation, and as lightweight aggregate in plaster and concrete; however, some of the plant output was sold for use by nurseries for rooting cuttings and tubers, sprouting seedlings, and as a soil conditioner. The quantity of vermiculite exfoliated was virtually unchanged from 1959, but unit values rose appreciably owing to increased sales for specialized uses.

**Water.**—Pacific Gas and Electric Co. constructed and placed in service the first geothermal-electric power generating station in North America. The Geysers Tower Plant, Sonoma County, had a capacity of 12,500 kilowatts. Source of its power is natural steam recovered through a series of wells that provide the plant with 348° F. steam at the rate of 265,000 pounds an hour. Adequate steam has been developed to permit constructing a second plant of similar capacity.

Possible sources of geothermal power for generating electricity were investigated by the Magma Power Co. at Casa Diablo Hot Springs, Mono County, northwest of Bishop, and in the Sulphur Bank area, Lake County. A geothermal area in Napa County was explored by the Calistoga Power Co.

Westinghouse Electric Corp. was awarded the contract for constructing a 1 million gallon-per-day sea water conversion demonstration plant at Point Loma, San Diego County. The plant represented a cooperative effort of the Office of Saline Water, U.S. Department of the Interior, and the State of California Department of Water Resources, and was expected to produce fresh water for about $1 per thousand gallons. It will use a multistage flash distillation process incorporating several features designed to permit flexibility for testing and for further improvements in economy.

The Southern California Edison Co. completed an experimental sea-water conversion plant near Oxnard, Ventura County. The pilot plant consisted of a 26-stage flash evaporation unit that used nearly spent steam from the generating station turbines. It will supply technical and cost data for use in designing larger scale commercial units.

**Other Nonmetals.**—Some exploratory and assessment work was done at the Desert Rat claims, an aluminum silicate (abrasives) prospect a few miles southeast of Daggett, San Bernardino County, on the Camp Rock road. An amorphous silica property in the Castle Mountains southeast of Ivanpah was idle throughout the year.

Sunray Mid-Continent Oil Co. carried out an extensive exploratory program in a relatively unexplored section of the Mojave Desert. The intensive search included core drilling in an attempt to find commercial saline deposits and other minerals. A laboratory trailer, equipped to conduct wet chemical analysis and with a petrographic microscope and a Geiger counter, accompanied the specially adapted shorthole drill-rig. The results of this search had not been reported at yearend.

C. K. Williams Co., the only producer of iron oxide pigments in California, operated a plant at Emeryville, Alameda County. Most of the output was manufactured brown, red, and yellow iron oxides made from steel scrap, using acids and caustics; however, small tonnages of hematite from Arizona and limonite from Oregon were used to produce natural brown iron oxide, venetian red, and ocher pigments.

No strontium minerals were produced. The Pan Chemical Co. celestite property in the Fish Creek Mountains, San Diego County, was idle throughout 1960; it had reported production in 1959.

Several California chemical companies purchased phosphate rock from out-of-State producers and used the mineral chiefly in manufacturing various grades of fertilizers.

Wollastonite float was gathered near Midland, Riverside County, and shipped for use as ornamental and building stone.

## METALS

**Beryllium.**—The Sorenson beryllium prospect in the Inyo Mountains, about 8 miles east of Lone Pine, Inyo County, was investigated by the Bureau of Mines to obtain information on the beryllium mineralization in the area. The Bureau excavated 1,000 feet of trenches and took 200 channel samples. Results of this work indicated that beryl occurred disseminated and in widely separated, discontinuous, narrow stringers. The White Caps Gold Mining Co. of Nevada obtained a lease and option to purchase the property. The company continued the investigations by core drilling and underground exploration.

**Chromite.**—No chromite ore was mined or shipped in 1960. Chromite was eligible for Government assistance under the OME program, but the lack of a market for domestic ore discouraged exploration or development at California mines.

**Copper.**—The output of recoverable copper was the highest since 1947 and had the greatest total value since that date except for 1956. This high quantity and value resulted because the metal-mining industry was strike-free and the unit price for the metal averaged 32.1 cents per pound for 1960. Three mines yielded 94 percent of the near-record production. The major producer was Union Carbide Nuclear Co. at its Pine Creek mine (byproduct copper from tungsten ore),

Digitized by Google

Inyo County; followed by Celtor Chemical Corp. at its Copper Bluff mine (copper ore), Humboldt County; and Mountain Copper Co. at its Iron Mountain mine (copper precipitates from mine water of a pyrite ore-body), Shasta County. Although 11 other properties contributed to the total copper output, only 3 mines (copper), 1 each in Madera, Plumas, and Siskiyou Counties yielded more than 10 tons of recoverable metal.

**TABLE 16.—Mine production of gold, silver, copper, lead, and zinc in 1960, by counties, in terms of recoverable metals**

| County | Mines producing [1] | | Gold (lode and placer) | | Silver (lode and placer) | |
|---|---|---|---|---|---|---|
| | Lode | Placer | Troy ounces | Value | Troy ounces | Value |
| Alpine | 1 | | 78 | $2,730 | 3,182 | $2,880 |
| Amador | 3 | 1 | 74 | 2,590 | 21 | 19 |
| Butte | 2 | 2 | 57 | 1,995 | 18 | 16 |
| Calaveras | 1 | (2) | 30 | 1,050 | 8 | 8 |

**Gold.**—Total recoverable gold produced was 15 percent below the 1959 figure. The decline was most pronounced in placer operations, in which 3.5 million cubic yards less material was washed. One of the two major placer gold operations treated 45 percent less material; the other washed about the same quantity as in 1959. There were eight more active placer properties in 1960, seven of which were dragline operations.

Approximately 10,000 less ounces of gold was obtained from lode gold ores, but increased activity at copper, lead, and zinc mines that recovered gold as a byproduct more than offset that loss.

**Iron Ore.**—Less iron ore was mined than in 1959. Only one mine produced direct-shipping-grade ore, and only three mines were active. Shipments of usable iron ore were 8 percent above 1959, and the entire increase was credited to exported concentrate. Concentrate was produced only at the Eagle Mountain mine, Riverside County, and the Iron Age mine, San Bernardino County. Neither property yielded direct-shipping-grade ore. The Rusty Ridge open-pit iron mine near Paradise, Butte County, explored in 1959 by Standard Slag Co., yielded direct-shipping-grade ore in 1960 that was shipped for export. The company reported that economic grades of ore were exhausted in November, and the mine was abandoned. The blast furnaces of Kaiser Steel Corp., Fontana, consumed most of the Eagle Mountain output and iron ore from Nevada mines. Approximately one-third of the concentrate produced from Iron Age ore, by hand-sorting and magnetic separation, was sold for use in cement; the remaining tonnage was consumed in open-hearth furnaces. The Port of Stockton received 678,710 long tons of iron ore from California and Nevada producers for export to Japan.

**Iron and Steel.**—Production, shipments, and consumption of pig iron rose 24, 21, and 20 percent, respectively, above 1959 figures. Although California pig iron was produced only at the Kaiser Steel Corp. integrated steel plant in Fontana, Columbia-Geneva Division, U.S. Steel Corp., received pig iron at its Pittsburg works in Contra Costa County and its Torrance works, Los Angeles County, from company blast furnaces in Utah. At Niles, Pacific States Steel Corp. completed new fabricating facilities in July but the planned completion of a blast furnace was delayed until mid-1962 or later. Bethlehem Steel Corp. completed an H-iron plant at Los Angeles for direct reduction of iron ore. The plant operated experimentally late in the year, but results of the test runs were not available at yearend. The American Steel Rolling Mills, Inc., in Long Beach, was acquired by Texas interests. The new owner planned early completion of an automated plant to make reinforcing rod and expected to be in operation early in 1961. The New Pacific Rolling Mills, Inc., placed the West Coast's first stainless-steel plant in production at Cucamonga. Design capacity of this plant was 150,000 tons of rolled steel (bars, squares, flats, channel, and angles) per year. During the year National Steel Supply at Torrance added an experimental furnace for extremely high-temperature work.

[1] For historical data by years, see Minerals Yearbook, Review of 1940, p. 219.
[2] Excludes itinerant prospectors, "snipers," "high-graders," and others who gave no evidence of legal right to property.
[3] Includes commercial rock plants and tungsten mines that produced byproduct gold from gravels; byproduct gold is included with gold recovered, but material treated and average value per cubic yard refer only to straight gold dredging.
[4] Less than 1,000 cubic yards.
[5] Includes all placer operations using power excavator and washing plants both on dry land; when the washing plant is a movable outfit, it is termed "dry-land dredge."
[6] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long tons.
[7] Includes gold recovered by electrostatic separation; combined to avoid disclosing individual company confidential data.
[8] Revised figure.
[9] Data not available.

**TABLE 20.—Mine production of gold, silver, copper, lead, and zinc in 1960, by classes of ore or other source materials in terms of recoverable metals**

| Source | Number of mines [1] | Material sold or treated (short tons) | Gold (troy ounces) | Silver (troy ounces) | Copper (pounds) | Lead (pounds) | Zinc (pounds) |
|---|---|---|---|---|---|---|---|
| Lode ore: | | | | | | | |
| Gold | 53 | 133,875 | 27,559 | 29,384 | 500 | 5,100 | 1,700 |
| Silver | 3 | 177 | 78 | 3,700 | ---------- | 200 | 200 |
| Copper and tungsten ore [2] | 14 | [3] 17,292 | 3,418 | 105,769 | 2,001,900 | 24,500 | 621,500 |
| Lead | 10 | 2,294 | 20 | 13,355 | 800 | 285,000 | 7,000 |
| Lead-zinc | 2 | 3,087 | 29 | 18,484 | 10,800 | 562,000 | 299,600 |
| Total | 82 | 156,725 | 31,104 | 170,692 | 2,014,000 | 876,800 | 930,000 |
| Other lode material: | | | | | | | |
| Copper precipitates | 1 | 158 | 71 | 2,907 | 160,000 | 3,200 | ---------- |
| Old tailings | (4) | 398 | 359 | 572 | ---------- | ---------- | ---------- |
| Total | 1 | 556 | 430 | 3,479 | 160,000 | 3,200 | ---------- |
| Total lode material | 83 | 157,281 | 31,534 | 174,171 | 2,174,000 | 880,000 | 930,000 |
| Gravel (placer operations) | 50 | (5) | 92,179 | 5,609 | ---------- | ---------- | ---------- |
| Total all sources | 133 | ---------- | 123,713 | 179,780 | 2,174,000 | 880,000 | 930,000 |

[1] Detail will not necessarily add to total, because some mines produce more than one class of material.
[2] Combined to avoid disclosing individual company confidential data.
[3] Tungsten-ore tonnage not included.
[4] From property not classed as a mine.
[5] 21,200,670 cubic yards. Does not include material washed at commercial gravel plants to produce 278 ounces of byproduct gold and 21 ounces of byproduct silver included in placer totals.

**Iron and Steel Scrap.**—Consumption of ferrous scrap in California dropped 10 percent below 1959; in contrast, pig iron consumption rose 20 percent. Except for the Fontana plant of Kaiser Steel Corp., California steel mills used scrap (home-generated and purchased) for 80 to 100 percent of their iron requirements. Home-generated ferrous scrap increased 11 percent over 1959 to 1,194,690 short tons, whereas purchased scrap declined 32 percent to 1,043,720 short tons. Exports were high for the year, particularly for the 4th quarter when Japanese interests contracted for 95 cargoes of iron and steel scrap. This was 30 cargoes above the previous quarter and the highest for any 3-month period since export was opened in 1953. Los Angeles No. 1 heavy-melting scrap closed the year at $29 to $30 per long ton; San Francisco, at $32. No. 2 bundles, the major product at most scrap yards, closed at $17 per long ton in Los Angeles and $18, in San Francisco.

**TABLE 21.—Ferrous scrap and pig iron consumption**

(Thousand short tons)

| Year | Ferrous scrap | Pig iron | Year | Ferrous scrap | Pig iron |
|---|---|---|---|---|---|
| 1951-55 (average) | 2,529 | 1,203 | 1958 | 2,127 | 1,280 |
| 1956 | 2,789 | 1,431 | 1959 | 2,280 | 1,379 |

**TABLE 22.—Ferrous scrap and pig iron, consumption by types of furnaces and miscellaneous uses**

(Thousand short tons)

| | 1959 | 1960 | | 1959 | 1960 |
|---|---|---|---|---|---|
| Ferrous scrap and pig iron charged to— | | | Ferrous scrap and pig iron charged to— | | |
| Steel furnaces: [1] | | | Miscellaneous uses: [3] | | |
| Scrap | 1,868 | 1,670 | Scrap | 53 | 47 |
| Pig iron | 1,171 | 1,340 | | | |
| | | | Total scrap | 2,280 | 2,054 |
| Total | 3,039 | 3,010 | Total pig iron | 1,379 | 1,650 |
| Iron furnaces: [2] | | | Grand total | 3,659 | 3,704 |
| Scrap | 359 | 337 | | | |
| Pig iron | 208 | 310 | | | |
| Total | 567 | 647 | | | |

[1] Includes open-hearth, electric furnaces, and basic oxygen process.
[2] Includes cupola, air, and blast furnaces; also direct castings.
[3] Includes rerolling, copper precipitation, nonferrous, and chemical uses.

**Lead.**—The output of recoverable lead nearly doubled that of 1959. Lead and lead-zinc ores mined in Inyo County, principally at the Defense (lead) and the Santa Rosa (lead-zinc) mines in the Modoc and Lee districts, respectively, furnished 87 percent of the increase. Of the total recoverable lead produced, less than 4 percent was derived from sources other than lead and lead-zinc ores.

**Manganese.**—Ore shipments were limited to low-grade manganese ores obtained from two mines in Stanislaus County and one in Tehama County. All shipments were consigned to an Arizona mill for upgrading. Ultimate consumption, as concentrate, was in iron and steel.

**Mercury.**—Activity at mercury mines increased compared with 1959, despite a lower average unit price for the metal. The tonnages of ore mined and treated rose more than 4 percent above 1959, and production and shipments were up 10 and 9 percent, respectively. Although 56 operators at 41 properties contributed to the total, over 82 percent of the output came from three operations—the New Idria mine, San Benito County; the Mt. Jackson, Sonoma County; and the Buena Vista, San Luis Obispo County. Six mines—one each in Kings, Lake, Santa Barbara, and Sonoma Counties, and two in Santa Clara County—produced 200 or more flasks. The remaining 32 mines and prospects yielded less than 200 flasks each.

**TABLE 23.—Mercury production, by methods of recovery**

| Year | Operating mines | Furnaced [1] | | Retorted | | Unclassified [2] flasks | Total | |
|---|---|---|---|---|---|---|---|---|
| | | Ore (short tons) | Flasks | Ore (short tons) | Flasks | | Flasks | Value [3] |
| 1951–55 (average) | 33 | 93,091 | 7,780 | 4,063 | 503 | 107 | 8,390 | $1,995,895 |
| 1956 | 71 | 76,801 | 6,991 | 9,312 | 1,971 | 55 | 9,017 | 2,343,699 |
| 1957 | 57 | 115,134 | 13,722 | 10,806 | 2,228 | 561 | 16,511 | 4,077,887 |
| 1958 | 48 | 130,560 | 20,307 | 10,471 | 1,594 | 464 | 22,365 | 5,122,927 |
| 1959 | 37 | 107,072 | 15,685 | 12,034 | 1,271 | 144 | 17,100 | 3,889,908 |
| 1960 | 41 | 120,714 | 17,862 | 4,334 | 785 | 117 | 18,764 | 3,954,701 |

[1] Includes ore and mercury from dumps not separable.
[2] Includes mercury recovered from miscellaneous dump material, placer, and cleanup operations.
[3] Value calculated at average New York price.

Digitized by Google

**Molybdenum.**—Production and shipments of molybdenite and powellite (combined) concentrates decreased 52 and 43 percent, respectively, below 1959. Both minerals were obtained as byproducts in the treatment of tungsten ores of the Pine Creek mine, Inyo County. All the molybdenite produced and about 10 percent of the molybdenum recovered as powellite was shipped for export. The remaining molybdenum recovered from powellite was sold for domestic consumption. Shipments were 46 percent above 1959, and yearend stocks were reduced about 68 percent.

**Platinum-Group Metals.**—Two major dredging operations, on the American and Yuba Rivers in Sacramento and Yuba Counties, respectively, obtained platinum as a byproduct in gold recovery.

**Rare-Earth Minerals.**—The Molybdenum Corp. of America Mountain Pass barite-bastnasite mine in the Ivanpah Mountains, San Bernardino County, was active during the year. The extensive deposit was further explored by churndrilling, and the open pit was developed by stripping. Production of bastnasite concentrate, averaging 68 percent rare-earth oxides, declined slightly from 1959, but shipments were more than three times those of 1959. The concentrate was processed at company plants in Washington and York, Pa. The Desert Dominion Mining and Milling Co. xenotime property in northern Riverside County was idle.

**Secondary Nonferrous Metals.**—An estimated 300 million pounds of nonferrous scrap valued at $30 million was consumed in California, a slight decline from the 1959 consumption. Lead, copper, and aluminum scrap comprised 85 percent of the total consumption, or 44, 27, and 14 percent, respectively; the remaining 15 percent included zinc, antimony, magnesium, nickel, and tin. In 1960 California rated as a "plus" area with respect to aluminum, copper, and lead scrap, and a "minus" area with respect to zinc scrap.

Plants in the Los Angeles area used most of the nonferrous scrap produced in consuming an estimated 85 percent of the copper and lead, and 97 percent of the aluminum scrap.

**Silver.**—The 4-percent increase in silver output over 1959 was due chiefly to increased activity at lead and lead-zinc mines from which silver ores was recovered as a byproduct. Placer silver production represented only 3 percent of the total and was recovered as a coproduct in placer gold mining. Approximately 76 percent of the lode silver was derived from copper ores mined in Humboldt and Siskiyou Counties, and tungsten, lead, and lead-zinc ores mined in Inyo County.

**Tungsten.**—Four tungsten mines were active. The Pine Creek mine and mill, Inyo County, of Union Carbide Nuclear Co. was the major tungsten operation in the State. Late in 1959 the company added additional processing steps that resulted in production of high-purity ammonium paratungstate in 1960. New Idria Mining and Chemical Co. reactivated its Strawberry mine in Madera County, and operated about 3 months for rehabilitation. The concentrate produced was sold mostly to a New York buyer; a relatively small quantity was purchased by Union Carbide Nuclear Co. for its Pine Creek plant. The other two operators of tungsten properties, the Nichols mine in Inyo County and the Little Dutchman in Fresno County, also sold concen-

Digitized by Google

trates to the Pine Creek operation. The Atolia tungsten mine, San Bernardino County, was inactive but stockpiled concentrate was sold to a New Jersey buyer. Late in the year, tungsten placer ground in the Atolia area was acquired by Metals and Petroleum Corp., Los Angeles.

**Uranium.**—Commercial uranium ore was shipped from two properties, one each in Lassen and Sierra Counties. The tonnage shipped was 19 percent below that in 1959, but the average $U_3O_8$ content was higher, and the total value remained substantially the same. The Lassen County ore was processed in Utah; the Sierra County ore was consigned to an Oregon plant.

**Zinc.**—Recoverable zinc output increased nearly sixfold over that in 1959. Most of the increase was credited to byproduct recovery from copper ore of the Copper Bluff mine, Humboldt County; however, production at the Santa Rosa mine, Inyo County, was more than double that in 1959. Copper and lead-zinc ores were the source of 99 percent of the total zinc output. Lead, tungsten, gold, and silver ores combined furnished the remaining 1 percent.

**Other Metals.**—Activity at cobalt-nickel properties and prospects was confined principally to routine assessment and maintenance work. A limited drilling program was completed by the Federal Bureau of Mines at the Diamond Flat and Pine Flat prospects near Smith River, Del Norte County, and considerable sampling, blasting, and road work was completed at claims in the Coyote Mountains, Imperial County. Some exploratory work was done on the Friday property near Julian, San Diego County.

Except for assessment work completed at the Live Oak mine near Saugus, Los Angeles County, and the Chloride-Globe group of claims near Warren, Inyo County, chromite-ruile prospects were idle.

A [illegible] prospect a few miles north of Mojave, Kern County, was idle except for annual assessment work. A Sacramento minerals company completed limited drilling programs in Amador, Butte, Calaveras, Mariposa, Merced, and Placer Counties in a search for [illegible] gold and other heavy minerals. Another [illegible] in the Barstow area, San Bernardino County, [illegible] from placer black sands. Recovery would [illegible] operation, using water not presently [illegible]

No [illegible] was produced in 1960 from the Santa Ana [illegible] Orange County.

Pits in the Irvington, Livermore, and Sunol areas and a sand dredge operation near Alameda were additional sources of sand and gravel. Nearly 500,000 tons of crushed basalt was quarried by Gallagher & Burk, Inc., at its Leona operation near Mountain Boulevard, Oakland, and used principally for road base and fill. Sandstone and miscellaneous stone were produced from quarries in the San Leandro and Hayward areas for the same uses by Castro Valley Rock Co., East Bay Excavating Co., Inc., La Vista Quarries, and San Leandro Rock Co. Lowrie Paving Co. mined fire clay for foundry use at the underground workings of the Tesla deposit near Livermore until the end of July, when the operation was shut down indefinitely. Miscellaneous clay was dug from a deposit 3 miles west of Livermore by E. H. Metcalf Materials, from open pits near Fremont by California Pottery Co. and Interlocking Roof Tile Co., and from the workings of Kraftile Co. 2 miles from Niles on the Niles-Alvarado road. The clays were sold or used for stoneware, heavy clay products, and architectural terra cotta.

**TABLE 24.—Value of mineral production in California, by counties**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Alameda | $20,527,931 | $19,720,317 | Sand and gravel, salt magnesium compounds, stone, lime, bromine, clays, gem stones. |
| Alpine | (1) | (1) | Sulfur ore, sand and gravel, silver, gold, stone, zinc, lead. |
| Amador | 1,396,203 | 1,656,175 | Sand and gravel, coal (lignite), clays, stone, soapstone, gold, silver. |
| Butte | [2] 3,277,509 | 4,945,328 | Natural gas, sand and gravel, stone, iron ore, gold, zinc, gem stones, silver, lead. |
| Calaveras | 15,094,715 | 13,583,617 | Cement, stone, sand and gravel, clays, gold, gem stones, silver. |
| Colusa | [2] 1,646,107 | 2,716,275 | Natural gas, sand and gravel, sulfur ore. |
| Contra Costa | [2] 3,694,333 | 3,654,402 | Stone, natural gas, peat, sand and gravel, clays. |
| Del Norte | 410,731 | 248,870 | Sand and gravel, stone, copper, silver. |
| El Dorado | 3,148,051 | 1,991,850 | Stone, lime, sand and gravel, soapstone, gem stones, gold, lead, silver, zinc. |
| Fresno | [2] 97,445,828 | 88,206,896 | Petroleum, natural gas, natural gas liquids, sand and gravel, stone, clays, gold, tungsten, pumice, mercury, asbestos, silver. |
| Glenn | [2] 8,397,127 | 8,500,622 | Natural gas, sand and gravel, stone. |
| Humboldt | [2] 1,734,595 | 2,565,884 | Sand and gravel, copper, natural gas, stone, gold, zinc, silver, lead, gem stones. |
| Imperial | [2] 3,368,440 | 2,302,673 | Gypsum, sand and gravel, pumice, stone, mica (scrap), gem stones. |
| Inyo | 8,710,106 | 10,956,725 | Tungsten, sodium carbonate, molybdenum, talc, pyrophyllite and soapstone, boron minerals, stone, copper, sand and gravel, pumice, pumicite and volcanic cinder, perlite, lead, silver, clays, zinc, sulfur ore, gold, gem stones. |
| Kern | [2] 343,221,896 | 350,477,295 | Petroleum, boron minerals, natural gas, natural-gas liquids, cement, stone, sand and gravel, gypsum, sodium sulfate, salt, clays, pumice, carbon dioxide, gold, gem stones, mercury, diatomite, barite, silver. |
| Kings | [2] 13,755,413 | 12,728,648 | Petroleum, natural-gas liquids, natural gas, sand and gravel, gypsum, mercury, stone. |
| Lake | 945,993 | 681,830 | Sand and gravel, mercury, pumice, pumicite and volcanic cinder, sulfur ore, stone, gem stones. |
| Lassen | 278,481 | 367,885 | Sand and gravel, stone, volcanic cinder, uranium, gem stones. |
| Los Angeles | [2] 243,342,097 | 236,758,913 | Petroleum, natural gas liquids, sand and gravel, natural gas, stone, cement, clays, iodine, soapstone, gold, gem stones, silver. |
| Madera | [2] 1,518,324 | 1,307,374 | Natural gas, stone, tungsten, pumice and pumicite, sand and gravel, copper, clays, gold, silver. |
| Marin | 1,478,499 | 2,006,568 | Stone, sand and gravel, clays, mercury, gem stones. |
| Mariposa | 158,926 | 169,745 | Sand and gravel, gold, stone, silver, gem stones. |
| Mendocino | 769,465 | 571,974 | Sand and gravel, stone, mercury, gem stones. |
| Merced | 1,387,326 | 1,201,528 | Sand and gravel, gypsum, gold, silver. |
| Modoc | 899,699 | 683,649 | Sand and gravel, peat, pumice and volcanic cinder, gem stones, stone. |

See footnotes at end of table.

**TABLE 24.—Value of mineral production in California, by counties—Continued**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Mono | $1,009,385 | $819,621 | Pumice and volcanic cinder, sand and gravel, pyrophyllite, clays, gold, lead, silver, gem stones. |
| Monterey | [2] 28,003,049 | 28,636,583 | Petroleum, magnesium compounds, lime, sand and gravel, stone, natural gas, feldspar, salt, gem stones. |
| Napa | 861,769 | 839,321 | Stone, sand and gravel, diatomite, mercury, asbestos, perlite, gem stones. |
| Nevada | 1,247,906 | 484,466 | Sand and gravel, gold, stone, barite, silver, lead, zinc, copper. |
| Orange | [2] 113,430,116 | 104,894,772 | Petroleum, natural gas liquids, natural gas, sand and gravel, clays, stone, salt, iodine, peat, gem stones. |
| Placer | 1,140,315 | 1,187,301 | Sand and gravel, clays, stone, gold, silver. |
| Plumas | 218,818 | 262,806 | Sand and gravel, stone, volcanic cinder, copper, gold, silver. |
| Riverside | [2] 37,408,359 | 36,692,145 | Iron ore, cement, sand and gravel, stone, clays, gypsum, peat, wollastonite, petroleum, gem stones, gold, copper, silver. |
| Sacramento | [2] 17,962,684 | 19,763,249 | Natural gas, sand and gravel, gold, clays, platinum, silver. |
| San Benito | [2] 8,624,419 | 8,116,650 | Cement, mercury, petroleum, stone, natural gas, sand and gravel, clays, gem stones. |
| San Bernardino | [2] 85,216,308 | 83,089,092 | Cement, boron minerals, sodium carbonate, stone, sodium sulfate, potassium salts, sand and gravel, salt, talc and pyrophyllite, lithium, clays, calcium chloride, lime, bromine, iron ore, petroleum, volcanic cinder, tungsten, rare earths, barite, natural gas, gem stones, silver, lead, fluorspar, copper, feldspar, gold, zinc, masonry cement. |
| San Diego | [2] 14,479,254 | 11,584,204 | Sand and gravel, stone, magnesium compounds, salt, lime, clays, pyrophyllite, gem stones, gold, silver. |
| San Francisco | 280,062 | [1] | Stone, sand and gravel. |
| San Joaquin | [2] 4,049,507 | 5,844,513 | Natural gas, sand and gravel, clays, stone. |
| San Luis Obispo | [2] 9,819,791 | 8,174,877 | Petroleum, stone, sand and gravel, natural-gas liquids, mercury, natural gas, gypsum, clays, gem stones. |
| San Mateo | [2] 13,142,472 | 11,683,004 | Cement, stone, salt, magnesium compounds, petroleum, clays, sand and gravel, natural gas. |
| Santa Barbara | [2] 89,876,893 | 90,098,632 | Petroleum, diatomite, natural gas, natural-gas liquids, sand and gravel, stone, mercury, gypsum, gem stones. |
| Santa Clara | [2] 29,425,051 | 27,226,555 | Cement, stone, sand and gravel, mercury, clays, magnesite, masonry cement, petroleum, gem stones. |
| Santa Cruz | 10,069,197 | 10,610,852 | Cement, stone, sand and gravel, clays, potassium salts. |
| Shasta | 2,137,663 | 2,242,136 | Sand and gravel, pyrites, copper, stone, gold, volcanic cinder, silver, lead. |
| Sierra | 979,641 | 771,051 | Gold, sand and gravel, stone, silver, uranium, zinc. |
| Siskiyou | 1,363,752 | 1,508,718 | Sand and gravel, pumice and volcanic cinder, gold, silver, copper, stone, gem stones. |
| Solano | [2] 9,178,305 | 11,974,518 | Natural gas, clays, stone, sand and gravel, petroleum, mercury. |
| Sonoma | [2] 2,676,569 | 3,073,831 | Sand and gravel, mercury, stone, natural gas, clays, gem stones. |
| Stanislaus | [2] 797,095 | 801,042 | Sand and gravel, clays, manganiferous ores, stone, gold, mercury, silver. |
| Sutter | [2] 690,532 | 698,533 | Natural gas, sand and gravel, clays, stone. |
| Tehama | [2] 611,063 | 1,356,970 | Sand and gravel, natural gas, stone, volcanic cinder, gem stones, manganiferous ores. |
| Trinity | 1,366,674 | 997,898 | Stone, sand and gravel, mercury, gold, volcanic cinder, silver. |
| Tulare | [2] 3,189,521 | 4,150,293 | Natural gas, sand and gravel, stone, barite, petroleum, clays, gem stones. |
| Tuolumne | 1,257,348 | 1,632,817 | Stone, lime, sand and gravel, gold, gem stones, silver. |
| Ventura | [2] 158,179,134 | 148,935,824 | Petroleum, natural gas, natural-gas liquids, sand and gravel, stone, clays, gypsum. |
| Yolo | [1] | [1] | Sand and gravel, natural gas, mercury. |
| Yuba | [2] 3,617,599 | 3,199,535 | Gold, sand and gravel, stone, clays, platinum, silver, copper. |
| Undistributed [3] | [2] 4,707,954 | 2,797,148 | |
| Total [4] | [2]1,433,626,000 | 1,402,214,000 | |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[2] Revised figure.
[3] Includes gem stones, gold, mercury, and silver that cannot be assigned to specific counties and value indicated by footnote 1.
[4] Total adjusted to eliminate duplicating value of clays and stone used in manufacturin cement and lime.

Digitized by Google

Crude salt was harvested from several thousand acres of ponds by solar evaporation, and washed and refined at four plants in the county. Leslie Salt Co. operated two plants at Newark, and one at Mt. Eden, and sold crude salt to another Newark refinery. Oliver Bros. Salt Co. also operated a plant at Mt. Eden. Salt-works bitterns from the Newark plants were piped to the nearby chemical plant of Mineral Products Division, Food Machinery Corp., and processed to yield magnesia, synthetic gypsum, and byproduct ethylene dibromide. Dolomite from the company quarry in San Benito County was burned and used to precipitate the magnesium hydroxide. Fibreboard Paper Products Corp. in Emeryville used purchased magnesium hydroxide for manufacturing insulation. The company also calcined crude gypsum from Nevada at Newark for use in wallboard and other gypsum products. At Berkeley, Philadelphia Quartz Co. used purchased magnesite and brucite in producing hydrous magnesium sulfate.

Judson Steel Corp. in Emeryville and Pacific States Steel Corp. in Union City operated open-hearth furnaces, using iron and steel scrap as the source of metal. The latter company's planned completion of a blast furnace was delayed until mid-1962, but new fabricating facilities were completed in July. Brush Beryllium Co. placed its new fabrication plant in operation at Hayward, using eastern beryllium metal to produce machined components for atmospheric and space vehicles and nuclear applications.

Custom grinding plants (nonmetallic minerals) were operated in Berkeley by Industrial Minerals & Chemical Co. and Yuba Milling Co., Division of Metals Disintegrating Co., Inc. The Chemical & Pigment Co. ground purchased metallic and nonmetallic minerals in Oakland. In Emeryville, C. K. Williams Co. produced synthetic and natural iron oxide pigments. Raw materials for the natural pigments were obtained from out-of-State sources.

**Alpine.**—A high percentage of the sulfur ore produced in California during 1960 was obtained from the Leviathan mine near Markleeville by The Anaconda Co. The crude ore was trucked to the producer's copper-leaching plant in Nevada and was used in making sulfuric acid. Virtually the entire sand and gravel and decomposed granite output was used by contractors for the U.S. Forest Service on agency roads or in constructing new sections of State Highway 89 near Picketts.

Claude B. Lovestedt worked the Zaca mine, 6 miles southeast of Markleeville, near Highway 89. The silver ore was shipped to the Selby smelter, Contra Costa County, for recovery of silver, gold, and lead. Some recoverable zinc was contained in the ore. About 485 feet of tunnel was rehabilitated during the year, yielding 100 tons of development work.

**Amador.**—Sand produced near Ione by Owens-Illinois and Ione Clay & Sand Co. was used in glass, firebrick, and flue lining. Paving sand and gravel was produced by crews of the Amador County Road Department and by a contractor for the State on Highway 88. Harbison-Walker Refractories Co. worked the Custer quarry south of Ione for quartzite used in silica brick. More than 1,000 tons of dimension building stone and roofing granules was produced by Sierra

Digitized by Google

Madre Stone Co. from its quarry near Volcano. State highway maintenance crews mined granite for fill.

Lignite mined near Ione by American Lignite Products Co., Inc., was processed in the company's Buena Vista plant to recover montan wax and various byproducts. Fire clay was shipped from deposits in the Ione area and from stockpiles by Gladding, McBean & Co., Pacific Clay Products Co., Ione Clay & Sand Co., and Harbison-Walker Refractories Co. This last company planned to acquire the Winter clay pit 3 miles northwest of Ione, effective January 1, 1961. Most of the clays mined in the Ione area were used in refractories and heavy clay products, but one company sold clays for use in pottery, as a carrier in insecticides, and for filler uses. Soapstone mined on the Rancheria property, near Sutter Creek, by Industrial Minerals & Chemical Co. was ground in the producer's Sacramento County mill for consumption in insecticides and rubber.

Three lode gold prospects, two near Pioneer and one near Enterprise, were the sources of gold ore mined and treated to recover gold and silver. Cleanup operations at two gold properties, one each near Jackson and Pine Grove, yielded a few ounces of gold and silver. A relatively small quantity of gold was produced from bench gravel worked by hydraulic methods on the Lancha Plana placer claims in Jackson Valley.

**Butte.**—Although the number of producing dry-gas wells was virtually unchanged from 1959, gas production rose 29 percent. The number of proved productive areas increased slightly and all gas fields in the county except the Llano Seco field had increased output. The greatest percentage increase in production occurred at the Schohr Ranch field (three wells). The Wild Goose field was the fifth largest dry-gas producer in the State.

Increased quantities of sand and gravel were needed to meet requirements of public works projects conducted in preparation for constructing the Oroville Dam and for highway reconstruction and resurfacing near Gridley, Chico, and Oroville. Producers in the area reclaimed these materials from old dredge and hydraulic tailings and from stream bed gravels in Dry Creek and the Feather and Sacramento Rivers. Output was used mostly for structural and paving purposes. Basalt rock and miscellaneous stone were quarried and prepared by State and County road crews for highway maintenance.

The extensive exploration and development carried on by Standard Slag Co. in 1959 at the Rusty Ridge iron property in the Table Mountain area yielded more than 10,000 tons of shipping grade ore in 1960. The output was exported. The deposit proved to be a pocket that was exhausted of economic-grade ore during the year, and the mine was abandoned. Stream gravels near the junction of the south fork and middle fork of the Feather River yielded gold and silver. Gold ore from the Hungry Jack mine near Big Bend contained recoverable gold and silver. The Silver King & Queen lead-zinc claims in the Philbrook Reservoir area were the source of small quantities of gold, silver, lead, and zinc.

**Calaveras.**—General use, moderate heat, high-early-strength, and plastic cements were produced in the five-kiln wet-process plant of Calaveras Cement Co. at Kentucky House, south of San Andreas.

Digitized by Google

Bulk and bag shipments were made by truck and rail to California markets and to distributors in Nevada and Oregon. Considerable development was conducted at two quarries near San Andreas where the company obtained limestone used in cement. Rough dimension stone was quarried near Mokelumne Hill by Harley H. Kreth. Altaville Aggregates worked the Peirano quarry to produce roofing granules. County road crews obtained stone from the Amelia Meuli quarry near Vallecito and the Elma Clark quarry south of Wilseyville. State highway maintenance crews quarried decomposed granite for fill.

Silica sand was prepared for the glass industry by Pacific Clay Products Co. at Camanche; flotation was used to control the feldspar content. Sand and gravel was produced and prepared for building and paving at the Neilsen Gravel Plant, San Andreas, and by crews and contractors of the County and the U.S. Forest Service. The largest clay and shale operation in the county was southeast of San Andreas, where these materials were mined for use in portland cement. Fire clay and miscellaneous clay were hauled from stockpiles maintained by Pacific Clay Products Co. at its Camanche, Snyder (Buena Vista), and Valley Springs operations, and by California Pottery Co. from Valley Springs. The clays were used in manufacturing heavy clay products. Cleanup operations at placers in the Angels Camp and Campo Seco areas yielded a few ounces of gold and silver. Gold ore shipped from the Tom Smith prospect near Sheep Ranch contained recoverable gold and silver.

**Colusa.**—Dry-gas production rose 78 percent above 1959. Several new discoveries were made during the year: By Western Gulf Oil Co. (Buckeye field) on January 1, Universal Consolidated Oil Co. (new pool in Compton Landing field) on September 26, Cameron Oil Co. (Forbes pool in Grimes field) on January 11, Occidental Petroleum Corp. (Grimes West field) on December 5, and Gulf Oil Corp. (Kirk field) on October 18. The Grimes West field appeared to be the most productive of these discoveries with an initial flow on December 7 of 17,250,000 cubic feet. Total depth of the well was 8,263 feet with perforations at 7,645–7,656 feet. The productive zone was Upper Cretaceous sands. The Arbuckle field was the most active gasfield with 10 new well completions; Kirkwood had three new completions; Grimes, five and Buckeye, six.

Sand and gravel was produced principally by crews and contractors of the county highway agency and the California Division of Highways. The material was used in reconstructing and resurfacing roads in the Grimes, Maxwell, and Williams areas. Commercial concrete batch plants were operated in the Williams area by Goforth Bros. and Cortena Rock Products Co., who obtained sand and gravel from nearby pits, creek beds, and river bars. A small tonnage of sulfur ore was mined at a property near Wilbur Springs and was used as a soil-conditioner.

**Contra Costa.**—Basalt was obtained from the Tunnel Rock quarry near Orinda; sandstone and quartzite, from surface and underground workings near Richmond and Pacheco; and miscellaneous stone, from a large quarry near Clayton. Major producers of stone were Pacific Cement & Aggregates, Inc., and Henry J. Kaiser Co. in the Clayton

Digitized by Google

area, and Blake Bros. Co. in Richmond. Most of the stone was used for riprap, concrete aggregate, and road base material. Sand was dug from pits near Cowell and Antioch and dredged from San Francisco Bay, chiefly for building, paving, and railroad ballast. Clays were mined by Port Costa Brick Works and United Materials & Richmond Brick Co. in the Port Costa and Richmond areas, respectively, and used in manufacturing brick. Kaiser Gypsum Co. in Antioch calcined crude gypsum imported from Mexico for use in manufacturing various gypsum products. The crude mineral was also consumed as a retarder in portland cement and as a filler. In the same plant the company expanded crude perlite purchased from a Nevada producer.

One of the State's outstanding dry-gas finds was the McCulloch-Duarte No. 1 about one-half mile south of production in the Los Medanos field in a new fault block. Discovery was made between 3,890 and 4,235 feet with a calculated free flow of 170 million cubic feet. The initial measured flow was 7,900,000 cubic feet through ½-inch bean. Production came from sands of Eocene age. Petroleum coke from refineries at Avon and Rodeo increased substantially above 1959. At yearend, new hydrogen-treating facilities were under consideration at major company refineries. Recovery of hydrogen sulfide at these refineries increased 19 percent over 1959, and elemental sulfur production rose 18 percent. Peat dredging in the San Joaquin River delta yielded a relatively large tonnage of reed-sedge peat, about half of which was packaged and sold as a soil conditioner. The value was up 27 percent from 1959.

**Del Norte.**—Sand and gravel for building and paving was obtained from stream-bed deposits along the Smith and Klamath Rivers, and was prepared by crews and contractors for Government agencies for road construction and maintenance from sources in the same areas. Miscellaneous stone quarried near Crescent City and in other places in the county was used as riprap and roadstone in State and county projects.

A few tons of ore from the Hiouchi prospect in the Myrtle Creek area, east of Crescent City, contained small quantities of recoverable copper and silver.

**El Dorado.**—An appreciable quantity of granite was quarried and much of the output was used in the Upper American River Project of the Sacramento Municipal Utility District; however, road improvements on Highways 50 and 89 and in the Georgetown and Pilot Hill areas also required impressive tonnages. Limestone was produced at two surface and two underground operations for consumption in glass and lime manufacture, sugar refining, metallurgical processes, for concrete and asphalt aggregate, as a filler in fertilizer, and for whiting and roofing granules. California Rock & Gravel Co. quarried limestone near Cool. Diamond Springs Lime Co. produced quicklime and hydrated lime, using an oil-fired rotary kiln and continuous hydrator and stone from its Mountain and Diamond Springs quarries. The Mountain underground quarry near Auburn was mined by room and pillar. El Dorado Limestone Co. also worked an underground limestone quarry near Shingle Springs by shrinkage stoping. Dimension building stone was quarried southeast of Placerville by Sierra Placerite Corp. At its underground workings in Chili Bar, Placer-

Digitized by Google

ville Slate Products Co. mined a substantial tonnage of slate, which was crushed for granules or ground for rock flour. Mine development included about 200 feet of tunneling. Sand and gravel for building, paving, and fill was produced by commercial operators near Placerville and by crews and contractors for Government agencies. The quantity of lightweight aggregate required for construction projects, principally in the Lake Tahoe area, was obtained in neighboring California and Nevada Counties. Pacific Clay Products Co. mined soapstone at its Shrub deposit south of Shingle Springs and shipped the crude mineral to grinders in the San Francisco Bay area.

Cleanup at the Hazel Creek lode-gold mine near Pollock Pines yielded relatively small quantities of gold, silver, lead, and zinc. The Hazel Creek mill, burned early in 1959, was not rebuilt. Development was carried on at the Yellow Jacket gold property near Kelsey, but no production was reported. Prospectors recovered a few ounces of gold and silver from stream gravels along the American River.

**Fresno.**—Crude oil production declined 6 percent from 1959. In 1960, 18 dry holes with a total footage of 122,554 feet were drilled, compared with 25 dry holes and 202,755 feet in 1959. Although a new pool wildcat was brought in by Leda Petroleum on June 27 in the Guijarral Hills field, oil-well completions were comparatively few. At the southeast end of the Helm field, oil was obtained 1,700 feet west of the nearest producer at a depth of 6,853 feet with an initial flow of 144 barrels daily. The southeast Burrel area was extended 2,100 feet northeast when Arrowhead Exploration Co. completed two producers. Shell Oil Co. drilled 30 comparatively shallow holes on its leases in the Coalinga field emphasizing the increased trend toward developing heavy oil with the aid of bottom-hole heaters. Such heaters use electric heating elements to raise the temperature of oil adjacent to the hole walls and thus to increase flow.

Although oil zone natural gas production was down 8 percent, dry-gas output was more than double that of 1959. Socony Mobil Oil Co., Inc., processed wet gas in one plant at Burrel and one near Avenal. Wet gas also was processed in two plants at Coalinga, one each by Standard Oil Co. and Union Oil Co. Production from these four plants was down 30 percent in total natural gas liquids, but LP-gas output increased 24 percent. Union Oil Co. increased plant capacity for butane-propane mixture 7 percent during the year.

Sand and gravel was produced from pits near Coalinga, Fresno, Friant, Pinedale, and Sanger for structural and paving uses by commercial operators, and for maintenance of roads by crews and contractors for Government agencies. Paving requirements were lower than in 1959 as road construction and resurfacing operations were limited to relatively small projects near Mendota, Fresno, and Academy. Dimension stone for monumental use was quarried near Academy by Superior Academy Granite Co. Decomposed granite and miscellaneous stone obtained near Sanger were used as roadstone and fill. Maintenance crews of the U.S. Forest Service produced some stone for riprap. Miscellaneous clay was dug from deposits near Fresno and used in manufacturing heavy clay products by Craycroft Brick Co. The South Dome pumice deposit east of Friant yielded over 1,000 tons of the material for lightweight aggregate. In March,

Digitized by Google

Fresno Perlite Corp. began operating a new perlite-expanding plant to replace one that burned in 1958. Johns-Manville Corp., National Milling & Mining, and Union Carbide Nuclear Co. explored chrysotile asbestos deposits in the same general area northwest of Coalinga. The first two shipped small tonnages to company mills for testing; the third shipped to an out-of-State processing plant.

Several sand and gravel producers, who worked deposits by dragline along the San Joaquin River, recovered notable quantities of gold and silver. Old bricks from the furnace at the Archer mine northwest of Coalinga were furnaced at New Idria, San Benito County, to yield a few flasks of mercury.

Glenn.—Humble Oil Co. made a new gasfield discovery (Angel Slough) about 3½ miles east of Princeton. Initial flow was 2,350,000 cubic feet at 800 pounds pressure from a 13-foot interval between 2,383 and 2,396 feet. Total depth was 7,019 feet, and the hole was plugged at 3,710 feet. The well was completed on June 18. Five new wells were completed during the year. The Beehive Bend gasfield again was a leading producer in the State. Although the main area of this field had a production loss of 8 percent, output from the Willows area was up 84 percent compared with 1959. The total dry-gas yield for the county was 5 percent below 1959.

Nearly 144,000 tons of gravel was produced from the Wyo pit for use as railroad ballast by Southern Pacific Co. Commercial sand and gravel plants were operated near Orland by Mack Rock & Sand Corp. and Orland Sand & Gravel Co. Both companies worked the Stony Creek stream bed. The Willow Creek deposits were worked by Willows Ready Mix Sand & Gravel Co. and by County road maintenance crews. Miscellaneous stone was quarried and prepared for a road project by a contractor for the U.S. Army Corps of Engineers.

Humboldt.—Highway and bridge construction near Dyerville, Bridgeville, Weitchpec, and between Eureka and Fortuna, required large tonnages of stone and sand and gravel compared with 1959 demands for these materials. Virtually all the stone quarried was used for riprap in embankments. Sand and gravel was produced principally from stream-bed deposits along the Eel, Van Dusen, and Mad Rivers. Major commercial producers operated established preparation plants near Arcata and Fortuna. Permanente Cement Co. established a bulk-cement-distribution facility at Eureka to serve consumers from Garberville north into Oregon with cement shipped by rail from the company plant at Permanente.

A new gasfield discovery (Table Bluff) was made June 7 by Zephyr Oil Co. about 2 miles north of Loleta. Total depth was 5,652 feet; production came from the 62-foot interval immediately above bottom. Initial flow was only 800,000 cubic feet, but on June 19 the flow increased to 1,200,000 cubic feet at 1,500 to 1,800 pounds per square inch pressure through a one-eighth inch bean. Total gas production, chiefly from the Eureka gasfield, decreased 6 percent from 1959.

The Copper Bluff mine near Hoopa was the only active lode mine in the county. Celtor Chemical Corp. mined copper ore from this property and processed it in the company mill beginning in April. Concentrate was shipped to smelters in Montana, Washington, Idaho, and California. The Copper Bluff mine supplied a high percentage

Digitized by Google

of the State's recoverable zinc, in addition to important quantities of copper, gold, and silver and several tons of lead. At the mine the company carried on development that included longhole drilling, drifts, and raises, and resulted in more than 8,500 tons of stockpiled development rock. A token quantity of gold was recovered from a few thousand pounds of ore at a prospect near the Klamath River northeast of Orleans.

**Imperial.**—U.S. Gypsum Co. worked its multiple bench gypsum mine in the Fish Creek Mountains and hauled the crude mineral to the company's gypsum products plant in Plaster City.

Crews and contractors of State and county road agencies produced more than half the county sand and gravel output. Deposits along the New and Alamo Rivers near Brawley, El Centro, and Holtville supplied commercial plants with sand and gravel for aggregate used chiefly in building construction and irrigation systems. Basalt rock from the Navajo quarry near Coyote Wells was prepared for roofing granules. Granite produced at the Mt. Signal quarry and the Pilot Knob quarry (near Winterhaven) was used as riprap by the Imperial Irrigation District and the Bureau of Reclamation. Decomposed granite quarried near Plaster City was used in building streets and driveways.

Pumice mined near Calipatria was used as lightweight aggregate and for landscaping. An open-pit deposit near Ogilby yielded mica (sericite schist), which was ground by the producer for use in manufacturing roofing materials.

**Inyo.**—The Union Carbide Nuclear Co. Pine Creek operations were enlarged to permit production of ammonium paratungstate and as a result, the quantity and value of tungsten production increased over 1959. The Pine Creek tungsten ores yielded a high percentage of the tungsten, all of the molybdenum, and much of the lode gold and silver produced in California, and was the State's leading source of copper. The Augusta prospect in the Cerro Gordo area was the only copper property in the county that reported any activity during the year. Although eight lead and lead-zinc mines contributed to the lead and zinc production, the lead-zinc ore from the Santa Rosa mine southwest of Keeler and lead ore from the Defense mine east of Darwin supplied 96 percent of the lead output and nearly 99 percent of the zinc. The ores from these two mines also contained more than 27 percent of the silver recovered from all lode mines in the county.

The Chemical Division (formerly Columbia-Southern Chemical Corp.), Pittsburgh Plate Glass Co., recovered sodium compounds from brines of Owens Lake in a plant at Bartlett. Principal products of the processing plant were anhydrous sodium carbonate and sodium sesqui-carbonate. The Gold Hill and Sugar Loaf areas at the Panamint Range and the areas near Big Pine, Big Springs, Keeler, and Tecopa yielded 60 percent of the State's (nearly 18 percent of the Nation's) talc production and shipments. About 1,500 feet of exploratory diamond drilling was done on the Warm Springs (Big Talc) property at Gold Hill, California's leading talc producer. Some of the crude mineral was ground in plants at Laws and Keeler. The Death Valley talc property, west of Shoshone, was operated by Multi Mines, Inc., the first half of 1960 and by Kennedy Minerals Co., Inc.,

Digitized by Google

trates to the Pine Creek operation. The Atolia tungsten mine, San Bernardino County, was inactive but stockpiled concentrate was sold to a New Jersey buyer. Late in the year, tungsten placer ground in the Atolia area was acquired by Metals and Petroleum Corp., Los Angeles.

**Uranium.**—Commercial uranium ore was shipped from two properties, one each in Lassen and Sierra Counties. The tonnage shipped was 19 percent below that in 1959, but the average $U_3O_8$ content was higher, and the total value remained substantially the same. The Lassen County ore was processed in Utah; the Sierra County ore was consigned to an Oregon plant.

**Zinc.**—Recoverable zinc output increased nearly sixfold over that in 1959. Most of the increase was credited to byproduct recovery from copper ore of the Copper Bluff mine, Humboldt County; however, production at the Santa Rosa mine, Inyo County, was more than double that in 1959. Copper and lead-zinc ores were the source of 99 percent of the total zinc output. Lead, tungsten, gold, and silver ores combined furnished the remaining 1 percent.

**Other Metals.**—Activity at cobalt-nickel properties and prospects was confined principally to routine assessment and maintenance work. A limited drilling program was completed by the Federal Bureau of Mines at the Diamond Flat and Pine Flat prospects near Smith River, Del Norte County, and considerable sampling, blasting, and road work was completed at claims in the Coyote Mountains, Imperial County. Some exploratory work was done on the Friday property near Julian, San Diego County.

Except for assessment work completed at the Live Oak mine near Saugus, Los Angeles County, and the Chloride-Globe group of claims near Weaverville, Trinity County, ilmenite-rutile prospects were idle.

A zircon prospect a few miles north of Mojave, Kern County, was idle except for annual assessment work. A Sacramento minerals company completed limited drilling projects in Amador, Butte, Calaveras, Mariposa, Merced, and Placer Counties in a search for zircon, titanium minerals, gold, and other heavy minerals. Another company prospected in the Barstow area, San Bernardino County, where drilling and testing revealed free zircon in black sands. Recovery would require a dredging operation, using water not presently available.

No activity of any kind was reported in 1960 from the Santa Ana tin prospect in Trabuco Canyon, Orange County.

## REVIEW BY COUNTIES

**Alameda.**—Increased sand and gravel requirements for paving projects, particularly MacArthur Boulevard and Nimitz Freeway, offset to a large extent the reduction in sales of aggregate for building construction. The capacities of the major producers—Henry J. Kaiser Co., Pacific Cement & Aggregates, Inc., and Rhodes & Jamieson, Ltd.—were more than 1 million tons a year each. These companies worked alluvial deposits near Pleasanton, Fremont, and Niles. Concrete aggregate obtained near Pleasanton was used in the massive estuary tube under construction between Alameda and Oakland.

Digitized by Google

Pits in the Irvington, Livermore, and Sunol areas and a sand dredge operation near Alameda were additional sources of sand and gravel. Nearly 500,000 tons of crushed basalt was quarried by Gallagher & Burk, Inc., at its Leona operation near Mountain Boulevard, Oakland, and used principally for road base and fill. Sandstone and miscellaneous stone were produced from quarries in the San Leandro and Hayward areas for the same uses by Castro Valley Rock Co., East Bay Excavating Co., Inc., La Vista Quarries, and San Leandro Rock Co. Lowrie Paving Co. mined fire clay for foundry use at the underground workings of the Tesla deposit near Livermore until the end of July, when the operation was shut down indefinitely. Miscellaneous clay was dug from a deposit 3 miles west of Livermore by E. H. Metcalf Materials, from open pits near Fremont by California Pottery Co. and Interlocking Roof Tile Co., and from the workings of Kraftile Co. 2 miles from Niles on the Niles-Alvarado road. The clays were sold or used for stoneware, heavy clay products, and architectural terra cotta.

**TABLE 24.—Value of mineral production in California, by counties**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Alameda | $20,527,931 | $19,720,317 | Sand and gravel, salt magnesium compounds, stone, lime, bromine, clays, gem stones. |
| Alpine | (1) | (1) | Sulfur ore, sand and gravel, silver, gold, stone, zinc, lead. |
| Amador | 1,396,203 | 1,656,175 | Sand and gravel, coal (lignite), clays, stone, soapstone, gold, silver. |
| Butte | [2] 3,277,509 | 4,945,328 | Natural gas, sand and gravel, stone, iron ore, gold, zinc, gem stones, silver, lead. |
| Calaveras | 15,094,715 | 13,583,617 | Cement, stone, sand and gravel, clays, gold, gem stones, silver. |
| Colusa | [2] 1,646,107 | 2,716,275 | Natural gas, sand and gravel, sulfur ore. |
| Contra Costa | [2] 3,694,333 | 3,654,402 | Stone, natural gas, peat, sand and gravel, clays. |
| Del Norte | 410,731 | 248,870 | Sand and gravel, stone, copper, silver. |
| El Dorado | 3,148,051 | 1,991,850 | Stone, lime, sand and gravel, soapstone, gem stones, gold, lead, silver, zinc. |
| Fresno | [2] 97,445,828 | 88,206,896 | Petroleum, natural gas, natural gas liquids, sand and gravel, stone, clays, gold, tungsten, pumice, mercury, asbestos, silver. |
| Glenn | [2] 8,397,127 | 8,560,622 | Natural gas, sand and gravel, stone. |
| Humboldt | [2] 1,734,595 | 2,565,884 | Sand and gravel, copper, natural gas, stone, gold, zinc, silver, lead, gem stones. |
| Imperial | [2] 3,368,440 | 2,302,673 | Gypsum, sand and gravel, pumice, stone, mica (scrap), gem stones. |
| Inyo | 8,710,106 | 10,956,725 | Tungsten, sodium carbonate, molybdenum, talc, pyrophyllite and soapstone, boron minerals, stone, copper, sand and gravel, pumice, pumicite and volcanic cinder, perlite, lead, silver, clays, zinc, sulfur ore, gold, gem stones. |
| Kern | [2] 343,221,896 | 350,477,295 | Petroleum, boron minerals, natural gas, natural-gas liquids, cement, stone, sand and gravel, gypsum, sodium sulfate, salt, clays, pumice, carbon dioxide, gold, gem stones, mercury, diatomite, barite, silver. |
| Kings | [2] 13,755,413 | 12,728,648 | Petroleum, natural-gas liquids, natural gas, sand and gravel, gypsum, mercury, stone. |
| Lake | 945,993 | 681,830 | Sand and gravel, mercury, pumice, pumicite and volcanic cinder, sulfur ore, stone, gem stones. |
| Lassen | 278,481 | 367,885 | Sand and gravel, stone, volcanic cinder, uranium, gem stones. |
| Los Angeles | [2] 243,342,097 | 236,758,913 | Petroleum, natural gas liquids, sand and gravel, natural gas, stone, cement, clays, iodine, soapstone, gold, gem stones, silver. |
| Madera | [2] 1,518,324 | 1,307,374 | Natural gas, stone, tungsten, pumice and pumicite, sand and gravel, copper, clays, gold, silver. |
| Marin | 1,478,499 | 2,006,568 | Stone, sand and gravel, clays, mercury, gem stones. |
| Mariposa | 158,926 | 169,745 | Sand and gravel, gold, stone, silver, gem stones. |
| Mendocino | 769,465 | 571,974 | Sand and gravel, stone, mercury, gem stones. |
| Merced | 1,387,326 | 1,201,528 | Sand and gravel, gypsum, gold, silver. |
| Modoc | 899,699 | 683,649 | Sand and gravel, peat, pumice and volcanic cinder, gem stones, stone. |

See footnotes at end of table.

**TABLE 24.—Value of mineral production in California, by counties—Continued**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Mono | $1,009,385 | $819,621 | Pumice and volcanic cinder, sand and gravel, pyrophyllite, clays, gold, lead, silver, gem stones. |
| Monterey | [2] 28,003,049 | 28,636,563 | Petroleum, magnesium compounds, lime, sand and gravel, stone, natural gas, feldspar, salt, gem stones. |
| Napa | 861,769 | 839,321 | Stone, sand and gravel, diatomite, mercury, asbestos, perlite, gem stones. |
| Nevada | 1,247,906 | 484,466 | Sand and gravel, gold, stone, barite, silver, lead, zinc, copper. |
| Orange | [2] 113,430,116 | 104,894,772 | Petroleum, natural gas liquids, natural gas, sand and gravel, clays, stone, salt, iodine, peat, gem stones. |
| Placer | 1,140,313 | 1,157,301 | Sand and gravel, clays, stone, gold, silver. |
| Plumas | 218,519 | 261,806 | Sand and gravel, stone, volcanic cinder, copper, gold, silver. |
| Riverside | [2] 37,406,559 | 36,692,145 | Iron ore, cement, sand and gravel, stone, clays, gypsum, peat, wollastonite, petroleum, gem stones, gold, copper, silver. |
| Sacramento | [2] 17,962,684 | 19,763,249 | Natural gas, sand and gravel, gold, clays, platinum, silver. |
| San Benito | [2] 8,624,419 | 8,116,650 | Cement, mercury, petroleum, stone, natural gas, sand and gravel, clays, gem stones. |
| San Bernardino | [2] 55,216,308 | 53,089,392 | Cement, boron minerals, sodium carbonate, stone, sodium sulfate, potassium salts, sand and gravel, salt, talc and pyrophyllite, lithium, clays, calcium chloride, lime, bromine, iron ore, petroleum, volcanic cinder, tungsten, rare earths, barite, natural gas, gem stones, silver, lead, fluorspar, copper, feldspar, gold, zinc, masonry cement. |
| San Diego | [2] 14,479,254 | 11,584,304 | Sand and gravel, stone, magnesium compounds, salt, lime, clays, pyrophyllite, gem stones, gold, silver. |
| San Francisco | [2] [illegible] | [illegible] | Stone, sand and gravel. |
| San Joaquin | [2] 4,[illegible] | 5,844,573 | Natural gas, sand and gravel, clays, stone. |
| San Luis Obispo | [2] 8,[illegible] | 8,174,877 | Petroleum, stone, sand and gravel, natural-gas liquids, mercury, natural gas, gypsum, clays, gem stones. |
| San Mateo | [2] 13,142,472 | 11,683,304 | Cement, stone, salt, magnesium compounds, petroleum, clays, sand and gravel, natural gas. |
| Santa Barbara | [2] 89,578,983 | 90,098,632 | Petroleum, diatomite, natural gas, natural-gas liquids, sand and gravel, stone, mercury, gypsum, gem stones. |
| Santa Clara | [2] 29,425,351 | 27,226,533 | Cement, stone, sand and gravel, mercury, clays, magnesite, masonry cement, petroleum, gem stones. |
| Santa Cruz | 10,069,197 | 10,610,552 | Cement, stone, sand and gravel, clays, potassium salts. |
| Shasta | 2,137,983 | 2,242,136 | Sand and gravel, pyrites, copper, stone, gold, volcanic cinder, silver, lead. |
| Sierra | [illegible] | [illegible] | Gold, sand and gravel, stone, silver, uranium, zinc. |
| Siskiyou | 1,365,752 | 1,508,715 | Sand and gravel, pumice and volcanic cinder, gold, silver, copper, stone, gem stones. |
| Solano | [2] 9,175,305 | 11,974,515 | Natural gas, clays, stone, sand and gravel, petroleum, mercury. |
| Sonoma | [2] 2,575,389 | 3,173,431 | Sand and gravel, mercury, stone, natural gas, clays, gem stones. |
| Stanislaus | [2] 797,305 | 801,342 | Sand and gravel, clays, manganiferous ores, stone, gold, mercury, silver. |
| Sutter | [2] [illegible] | [illegible] | Natural gas, sand and gravel, clays, stone. |
| Tehama | [2] [illegible] | 1,536,470 | Sand and gravel, natural gas, stone, volcanic cinder, gem stones, manganiferous ores. |
| Trinity | 1,366,574 | 997,508 | Stone, sand and gravel, mercury, gold, volcanic cinder, silver. |
| Tulare | [2] 3,139,321 | 4,130,253 | Natural gas, sand and gravel, stone, barite, petroleum, clays, gem stones. |
| Tuolumne | 1,257,348 | 1,532,917 | Stone, lime, sand and gravel, gold, gem stones, silver. |
| Ventura | [2] 138,179,134 | 148,335,824 | Petroleum, natural gas, natural-gas liquids, sand and gravel, stone, clays, gypsum. |
| Yolo | [illegible] | [illegible] | Sand and gravel, natural gas, mercury. |
| Yuba | [2] 3,[illegible] | 3,198,535 | Gold, sand and gravel, stone, clays, platinum, silver, copper. |
| Undistributed [3] | [2] 4,[illegible] | 2,[illegible] | |
| Total [4] | [illegible] | [illegible] | |

[1] Figures withheld to avoid disclosing individual company confidential data; included with "Undistributed".
[2] Revised figure.
[3] Includes gem stones, gold, mercury, and silver that cannot be assigned to specific counties and value indicated [illegible].
[4] Data adjusted to eliminate duplicating value of clays and stone used in manufacture cement and lime.

Digitized by Google

Crude salt was harvested from several thousand acres of ponds by solar evaporation, and washed and refined at four plants in the county. Leslie Salt Co. operated two plants at Newark, and one at Mt. Eden, and sold crude salt to another Newark refinery. Oliver Bros. Salt Co. also operated a plant at Mt. Eden. Salt-works bitterns from the Newark plants were piped to the nearby chemical plant of Mineral Products Division, Food Machinery Corp., and processed to yield magnesia, synthetic gypsum, and byproduct ethylene dibromide. Dolomite from the company quarry in San Benito County was burned and used to precipitate the magnesium hydroxide. Fibreboard Paper Products Corp. in Emeryville used purchased magnesium hydroxide for manufacturing insulation. The company also calcined crude gypsum from Nevada at Newark for use in wallboard and other gypsum products. At Berkeley, Philadelphia Quartz Co. used purchased magnesite and brucite in producing hydrous magnesium sulfate.

Judson Steel Corp. in Emeryville and Pacific States Steel Corp. in Union City operated open-hearth furnaces, using iron and steel scrap as the source of metal. The latter company's planned completion of a blast furnace was delayed until mid-1962, but new fabricating facilities were completed in July. Brush Beryllium Co. placed its new fabrication plant in operation at Hayward, using eastern beryllium metal to produce machined components for atmospheric and space vehicles and nuclear applications.

Custom grinding plants (nonmetallic minerals) were operated in Berkeley by Industrial Minerals & Chemical Co. and Yuba Milling Co., Division of Metals Disintegrating Co., Inc. The Chemical & Pigment Co. ground purchased metallic and nonmetallic minerals in Oakland. In Emeryville, C. K. Williams Co. produced synthetic and natural iron oxide pigments. Raw materials for the natural pigments were obtained from out-of-State sources.

**Alpine.**—A high percentage of the sulfur ore produced in California during 1960 was obtained from the Leviathan mine near Markleeville by The Anaconda Co. The crude ore was trucked to the producer's copper-leaching plant in Nevada and was used in making sulfuric acid. Virtually the entire sand and gravel and decomposed granite output was used by contractors for the U.S. Forest Service on agency roads or in constructing new sections of State Highway 89 near Picketts.

Claude B. Lovestedt worked the Zaca mine, 6 miles southeast of Markleeville, near Highway 89. The silver ore was shipped to the Selby smelter, Contra Costa County, for recovery of silver, gold, and lead. Some recoverable zinc was contained in the ore. About 485 feet of tunnel was rehabilitated during the year, yielding 100 tons of development work.

**Amador.**—Sand produced near Ione by Owens-Illinois and Ione Clay & Sand Co. was used in glass, firebrick, and flue lining. Paving sand and gravel was produced by crews of the Amador County Road Department and by a contractor for the State on Highway 88. Harbison-Walker Refractories Co. worked the Custer quarry south of Ione for quartzite used in silica brick. More than 1,000 tons of dimension building stone and roofing granules was produced by Sierra

Digitized by Google

Madre Stone Co. from its quarry near Volcano. State highway maintenance crews mined granite for fill.

Lignite mined near Ione by American Lignite Products Co., Inc., was processed in the company's Buena Vista plant to recover montan wax and various byproducts. Fire clay was shipped from deposits in the Ione area and from stockpiles by Gladding, McBean & Co., Pacific Clay Products Co., Ione Clay & Sand Co., and Harbison-Walker Refractories Co. This last company planned to acquire the Winter clay pit 3 miles northwest of Ione, effective January 1, 1961. Most of the clays mined in the Ione area were used in refractories and heavy clay products, but one company sold clays for use in pottery, as a carrier in insecticides, and for filler uses. Soapstone mined on the Rancheria property, near Sutter Creek, by Industrial Minerals & Chemical Co. was ground in the producer's Sacramento County mill for consumption in insecticides and rubber.

Three lode gold prospects, two near Pioneer and one near Enterprise, were the sources of gold ore mined and treated to recover gold and silver. Cleanup operations at two gold properties, one each near Jackson and Pine Grove, yielded a few ounces of gold and silver. A relatively small quantity of gold was produced from bench gravel worked by hydraulic methods on the Lancha Plana placer claims in Jackson Valley.

**Butte.**—Although the number of producing dry-gas wells was virtually unchanged from 1959, gas production rose 29 percent. The number of proved productive areas increased slightly and all gas fields in the county except the Llano Seco field had increased output. The greatest percentage increase in production occurred at the Schohr Ranch field (three wells). The Wild Goose field was the fifth largest dry-gas producer in the State.

Increased quantities of sand and gravel were needed to meet requirements of public works projects conducted in preparation for constructing the Oroville Dam and for highway reconstruction and resurfacing near Gridley, Chico, and Oroville. Producers in the area reclaimed these materials from old dredge and hydraulic tailings and from stream bed gravels in Dry Creek and the Feather and Sacramento Rivers. Output was used mostly for structural and paving purposes. Basalt rock and miscellaneous stone were quarried and prepared by State and County road crews for highway maintenance.

The extensive exploration and development carried on by Standard Slag Co. in 1959 at the Rusty Ridge iron property in the Table Mountain area yielded more than 10,000 tons of shipping grade ore in 1960. The output was exported. The deposit proved to be a pocket that was exhausted of economic-grade ore during the year, and the mine was abandoned. Stream gravels near the junction of the south fork and middle fork of the Feather River yielded gold and silver. Gold ore from the Hungry Jack mine near Big Bend contained recoverable gold and silver. The Silver King & Queen lead-zinc claims in the Philbrook Reservoir area were the source of small quantities of gold, silver, lead, and zinc.

**Calaveras.**—General use, moderate heat, high-early-strength, and plastic cements were produced in the five-kiln wet-process plant of Calaveras Cement Co. at Kentucky House, south of San Andreas.

Digitized by Google

Bulk and bag shipments were made by truck and rail to California markets and to distributors in Nevada and Oregon. Considerable development was conducted at two quarries near San Andreas where the company obtained limestone used in cement. Rough dimension stone was quarried near Mokelumne Hill by Harley H. Kreth. Altaville Aggregates worked the Peirano quarry to produce roofing granules. County road crews obtained stone from the Amelia Meuli quarry near Vallecito and the Elma Clark quarry south of Wilseyville. State highway maintenance crews quarried decomposed granite for fill.

Silica sand was prepared for the glass industry by Pacific Clay Products Co. at Camanche; flotation was used to control the feldspar content. Sand and gravel was produced and prepared for building and paving at the Neilsen Gravel Plant, San Andreas, and by crews and contractors of the County and the U.S. Forest Service. The largest clay and shale operation in the county was southeast of San Andreas, where these materials were mined for use in portland cement. Fire clay and miscellaneous clay were hauled from stockpiles maintained by Pacific Clay Products Co. at its Camanche, Snyder (Buena Vista), and Valley Springs operations, and by California Pottery Co. from Valley Springs. The clays were used in manufacturing heavy clay products. Cleanup operations at placers in the Angels Camp and Campo Seco areas yielded a few ounces of gold and silver. Gold ore shipped from the Tom Smith prospect near Sheep Ranch contained recoverable gold and silver.

**Colusa.**—Dry-gas production rose 78 percent above 1959. Several new discoveries were made during the year: By Western Gulf Oil Co. (Buckeye field) on January 1, Universal Consolidated Oil Co. (new pool in Compton Landing field) on September 26, Cameron Oil Co. (Forbes pool in Grimes field) on January 11, Occidental Petroleum Corp. (Grimes West field) on December 5, and Gulf Oil Corp. (Kirk field) on October 18. The Grimes West field appeared to be the most productive of these discoveries with an initial flow on December 7 of 17,250,000 cubic feet. Total depth of the well was 8,263 feet with perforations at 7,645–7,656 feet. The productive zone was Upper Cretaceous sands. The Arbuckle field was the most active gasfield with 10 new well completions; Kirkwood had three new completions; Grimes, five and Buckeye, six.

Sand and gravel was produced principally by crews and contractors of the county highway agency and the California Division of Highways. The material was used in reconstructing and resurfacing roads in the Grimes, Maxwell, and Williams areas. Commercial concrete batch plants were operated in the Williams area by Goforth Bros. and Cortena Rock Products Co., who obtained sand and gravel from nearby pits, creek beds, and river bars. A small tonnage of sulfur ore was mined at a property near Wilbur Springs and was used as a soil-conditioner.

**Contra Costa.**—Basalt was obtained from the Tunnel Rock quarry near Orinda; sandstone and quartzite, from surface and underground workings near Richmond and Pacheco; and miscellaneous stone, from a large quarry near Clayton. Major producers of stone were Pacific Cement & Aggregates, Inc., and Henry J. Kaiser Co. in the Clayton

area, and Blake Bros. Co. in Richmond. Most of the stone was used for riprap, concrete aggregate, and road base material. Sand was dug from pits near Cowell and Antioch and dredged from San Francisco Bay, chiefly for building, paving, and railroad ballast. Clays were mined by Port Costa Brick Works and United Materials & Richmond Brick Co. in the Port Costa and Richmond areas, respectively, and used in manufacturing brick. Kaiser Gypsum Co. in Antioch calcined crude gypsum imported from Mexico for use in manufacturing various gypsum products. The crude mineral was also consumed as a retarder in portland cement and as a filler. In the same plant the company expanded crude perlite purchased from a Nevada producer.

One of the State's outstanding dry-gas finds was the McCulloch-Duarte No. 1 about one-half mile south of production in the Los Medanos field in a new fault block. Discovery was made between 3,890 and 4,235 feet with a calculated free flow of 170 million cubic feet. The initial measured flow was 7,900,000 cubic feet through ½-inch bean. Production came from sands of Eocene age. Petroleum coke from refineries at Avon and Rodeo increased substantially above 1959. At yearend, new hydrogen-treating facilities were under consideration at major company refineries. Recovery of hydrogen sulfide at these refineries increased 19 percent over 1959, and elemental sulfur production rose 18 percent. Peat dredging in the San Joaquin River delta yielded a relatively large tonnage of reed-sedge peat, about half of which was packaged and sold as a soil conditioner. The value was up 27 percent from 1959.

**Del Norte.**—Sand and gravel for building and paving was obtained from stream-bed deposits along the Smith and Klamath Rivers, and was prepared by crews and contractors for Government agencies for road construction and maintenance from sources in the same areas. Miscellaneous stone quarried near Crescent City and in other places in the county was used as riprap and roadstone in State and county projects.

A few tons of ore from the Hiouchi prospect in the Myrtle Creek area, east of Crescent City, contained small quantities of recoverable copper and silver.

**El Dorado.**—An appreciable quantity of granite was quarried and much of the output was used in the Upper American River Project of the Sacramento Municipal Utility District; however, road improvements on Highways 50 and 89 and in the Georgetown and Pilot Hill areas also required impressive tonnages. Limestone was produced at two surface and two underground operations for consumption in glass and lime manufacture, sugar refining, metallurgical processes, for concrete and asphalt aggregate, as a filler in fertilizer, and for whiting and roofing granules. California Rock & Gravel Co. quarried limestone near Cool. Diamond Springs Lime Co. produced quicklime and hydrated lime, using an oil-fired rotary kiln and continuous hydrator and stone from its Mountain and Diamond Springs quarries. The Mountain underground quarry near Auburn was mined by room and pillar. El Dorado Limestone Co. also worked an underground limestone quarry near Shingle Springs by shrinkage stoping. Dimension building stone was quarried southeast of Placerville by Sierra Placerite Corp. At its underground workings in Chili Bar, Placer-

Digitized by Google

ville Slate Products Co. mined a substantial tonnage of slate, which was crushed for granules or ground for rock flour. Mine development included about 200 feet of tunneling. Sand and gravel for building, paving, and fill was produced by commercial operators near Placerville and by crews and contractors for Government agencies. The quantity of lightweight aggregate required for construction projects, principally in the Lake Tahoe area, was obtained in neighboring California and Nevada Counties. Pacific Clay Products Co. mined soapstone at its Shrub deposit south of Shingle Springs and shipped the crude mineral to grinders in the San Francisco Bay area.

Cleanup at the Hazel Creek lode-gold mine near Pollock Pines yielded relatively small quantities of gold, silver, lead, and zinc. The Hazel Creek mill, burned early in 1959, was not rebuilt. Development was carried on at the Yellow Jacket gold property near Kelsey, but no production was reported. Prospectors recovered a few ounces of gold and silver from stream gravels along the American River.

**Fresno.**—Crude oil production declined 6 percent from 1959. In 1960, 18 dry holes with a total footage of 122,554 feet were drilled, compared with 25 dry holes and 202,755 feet in 1959. Although a new pool wildcat was brought in by Leda Petroleum on June 27 in the Guijarral Hills field, oil-well completions were comparatively few. At the southeast end of the Helm field, oil was obtained 1,700 feet west of the nearest producer at a depth of 6,853 feet with an initial flow of 144 barrels daily. The southeast Burrel area was extended 2,100 feet northeast when Arrowhead Exploration Co. completed two producers. Shell Oil Co. drilled 30 comparatively shallow holes on its leases in the Coalinga field emphasizing the increased trend toward developing heavy oil with the aid of bottom-hole heaters. Such heaters use electric heating elements to raise the temperature of oil adjacent to the hole walls and thus to increase flow.

Although oil zone natural gas production was down 8 percent, dry-gas output was more than double that of 1959. Socony Mobil Oil Co., Inc., processed wet gas in one plant at Burrel and one near Avenal. Wet gas also was processed in two plants at Coalinga, one each by Standard Oil Co. and Union Oil Co. Production from these four plants was down 30 percent in total natural gas liquids, but LP-gas output increased 24 percent. Union Oil Co. increased plant capacity for butane-propane mixture 7 percent during the year.

Sand and gravel was produced from pits near Coalinga, Fresno, Friant, Pinedale, and Sanger for structural and paving uses by commercial operators, and for maintenance of roads by crews and contractors for Government agencies. Paving requirements were lower than in 1959 as road construction and resurfacing operations were limited to relatively small projects near Mendota, Fresno, and Academy. Dimension stone for monumental use was quarried near Academy by Superior Academy Granite Co. Decomposed granite and miscellaneous stone obtained near Sanger were used as roadstone and fill. Maintenance crews of the U.S. Forest Service produced some stone for riprap. Miscellaneous clay was dug from deposits near Fresno and used in manufacturing heavy clay products by Craycroft Brick Co. The South Dome pumice deposit east of Friant yielded over 1,000 tons of the material for lightweight aggregate. In March,

Digitized by Google

Fresno Perlite Corp. began operating a new perlite-expanding plant to replace one that burned in 1958. Johns-Manville Corp., National Milling & Mining, and Union Carbide Nuclear Co. explored chrysotile asbestos deposits in the same general area northwest of Coalinga. The first two shipped small tonnages to company mills for testing; the third shipped to an out-of-State processing plant.

Several sand and gravel producers, who worked deposits by dragline along the San Joaquin River, recovered notable quantities of gold and silver. Old bricks from the furnace at the Archer mine northwest of Coalinga were furnaced at New Idria, San Benito County, to yield a few flasks of mercury.

Glenn.—Humble Oil Co. made a new gasfield discovery (Angel Slough) about 3½ miles east of Princeton. Initial flow was 2,350,000 cubic feet at 800 pounds pressure from a 13-foot interval between 2,383 and 2,396 feet. Total depth was 7,019 feet, and the hole was plugged at 3,710 feet. The well was completed on June 18. Five new wells were completed during the year. The Beehive Bend gasfield again was a leading producer in the State. Although the main area of this field had a production loss of 8 percent, output from the Willows area was up 84 percent compared with 1959. The total dry-gas yield for the county was 5 percent below 1959.

Nearly 144,000 tons of gravel was produced from the Wyo pit for use as railroad ballast by Southern Pacific Co. Commercial sand and gravel plants were operated near Orland by Mack Rock & Sand Corp. and Orland Sand & Gravel Co. Both companies worked the Stony Creek stream bed. The Willow Creek deposits were worked by Willows Ready Mix Sand & Gravel Co. and by County road maintenance crews. Miscellaneous stone was quarried and prepared for a road project by a contractor for the U.S. Army Corps of Engineers.

Humboldt.—Highway and bridge construction near Dyerville, Bridgeville, Weitchpec, and between Eureka and Fortuna, required large tonnages of stone and sand and gravel compared with 1959 demands for these materials. Virtually all the stone quarried was used for riprap in embankments. Sand and gravel was produced principally from stream-bed deposits along the Eel, Van Dusen, and Mad Rivers. Major commercial producers operated established preparation plants near Arcata and Fortuna. Permanente Cement Co. established a bulk-cement-distribution facility at Eureka to serve consumers from Garberville north into Oregon with cement shipped by rail from the company plant at Permanente.

A new gasfield discovery (Table Bluff) was made June 7 by Zephyr Oil Co. about 2 miles north of Loleta. Total depth was 5,652 feet; production came from the 62-foot interval immediately above bottom. Initial flow was only 800,000 cubic feet, but on June 10 the flow increased to 1,200,000 cubic feet at 1,500 to 1,800 pounds per square inch pressure through a one-eighth inch bean. Total gas production, chiefly from the Eureka gasfield, decreased 6 percent from 1959.

The Copper Bluff mine near Hoopa was the only active lode mine in the county. Celtor Chemical Corp. mined copper ore from this property and processed it in the company mill beginning in April. Concentrate was shipped to smelters in Montana, Washington, Idaho, and California. The Copper Bluff mine supplied a high percentage

Digitized by Google

of the State's recoverable zinc, in addition to important quantities of copper, gold, and silver and several tons of lead. At the mine the company carried on development that included longhole drilling, drifts, and raises, and resulted in more than 8,500 tons of stockpiled development rock. A token quantity of gold was recovered from a few thousand pounds of ore at a prospect near the Klamath River northeast of Orleans.

Imperial.—U.S. Gypsum Co. worked its multiple bench gypsum mine in the Fish Creek Mountains and hauled the crude mineral to the company's gypsum products plant in Plaster City.

Crews and contractors of State and county road agencies produced more than half the county sand and gravel output. Deposits along the New and Alamo Rivers near Brawley, El Centro, and Holtville supplied commercial plants with sand and gravel for aggregate used chiefly in building construction and irrigation systems. Basalt rock from the Navajo quarry near Coyote Wells was prepared for roofing granules. Granite produced at the Mt. Signal quarry and the Pilot Knob quarry (near Winterhaven) was used as riprap by the Imperial Irrigation District and the Bureau of Reclamation. Decomposed granite quarried near Plaster City was used in building streets and driveways.

Pumice mined near Calipatria was used as lightweight aggregate and for landscaping. An open-pit deposit near Ogilby yielded mica (sericite schist), which was ground by the producer for use in manufacturing roofing materials.

Inyo.—The Union Carbide Nuclear Co. Pine Creek operations were enlarged to permit production of ammonium paratungstate and as a result, the quantity and value of tungsten production increased over 1959. The Pine Creek tungsten ores yielded a high percentage of the tungsten, all of the molybdenum, and much of the lode gold and silver produced in California, and was the State's leading source of copper. The Augusta prospect in the Cerro Gordo area was the only copper property in the county that reported any activity during the year. Although eight lead and lead-zinc mines contributed to the lead and zinc production, the lead-zinc ore from the Santa Rosa mine southwest of Keeler and lead ore from the Defense mine east of Darwin supplied 96 percent of the lead output and nearly 99 percent of the zinc. The ores from these two mines also contained more than 27 percent of the silver recovered from all lode mines in the county.

The Chemical Division (formerly Columbia-Southern Chemical Corp.), Pittsburgh Plate Glass Co., recovered sodium compounds from brines of Owens Lake in a plant at Bartlett. Principal products of the processing plant were anhydrous sodium carbonate and sodium sesqui-carbonate. The Gold Hill and Sugar Loaf areas at the Panamint Range and the areas near Big Pine, Big Springs, Keeler, and Tecopa yielded 60 percent of the State's (nearly 18 percent of the Nation's) talc production and shipments. About 1,500 feet of exploratory diamond drilling was done on the Warm Springs (Big Talc) property at Gold Hill, California's leading talc producer. Some of the crude mineral was ground in plants at Laws and Keeler. The Death Valley talc property, west of Shoshone, was operated by Multi Mines, Inc., the first half of 1960 and by Kennedy Minerals Co., Inc.,

Digitized by Google

the remainder of the year. The Hillday (Branson) mine east of Keeler was the source of some sealemite (U.S. Borax and Chemical Co. mined crude borate minerals from underground mines in Cottonwood Canyon (colemanite) and near Shoshone (ulexite), which were refined or further processed in its mill and refinery in Kern County.

Greatly increased tonnages of sand, gravel and stone were required for highway construction near Independence and Shoshone, and for various road and structural projects of State and County road agencies, Los Angeles Aqueduct, Death Valley National Monument, and the U.S. Forest Service. County crews operated a portable crushing and screening plant southwest of Fish Springs to process granite used in road maintenance. Limestone, obtained from the West End quarry north of Searles Lake, was burned chiefly as a source of carbon dioxide used to produce soda ash in a Kern County plant. Quartzite from the Lakeview quarry near Lone Pine was used in manufacturing silica brick by Gladding, McBean & Co. The Iron Mask and Deep Spring quartzite deposits northeast of Big Pine were worked by R. K. Hatch to produce rough construction stone. Miscellaneous stone was quarried near Ballarat by Stutterite Stone Co. and near Death Valley Junction by Harry W. Amey for dimension building stone and terrazzo. Premier Marble Products worked the underground Inyo marble quarry southeast of Lone Pine and prepared building stone, roofing granules, and aggregate used in precast concrete products. Commercial plants prepared sand and gravel for concrete aggregate near Bishop.

Bentonite was mined at the Side Hill open pit and underground property near Death Valley Junction during the latter half of 1960 and was prepared for use in cosmetics and pharmaceuticals. The Ibex bentonite pit southwest of Tecopa was operated by Multi Mines, Inc., until June, at which time it was acquired and worked by Kennedy Minerals Co., Inc. The Ibex clay was used as a component in enameling. Fuller's earth was produced and prepared for filler, filter aid, and absorbent uses by Sierra Talc Co., from the Olancha deposit south of Keeler, and by David Jones, from the Little Joe No. 1 claim east of Olancha. Pumice mined near Little Lake and pumicite from the Van Loon deposit north of Bishop were prepared for use as lightweight aggregate. A relatively small tonnage of volcanic cinder was mined on U.S. Forest Service property and used in road construction. Crude perlite mined near Big Pine was shipped to expanding plants outside the county. Sulfur ore was produced at the Crater mine in the Last Chance Range by Inyo Soil Sulphur Co. and prepared for agricultural use.

Kern.—Crude petroleum production was the highest since 1956; the total value was slightly above 1959 despite a lower unit price. Exploratory drilling led to three new oilfield discoveries, none of which was considered of great importance. Of the two significant oil pool discoveries in California during 1960, one which extended the Belgian Anticline field of the McKittrick group, was made in the county by Shell Oil Co. The find was believed to be in a new fault block. The well was completed January 11, and by February 8 the flow of 34° API gravity oil had increased from 474 to 972 barrels per day at a

Digitized by Google

pressure of 920 pounds per square inch. The most active oil fields were the Kern River and Belridge South. The number of active wells slightly exceeded the 1959 figure.

Natural gas output from oil zones rose 9 percent above 1959 and was processed in 18 Kern County plants. Total value of all plant products declined 3 percent chiefly because of a 5-percent production decline in natural gasoline and cyclic products that was not offset by an 18-percent rise in LP-gas output. Dry-gas output rose slightly from 1959 chiefly as the result of a new field (Shale Flats) discovery and a successful shallower pool (in Canal field) test, both by Shell Oil Co.

U.S. Borax and Chemical Co., the Nation's leading producer of borates and boron compounds, mined crude borates from an open-pit mine near Boron. The crude minerals, including those from company deposits in Inyo County, were processed in nearby facilities. Some of the partly refined minerals were shipped to the company refinery near Los Angeles for further processing. Sodium sulfate was produced as a byproduct in the boron processing plant. A relatively small tonnage of crude borates and some partially refined boron minerals were sold to chemical companies outside the county. Western Salt Co. harvested crude salt from Koehm dry-lake brines by solar evaporation at its Saltdale plant and shipped the crude mineral to Los Angeles consumers for various applications.

Portland cement was manufactured in the Mojave dry-process plant of California Portland Cement Co. and in the Monolith wet-process plant of Monolith Cement Co. Both producers used limestone and sandstone from quarries near their plant sites. Monolith obtained clay and shale for its process from a pit near Tehachapi. Production and shipments of cement declined below 1959 figures at Mojave; output and sales at the Monolith plant both increased. Shipments were made by truck and rail to all nearby States. Major highway construction projects near Lerdo, Bakersfield, and Grapevine required nearly 500,000 tons more sand and gravel than had been produced in the entire county during 1959. Much of the demand was met by plants working deposits along the Kern River near Bakersfield. Other preparation plants were operated in the Lebec, Maricopa, and Inyokern areas. Limestone was obtained from the Castle Butte quarry near Mojave for use as decorative stone. Mojave Rock Products and N. W. Sweetser quarried colored sandstone and quartz northwest of Rosamond and prepared the materials for use as roofing granules and exposed aggregate. Desert Rock Milling Co. quarried building stone and roofing granules near Tehachapi and Rosamond. Nearly 730,000 tons of gypsite was mined for agricultural use near Lost Hills, Maricopa, and Taft. H. M. Holloway, Inc., leading producer of agricultural gypsite in California, conducted an exploratory program that included 83,000 feet of rotary drilling. Other major producers were C. L. Fanning near Lost Hills and Temblor Gypsum Co. near Taft.

Clays used in rotary drilling were mined (or hauled from a company stockpile) by Mojave Corp. at Rodgers Dry Lake near Boron and by McKittrick Mud Co., near McKittrick. Sericite was mined northwest of McKittrick by Excel Minerals Co. for use in absorbents. Macco Corp. hauled drilling clays from stockpiles at a property at

615629—61——13

Crude salt was harvested from several thousand acres of ponds by solar evaporation, and washed and refined at four plants in the county. Leslie Salt Co. operated two plants at Newark, and one at Mt. Eden, and sold crude salt to another Newark refinery. Oliver Bros. Salt Co. also operated a plant at Mt. Eden. Salt-works bitterns from the Newark plants were piped to the nearby chemical plant of Mineral Products Division, Food Machinery Corp., and processed to yield magnesia, synthetic gypsum, and byproduct ethylene dibromide. Dolomite from the company quarry in San Benito County was burned and used to precipitate the magnesium hydroxide. Fibreboard Paper Products Corp. in Emeryville used purchased magnesium hydroxide for manufacturing insulation. The company also calcined crude gypsum from Nevada at Newark for use in wallboard and other gypsum products. At Berkeley, Philadelphia Quartz Co. used purchased magnesite and brucite in producing hydrous magnesium sulfate.

Judson Steel Corp. in Emeryville and Pacific States Steel Corp. in Union City operated open-hearth furnaces, using iron and steel scrap as the source of metal. The latter company's planned completion of a blast furnace was delayed until mid-1962, but new fabricating facilities were completed in July. Brush Beryllium Co. placed its new fabrication plant in operation at Hayward, using eastern beryllium metal to produce machined components for atmospheric and space vehicles and nuclear applications.

Custom grinding plants (nonmetallic minerals) were operated in Berkeley by Industrial Minerals & Chemical Co. and Yuba Milling Co., Division of Metals Disintegrating Co., Inc. The Chemical & Pigment Co. ground purchased metallic and nonmetallic minerals in Oakland. In Emeryville, C. K. Williams Co. produced synthetic and natural iron oxide pigments. Raw materials for the natural pigments were obtained from out-of-State sources.

**Alpine.**—A high percentage of the sulfur ore produced in California during 1960 was obtained from the Leviathan mine near Markleeville by The Anaconda Co. The crude ore was trucked to the producer's copper-leaching plant in Nevada and was used in making sulfuric acid. Virtually the entire sand and gravel and decomposed granite output was used by contractors for the U.S. Forest Service on agency roads or in constructing new sections of State Highway 89 near Picketts.

Claude B. Lovestedt worked the Zaca mine, 6 miles southeast of Markleeville, near Highway 89. The silver ore was shipped to the Selby smelter, Contra Costa County, for recovery of silver, gold, and lead. Some recoverable zinc was contained in the ore. About 485 feet of tunnel was rehabilitated during the year, yielding 100 tons of development work.

**Amador.**—Sand produced near Ione by Owens-Illinois and Ione Clay & Sand Co. was used in glass, firebrick, and flue lining. Paving sand and gravel was produced by crews of the Amador County Road Department and by a contractor for the State on Highway 88. Harbison-Walker Refractories Co. worked the Custer quarry south of Ione for quartzite used in silica brick. More than 1,000 tons of dimension building stone and roofing granules was produced by Sierra

Madre Stone Co. from its quarry near Volcano. State highway maintenance crews mined granite for fill.

Lignite mined near Ione by American Lignite Products Co., Inc., was processed in the company's Buena Vista plant to recover montan wax and various byproducts. Fire clay was shipped from deposits in the Ione area and from stockpiles by Gladding, McBean & Co., Pacific Clay Products Co., Ione Clay & Sand Co., and Harbison-Walker Refractories Co. This last company planned to acquire the Winter clay pit 3 miles northwest of Ione, effective January 1, 1961. Most of the clays mined in the Ione area were used in refractories and heavy clay products, but one company sold clays for use in pottery, as a carrier in insecticides, and for filler uses. Soapstone mined on the Rancheria property, near Sutter Creek, by Industrial Minerals & Chemical Co. was ground in the producer's Sacramento County mill for consumption in insecticides and rubber.

Three lode gold prospects, two near Pioneer and one near Enterprise, were the sources of gold ore mined and treated to recover gold and silver. Cleanup operations at two gold properties, one each near Jackson and Pine Grove, yielded a few ounces of gold and silver. A relatively small quantity of gold was produced from bench gravel worked by hydraulic methods on the Lancha Plana placer claims in Jackson Valley.

**Butte.**—Although the number of producing dry-gas wells was virtually unchanged from 1959, gas production rose 29 percent. The number of proved productive areas increased slightly and all gas fields in the county except the Llano Seco field had increased output. The greatest percentage increase in production occurred at the Schohr Ranch field (three wells). The Wild Goose field was the fifth largest dry-gas producer in the State.

Increased quantities of sand and gravel were needed to meet requirements of public works projects conducted in preparation for constructing the Oroville Dam and for highway reconstruction and resurfacing near Gridley, Chico, and Oroville. Producers in the area reclaimed these materials from old dredge and hydraulic tailings and from stream bed gravels in Dry Creek and the Feather and Sacramento Rivers. Output was used mostly for structural and paving purposes. Basalt rock and miscellaneous stone were quarried and prepared by State and County road crews for highway maintenance.

The extensive exploration and development carried on by Standard Slag Co. in 1959 at the Rusty Ridge iron property in the Table Mountain area yielded more than 10,000 tons of shipping grade ore in 1960. The output was exported. The deposit proved to be a pocket that was exhausted of economic-grade ore during the year, and the mine was abandoned. Stream gravels near the junction of the south fork and middle fork of the Feather River yielded gold and silver. Gold ore from the Hungry Jack mine near Big Bend contained recoverable gold and silver. The Silver King & Queen lead-zinc claims in the Philbrook Reservoir area were the source of small quantities of gold, silver, lead, and zinc.

**Calaveras.**—General use, moderate heat, high-early-strength, and plastic cements were produced in the five-kiln wet-process plant of Calaveras Cement Co. at Kentucky House, south of San Andreas.

Digitized by Google

Bulk and bag shipments were made by truck and rail to California markets and to distributors in Nevada and Oregon. Considerable development was conducted at two quarries near San Andreas where the company obtained limestone used in cement. Rough dimension stone was quarried near Mokelumne Hill by Harley H. Kreth. Altaville Aggregates worked the Peirano quarry to produce roofing granules. County road crews obtained stone from the Amelia Meuli quarry near Vallecito and the Elma Clark quarry south of Wilseyville. State highway maintenance crews quarried decomposed granite for fill.

Silica sand was prepared for the glass industry by Pacific Clay Products Co. at Camanche; flotation was used to control the feldspar content. Sand and gravel was produced and prepared for building and paving at the Neilsen Gravel Plant, San Andreas, and by crews and contractors of the County and the U.S. Forest Service. The largest clay and shale operation in the county was southeast of San Andreas, where these materials were mined for use in portland cement. Fire clay and miscellaneous clay were hauled from stockpiles maintained by Pacific Clay Products Co. at its Camanche, Snyder (Buena Vista), and Valley Springs operations, and by California Pottery Co. from Valley Springs. The clays were used in manufacturing heavy clay products. Cleanup operations at placers in the Angels Camp and Campo Seco areas yielded a few ounces of gold and silver. Gold ore shipped from the Tom Smith prospect near Sheep Ranch contained recoverable gold and silver.

**Colusa.**—Dry-gas production rose 78 percent above 1959. Several new discoveries were made during the year: By Western Gulf Oil Co. (Buckeye field) on January 1, Universal Consolidated Oil Co. (new pool in Compton Landing field) on September 26, Cameron Oil Co. (Forbes pool in Grimes field) on January 11, Occidental Petroleum Corp. (Grimes West field) on December 5, and Gulf Oil Corp. (Kirk field) on October 18. The Grimes West field appeared to be the most productive of these discoveries with an initial flow on December 7 of 17,250,000 cubic feet. Total depth of the well was 8,263 feet with perforations at 7,645–7,656 feet. The productive zone was Upper Cretaceous sands. The Arbuckle field was the most active gasfield with 10 new well completions; Kirkwood had three new completions; Grimes, five and Buckeye, six.

Sand and gravel was produced principally by crews and contractors of the county highway agency and the California Division of Highways. The material was used in reconstructing and resurfacing roads in the Grimes, Maxwell, and Williams areas. Commercial concrete batch plants were operated in the Williams area by Goforth Bros. and Cortena Rock Products Co., who obtained sand and gravel from nearby pits, creek beds, and river bars. A small tonnage of sulfur ore was mined at a property near Wilbur Springs and was used as a soil-conditioner.

**Contra Costa.**—Basalt was obtained from the Tunnel Rock quarry near Orinda; sandstone and quartzite, from surface and underground workings near Richmond and Pacheco; and miscellaneous stone, from a large quarry near Clayton. Major producers of stone were Pacific Cement & Aggregates, Inc., and Henry J. Kaiser Co. in the Clayton

Digitized by Google

area, and Blake Bros. Co. in Richmond. Most of the stone was used for riprap, concrete aggregate, and road base material. Sand was dug from pits near Cowell and Antioch and dredged from San Francisco Bay, chiefly for building, paving, and railroad ballast. Clays were mined by Port Costa Brick Works and United Materials & Richmond Brick Co. in the Port Costa and Richmond areas, respectively, and used in manufacturing brick. Kaiser Gypsum Co. in Antioch calcined crude gypsum imported from Mexico for use in manufacturing various gypsum products. The crude mineral was also consumed as a retarder in portland cement and as a filler. In the same plant the company expanded crude perlite purchased from a Nevada producer.

One of the State's outstanding dry-gas finds was the McCulloch-Duarte No. 1 about one-half mile south of production in the Los Medanos field in a new fault block. Discovery was made between 3,890 and 4,235 feet with a calculated free flow of 170 million cubic feet. The initial measured flow was 7,900,000 cubic feet through ½-inch bean. Production came from sands of Eocene age. Petroleum coke from refineries at Avon and Rodeo increased substantially above 1959. At yearend, new hydrogen-treating facilities were under consideration at major company refineries. Recovery of hydrogen sulfide at these refineries increased 19 percent over 1959, and elemental sulfur production rose 18 percent. Peat dredging in the San Joaquin River delta yielded a relatively large tonnage of reed-sedge peat, about half of which was packaged and sold as a soil conditioner. The value was up 27 percent from 1959.

**Del Norte.**—Sand and gravel for building and paving was obtained from stream-bed deposits along the Smith and Klamath Rivers, and was prepared by crews and contractors for Government agencies for road construction and maintenance from sources in the same areas. Miscellaneous stone quarried near Crescent City and in other places in the county was used as riprap and roadstone in State and county projects.

A few tons of ore from the Hiouchi prospect in the Myrtle Creek area, east of Crescent City, contained small quantities of recoverable copper and silver.

**El Dorado.**—An appreciable quantity of granite was quarried and much of the output was used in the Upper American River Project of the Sacramento Municipal Utility District; however, road improvements on Highways 50 and 89 and in the Georgetown and Pilot Hill areas also required impressive tonnages. Limestone was produced at two surface and two underground operations for consumption in glass and lime manufacture, sugar refining, metallurgical processes, for concrete and asphalt aggregate, as a filler in fertilizer, and for whiting and roofing granules. California Rock & Gravel Co. quarried limestone near Cool. Diamond Springs Lime Co. produced quicklime and hydrated lime, using an oil-fired rotary kiln and continuous hydrator and stone from its Mountain and Diamond Springs quarries. The Mountain underground quarry near Auburn was mined by room and pillar. El Dorado Limestone Co. also worked an underground limestone quarry near Shingle Springs by shrinkage stoping. Dimension building stone was quarried southeast of Placerville by Sierra Placerite Corp. At its underground workings in Chili Bar, Placer-

Digitized by Google

ville Slate Products Co. mined a substantial tonnage of slate, which was crushed for granules or ground for rock flour. Mine development included about 200 feet of tunneling. Sand and gravel for building, paving, and fill was produced by commercial operators near Placerville and by crews and contractors for Government agencies. The quantity of lightweight aggregate required for construction projects, principally in the Lake Tahoe area, was obtained in neighboring California and Nevada Counties. Pacific Clay Products Co. mined soapstone at its Shrub deposit south of Shingle Springs and shipped the crude mineral to grinders in the San Francisco Bay area.

Cleanup at the Hazel Creek lode-gold mine near Pollock Pines yielded relatively small quantities of gold, silver, lead, and zinc. The Hazel Creek mill, burned early in 1959, was not rebuilt. Development was carried on at the Yellow Jacket gold property near Kelsey, but no production was reported. Prospectors recovered a few ounces of gold and silver from stream gravels along the American River.

**Fresno.**—Crude oil production declined 6 percent from 1959. In 1960, 18 dry holes with a total footage of 122,554 feet were drilled, compared with 25 dry holes and 202,755 feet in 1959. Although a new pool wildcat was brought in by Leda Petroleum on June 27 in the Guijarral Hills field, oil-well completions were comparatively few. At the southeast end of the Helm field, oil was obtained 1,700 feet west of the nearest producer at a depth of 6,853 feet with an initial flow of 144 barrels daily. The southeast Burrel area was extended 2,100 feet northeast when Arrowhead Exploration Co. completed two producers. Shell Oil Co. drilled 30 comparatively shallow holes on its leases in the Coalinga field emphasizing the increased trend toward developing heavy oil with the aid of bottom-hole heaters. Such heaters use electric heating elements to raise the temperature of oil adjacent to the hole walls and thus to increase flow.

Although oil zone natural gas production was down 8 percent, dry-gas output was more than double that of 1959. Socony Mobil Oil Co., Inc., processed wet gas in one plant at Burrel and one near Avenal. Wet gas also was processed in two plants at Coalinga, one each by Standard Oil Co. and Union Oil Co. Production from these four plants was down 30 percent in total natural gas liquids, but LP-gas output increased 24 percent. Union Oil Co. increased plant capacity for butane-propane mixture 7 percent during the year.

Sand and gravel was produced from pits near Coalinga, Fresno, Friant, Pinedale, and Sanger for structural and paving uses by commercial operators, and for maintenance of roads by crews and contractors for Government agencies. Paving requirements were lower than in 1959 as road construction and resurfacing operations were limited to relatively small projects near Mendota, Fresno, and Academy. Dimension stone for monumental use was quarried near Academy by Superior Academy Granite Co. Decomposed granite and miscellaneous stone obtained near Sanger were used as roadstone and fill. Maintenance crews of the U.S. Forest Service produced some stone for riprap. Miscellaneous clay was dug from deposits near Fresno and used in manufacturing heavy clay products by Craycroft Brick Co. The South Dome pumice deposit east of Friant yielded over 1,000 tons of the material for lightweight aggregate. In March,

Digitized by Google

Fresno Perlite Corp. began operating a new perlite-expanding plant to replace one that burned in 1958. Johns-Manville Corp., National Milling & Mining, and Union Carbide Nuclear Co. explored chrysotile asbestos deposits in the same general area northwest of Coalinga. The first two shipped small tonnages to company mills for testing; the third shipped to an out-of-State processing plant.

Several sand and gravel producers, who worked deposits by dragline along the San Joaquin River, recovered notable quantities of gold and silver. Old bricks from the furnace at the Archer mine northwest of Coalinga were furnaced at New Idria, San Benito County, to yield a few flasks of mercury.

**Glenn.**—Humble Oil Co. made a new gasfield discovery (Angel Slough) about 3½ miles east of Princeton. Initial flow was 2,350,000 cubic feet at 800 pounds pressure from a 13-foot interval between 2,383 and 2,396 feet. Total depth was 7,019 feet, and the hole was plugged at 3,710 feet. The well was completed on June 18. Five new wells were completed during the year. The Beehive Bend gasfield again was a leading producer in the State. Although the main area of this field had a production loss of 8 percent, output from the Willows area was up 84 percent compared with 1959. The total dry-gas yield for the county was 5 percent below 1959.

Nearly 144,000 tons of gravel was produced from the Wyo pit for use as railroad ballast by Southern Pacific Co. Commercial sand and gravel plants were operated near Orland by Mack Rock & Sand Corp. and Orland Sand & Gravel Co. Both companies worked the Stony Creek stream bed. The Willow Creek deposits were worked by Willows Ready Mix Sand & Gravel Co. and by County road maintenance crews. Miscellaneous stone was quarried and prepared for a road project by a contractor for the U.S. Army Corps of Engineers.

**Humboldt.**—Highway and bridge construction near Dyerville, Bridgeville, Weitchpec, and between Eureka and Fortuna, required large tonnages of stone and sand and gravel compared with 1959 demands for these materials. Virtually all the stone quarried was used for riprap in embankments. Sand and gravel was produced principally from stream-bed deposits along the Eel, Van Dusen, and Mad Rivers. Major commercial producers operated established preparation plants near Arcata and Fortuna. Permanente Cement Co. established a bulk-cement-distribution facility at Eureka to serve consumers from Garberville north into Oregon with cement shipped by rail from the company plant at Permanente.

A new gasfield discovery (Table Bluff) was made June 7 by Zephyr Oil Co. about 2 miles north of Loleta. Total depth was 5,652 feet; production came from the 62-foot interval immediately above bottom. Initial flow was only 800,000 cubic feet, but on June 10 the flow increased to 1,200,000 cubic feet at 1,500 to 1,800 pounds per square inch pressure through a one-eighth inch bean. Total gas production, chiefly from the Eureka gasfield, decreased 6 percent from 1959.

The Copper Bluff mine near Hoopa was the only active lode mine in the county. Celtor Chemical Corp. mined copper ore from this property and processed it in the company mill beginning in April. Concentrate was shipped to smelters in Montana, Washington, Idaho, and California. The Copper Bluff mine supplied a high percentage

Digitized by Google

of the State's recoverable zinc, in addition to important quantities of copper, gold, and silver and several tons of lead. At the mine the company carried on development that included longhole drilling, drifts, and raises, and resulted in more than 8,500 tons of stockpiled development rock. A token quantity of gold was recovered from a few thousand pounds of ore at a prospect near the Klamath River northeast of Orleans.

**Imperial.**—U.S. Gypsum Co. worked its multiple bench gypsum mine in the Fish Creek Mountains and hauled the crude mineral to the company's gypsum products plant in Plaster City.

Crews and contractors of State and county road agencies produced more than half the county sand and gravel output. Deposits along the New and Alamo Rivers near Brawley, El Centro, and Holtville supplied commercial plants with sand and gravel for aggregate used chiefly in building construction and irrigation systems. Basalt rock from the Navajo quarry near Coyote Wells was prepared for roofing granules. Granite produced at the Mt. Signal quarry and the Pilot Knob quarry (near Winterhaven) was used as riprap by the Imperial Irrigation District and the Bureau of Reclamation. Decomposed granite quarried near Plaster City was used in building streets and driveways.

Pumice mined near Calipatria was used as lightweight aggregate and for landscaping. An open-pit deposit near Ogilby yielded mica (sericite schist), which was ground by the producer for use in manufacturing roofing materials.

**Inyo.**—The Union Carbide Nuclear Co. Pine Creek operations were enlarged to permit production of ammonium paratungstate and as a result, the quantity and value of tungsten production increased over 1959. The Pine Creek tungsten ores yielded a high percentage of the tungsten, all of the molybdenum, and much of the lode gold and silver produced in California, and was the State's leading source of copper. The Augusta prospect in the Cerro Gordo area was the only copper property in the county that reported any activity during the year. Although eight lead and lead-zinc mines contributed to the lead and zinc production, the lead-zinc ore from the Santa Rosa mine southwest of Keeler and lead ore from the Defense mine east of Darwin supplied 96 percent of the lead output and nearly 99 percent of the zinc. The ores from these two mines also contained more than 27 percent of the silver recovered from all lode mines in the county.

The Chemical Division (formerly Columbia-Southern Chemical Corp.), Pittsburgh Plate Glass Co., recovered sodium compounds from brines of Owens Lake in a plant at Bartlett. Principal products of the processing plant were anhydrous sodium carbonate and sodium sesqui-carbonate. The Gold Hill and Sugar Loaf areas at the Panamint Range and the areas near Big Pine, Big Springs, Keeler, and Tecopa yielded 60 percent of the State's (nearly 18 percent of the Nation's) talc production and shipments. About 1,500 feet of exploratory diamond drilling was done on the Warm Springs (Big Talc) property at Gold Hill, California's leading talc producer. Some of the crude mineral was ground in plants at Laws and Keeler. The Death Valley talc property, west of Shoshone, was operated by Multi Mines, Inc., the first half of 1960 and by Kennedy Minerals Co., Inc.,

Digitized by Google

the remainder of the year. The Holliday (Branson) mine east of Keeler was the source of some steatite talc. U.S. Borax and Chemical Co. mined crude borate minerals from underground mines in Corkscrew Canyon (colemanite) and near Shoshone (ulexite), which were refined or further processed in its mill and refinery in Kern County.

Greatly increased tonnages of sand, gravel and stone were required for highway construction near Independence and Shoshone, and for various road and structural projects of State and County road agencies, Los Angeles Aqueduct, Death Valley National Monument, and the U.S. Forest Service. County crews operated a portable crushing and screening plant southwest of Fish Springs to process granite used in road maintenance. Limestone, obtained from the West End quarry north of Searles Lake, was burned chiefly as a source of carbon dioxide used to produce soda ash in a Kern County plant. Quartzite from the Lakeview quarry near Lone Pine was used in manufacturing silica brick by Gladding, McBean & Co. The Iron Mask and Deep Spring quartzite deposits northeast of Big Pine were worked by R. K. Hatch to produce rough construction stone. Miscellaneous stone was quarried near Ballarat by Stutterite Stone Co. and near Death Valley Junction by Harry W. Amey for dimension building stone and terrazzo. Premier Marble Products worked the underground Inyo marble quarry southeast of Lone Pine and prepared building stone, roofing granules, and aggregate used in precast concrete products. Commercial plants prepared sand and gravel for concrete aggregate near Bishop.

Bentonite was mined at the Side Hill open pit and underground property near Death Valley Junction during the latter half of 1960 and was prepared for use in cosmetics and pharmaceuticals. The Ibex bentonite pit southwest of Tecopa was operated by Multi Mines, Inc., until June, at which time it was acquired and worked by Kennedy Minerals Co., Inc. The Ibex clay was used as a component in enameling. Fuller's earth was produced and prepared for filler, filter aid, and absorbent uses by Sierra Talc Co., from the Olancha deposit south of Keeler, and by David Jones, from the Little Joe No. 1 claim east of Olancha. Pumice mined near Little Lake and pumicite from the Van Loon deposit north of Bishop were prepared for use as lightweight aggregate. A relatively small tonnage of volcanic cinder was mined on U.S. Forest Service property and used in road construction. Crude perlite mined near Big Pine was shipped to expanding plants outside the county. Sulfur ore was produced at the Crater mine in the Last Chance Range by Inyo Soil Sulphur Co. and prepared for agricultural use.

**Kern.**—Crude petroleum production was the highest since 1956; the total value was slightly above 1959 despite a lower unit price. Exploratory drilling led to three new oilfield discoveries, none of which was considered of great importance. Of the two significant oil pool discoveries in California during 1960, one which extended the Belgian Anticline field of the McKittrick group, was made in the county by Shell Oil Co. The find was believed to be in a new fault block. The well was completed January 11, and by February 8 the flow of 34° API gravity oil had increased from 474 to 972 barrels per day at a

Digitized by Google

pressure of 920 pounds per square inch. The most active oil fields were the Kern River and Belridge South. The number of active wells slightly exceeded the 1959 figure.

Natural gas output from oil zones rose 9 percent above 1959 and was processed in 18 Kern County plants. Total value of all plant products declined 3 percent chiefly because of a 5-percent production decline in natural gasoline and cyclic products that was not offset by an 18-percent rise in LP-gas output. Dry-gas output rose slightly from 1959 chiefly as the result of a new field (Shale Flats) discovery and a successful shallower pool (in Canal field) test, both by Shell Oil Co.

U.S. Borax and Chemical Co., the Nation's leading producer of borates and boron compounds, mined crude borates from an open-pit mine near Boron. The crude minerals, including those from company deposits in Inyo County, were processed in nearby facilities. Some of the partly refined minerals were shipped to the company refinery near Los Angeles for further processing. Sodium sulfate was produced as a byproduct in the boron processing plant. A relatively small tonnage of crude borates and some partially refined boron minerals were sold to chemical companies outside the county. Western Salt Co. harvested crude salt from Koehm dry-lake brines by solar evaporation at its Saltdale plant and shipped the crude mineral to Los Angeles consumers for various applications.

Portland cement was manufactured in the Mojave dry-process plant of California Portland Cement Co. and in the Monolith wet-process plant of Monolith Cement Co. Both producers used limestone and sandstone from quarries near their plant sites. Monolith obtained clay and shale for its process from a pit near Tehachapi. Production and shipments of cement declined below 1959 figures at Mojave; output and sales at the Monolith plant both increased. Shipments were made by truck and rail to all nearby States. Major highway construction projects near Lerdo, Bakersfield, and Grapevine required nearly 500,000 tons more sand and gravel than had been produced in the entire county during 1959. Much of the demand was met by plants working deposits along the Kern River near Bakersfield. Other preparation plants were operated in the Lebec, Maricopa, and Inyokern areas. Limestone was obtained from the Castle Butte quarry near Mojave for use as decorative stone. Mojave Rock Products and N. W. Sweetser quarried colored sandstone and quartz northwest of Rosamond and prepared the materials for use as roofing granules and exposed aggregate. Desert Rock Milling Co. quarried building stone and roofing granules near Tehachapi and Rosamond. Nearly 730,000 tons of gypsite was mined for agricultural use near Lost Hills, Maricopa, and Taft. H. M. Holloway, Inc., leading producer of agricultural gypsite in California, conducted an exploratory program that included 83,000 feet of rotary drilling. Other major producers were C. L. Fanning near Lost Hills and Temblor Gypsum Co. near Taft.

Clays used in rotary drilling were mined (or hauled from a company stockpile) by Mojave Corp. at Rodgers Dry Lake near Boron and by McKittrick Mud Co., near McKittrick. Sericite was mined northwest of McKittrick by Excel Minerals Co. for use in absorbents. Macco Corp. hauled drilling clays from stockpiles at a property at

615629—61——13

Digitized by Google

Buckhorn Lake which had been purchased by the Federal Government and made a part of Edwards Air Force Base. American Minerals Co. mined clay from its White Rock deposit near Cantil for use in whiteware. A property between Mojave and Inyokern was the source of pumice prepared and sold for use in absorbents, abrasives, and cleaning and scouring compounds. Diatomite was mined in open pits about 10 miles northwest of McKittrick. The material was processed by the producer for use as an absorbent. The Progressive Mining & Drilling Corp. of Nevada reactivated the Ritter barite property near Loraine and shipped the output to a grinding plant at Terminal Island, Los Angeles County.

Six lode-gold mines in the Randsburg area, including cleanup operations at two, yielded most of the gold and silver produced. The Wegman group of claims south of Mojave and the Uncle Sam prospect near the Havilah Ranger Station contributed to the lode gold and silver output in the county. A few ounces of gold and silver were recovered from ores of the Gwynne tungsten mine south of Claraville. Cinnabar ore, mined from the Fickert-Durnal open pits near Keene while completing exploration and development work, was retorted to yield several flasks of mercury. The Travertine uranium prospect near Lake Isabella was active most of 1960 although no ore was shipped. While extending a drift, some development rock was produced and stockpiled.

**Kings.**—Petroleum production declined 4 percent below 1959 despite two new oil pool discoveries, both in the Guijarral Hills field of the Coalinga Group. The first discovery was in the Main Area on May 30 by Union Oil Co. and the second in the Northwest Area on June 27 by Leda Petroleum Co. Crude petroleum was processed in a cracking and skimming plant at Hanford operated by Caminol Co. Gas output from oil zones dropped 23 percent from 1959. The wet gas was processed in four plants near Avenal, three operated by Standard Oil Co. and one by Socony Mobile Oil Co. The quantity of natural gasoline and cyclic products produced in these plants was nearly 11 percent lower, but the volume of LP-gas was slightly higher than in 1959. Dry-gas production rose 17 percent. The Trico gas area, which lies partly within the county, was the most productive, with 13 new development wells completed during 1960.

Construction of facilities, including extensive hangar aprons at Lemoore Naval Air Station and road widening north of Hanford, required appreciably larger tonnages of stone and sand and gravel than were produced in 1959. The additional quantities of these materials needed as base coarse and concrete aggregate at these projects were obtained from preparation plants in Fresno and Tulare Counties. McPhaill Gypsum Co. mined agricultural gypsite from deposits southeast of Avenal in the Kettleman Hills area.

Cinnabar ore mined at the Little King (Fredanna) claims near Parkfield was furnaced, and ore from the Dawson pit near Avenal was retorted to recover mercury. Exploration and development work completed during the year at the Little King mine included tunnels, crosscuts, and rotary drilling.

**Lake.**—Output of sand and gravel at both commercial and Government and contractor operations was substantially below 1959. Much

Digitized by Google

of the decline was attributed to reduced need for paving aggregate in major State highway projects, some of which had been completed during 1959. Virtually all sand and gravel produced came from stream-bed deposits near Clear Lake. Miscellaneous stone was quarried by Government contractors and obtained from local farms for use as riprap in road and levee construction. The Clear Lake area also was the source of large tonnages of pumice, pumicite, and volcanic cinder sold for lightweight aggregate, roofing material, ornamental rock, and fill. Two prospects near Kelsyville and Clearlake Oaks yielded sulfur ore that was sold for use as a soil aid.

Ore from the Abbott underground mercury mine in Grizzly Canyon near the Colusa County line was furnaced and yielded several hundred flasks of the metal. Exploration and development at this property included raises, winzes, crosscuts, and diamond drilling. A few pounds of mercury was recovered from development rock produced in sinking a shaft at the Juanita property near Middletown, but no metal was shipped.

**Lassen.**—Essentially all the sand and gravel was produced by crews and contractors for Federal, State and county agencies. Crews from the Sierra Ordnance Depot obtained granite for fill 2 miles west of the Skedaddle Creek bridge. A contractor supplied the same agency with miscellaneous stone for use as railroad ballast. Susanville Marble & Granite Works prepared granite for curbing at its quarry 5 miles south of Susanville. Volcanic cinder production declined substantially from 1959 chiefly because of lesser requirements in road construction and maintenance by Government agencies. The material was mined near Susanville for lightweight aggregate used locally.

The Cornelia C No. 2 mine near Hallelujah Junction was the source of uranium ore shipped to a Utah processing plant. In 1959 and 1957, this mine had yielded ore that was consigned to the same processor.

**Los Angeles.**—Crude oil production was slightly higher than in 1959, however, average unit value declined 12 cents per barrel, resulting in a total value that was $7.3 million less than in 1959. More exploratory wells were drilled for oil in Los Angeles County than in any other except Kern. However, there were only three successful completions. Two of these were made when Union Oil Co. discovered the Las Cienegas field with a well completion on June 20 and made a new pool discovery in this field on October 12. The other discovery was a successful deeper-pool test by Standard Oil Co. in the Inglewood field when the Marlow-Burns 306 well was completed May 12. In the Wilmington subsidence area, the California Oil and Gas supervisor approved new operating agreements for unitization of an area encompassing 450 producing wells south of Anaheim Street and north of Seaside Boulevard. Such unitization would permit multiple producer ownership to operate as a single property. Most of California's cracking and reforming capacity, 17 of 38 active refineries and 21 of 70 natural gasoline plants, were in the county. Nearly 6 percent less wet gas was produced and processed than in 1959. Output of natural gas liquids was 9 percent less for natural gasoline and cyclic products and 2 percent more for LP-gases. One natural gasoline plant (the East Los Angeles plant of Richfield Oil

Digitized by Google

Corp.) was dismantled, leaving 19 active plants at yearend. Richfield Oil Corp. completed a successful shallower pool test adjacent to the Bandini oilfield with a gas well on June 12. A 61-foot perforation interval between 3,888 and 3,949 feet gave an initial flow of 927 thousand cubic feet at 1,399 pounds pressure. Production came from Pliocene gas sands. The 86-percent increase in dry-gas production over 1959 was attributed principally to this discovery.

Nearly 18.8 million tons of sand and gravel was produced by commercial plants and Government crews and contractors, an 8-percent increase over 1959. A 7-percent gain was reported for structural use and a 9-percent rise for road construction. A substantial tonnage was consumed as aggregate in additional Los Angeles freeway interchanges and extensions. Preparation plants in the Azusa, El Monte, Irwindale, and Sun Valley areas produced more than 1 million tons each for a combined output of nearly 9.5 million tons. Specialty sands for molding, grinding, blast, and engine uses were obtained from deposits near El Segundo, Huntington Park, Torrance, and Walteria. Approximately 1.1 million tons of granite and decomposed granite was quarried, principally for use as riprap and road base. Decorative dimension stone was produced in Palos Verdes and in the Saugus area for building construction, flagging, and rubble. Two producers on Santa Catalina Island operated quarries to supply crushed and broken stone for harbor and breakwater improvements at Long Beach, San Pedro, and Port Hueneme. Blue Diamond Co., Division of The Flintkote Co., manufactured portland cement at Los Angeles, using clinker purchased from California Portland Cement Co. and gypsum shipped from the producer's property in Nevada. The plant output was consumed in Blue Diamond's extensive ready-mixed concrete facilities in southern California. Miscellaneous clay was dug from pits in or near Castaic, Compton, Reseda, Whittier, Monterey Park, Van Nuys, and Torrance and used in manufacturing brick, structural tile, and sewer pipe. Pacific Clay Products Co. announced the closing of its Corona plant, Riverside County, and the transfer of all the machinery and equipment to its Santa Fe Springs plant, which was reported to be the largest vitrified sewer-pipe facility in the United States. The encroaching Los Angeles freeway system forced relocation of the Higgins Brick Co. Monterey Park plant. Soapstone from the Katz property near the Hauser Ranch in Sierra Pelona Valley was ground for asphalt filler and stucco.

Crude vermiculite mined in Montana was exfoliated in the Los Angeles plant of California Zonolite Co. and used for plaster aggregate, thermal and acoustical insulation, and soil additive at nurseries. Seven companies expanded crude perlite received from mines in California, Colorado, Nevada, and New Mexico. Six grinders of talc, soapstone, and pyrophyllite operated Los Angeles plants, principally with crude materials mined in California and Nevada. Calada Materials Co. and Oil Base, Inc., ground crude barite received from company operations, in plants at Terminal Island and Compton, respectively. Southern California Minerals Co. custom-ground feldspar and other crude nonmetals. Gypsum lath, plaster, and wallboard plants were operated by Fibreboard Paper Products Corp., at South Gate, and by Kaiser Gypsum Co., Inc., at Long Beach. The

Digitized by Google

former used crude gypsum from its property in Nevada; the latter imported gypsum from Mexico. At Los Nietos, Sunshine Mica Co. ground crude mica received from South Dakota and imported from India and Mexico. The plant products were used in manufacturing paint and roofing materials.

Waste oil-well brine from the Los Angeles Basin was pumped to the Dow Chemical Co. Orange County plant to recover crude iodine. U.S. Borax and Chemical Co. operated a refinery at Wilmington with crude and partly refined borates received from its operations in Kern County. Some byproduct sodium sulfate also was recovered.

At the Azusa Gravel plant byproduct gold and silver were recovered in washing gravel from the nearby San Gabriel River channel. Stream gravel in the Gold Creek area north of Sunland was worked by small-scale hand methods to yield a few ounces of gold. Steel ingots and finished steel products were produced from ferrous scrap in electric furnaces by Bethlehem Pacific Coast Steel Corp. at Vernon, Southwest Steel Rolling Mills at Los Angeles, and National Supply Co. at Torrance. National Supply added an experimental extremely high-temperature furnace during the year. Columbia-Geneva Steel Division, U.S. Steel Corp., operated open-hearth instead of electric furnaces in Torrance. At Cucamonga, New Pacific Rolling Mills, Inc., began operating a stainless steel rolling mill late in the year.

**Madera.**—Solar Drilling Co. made a gas discovery 1.5 miles south of the Moffat Ranch field, with a well completion on November 9. This successful new-pool wildcat had an initial flow of 4,060,000 cubic feet daily from four intervals beginning at 3,936 feet. Despite this discovery, dry-gas production dropped 10 percent below 1959; no new development wells were added during the year. The county had 12 active gas wells at its three gasfields, compared with 15 in 1959.

Commercial preparation plants near Madera and Chowchilla produced sand and gravel for local aggregate requirements in building construction. The tonnages of sand and gravel and stone produced by Government crews and contractors for road construction and maintenance were appreciably below 1959. At the site of the Mammouth Pool power tunnel project, Bechtel Corp. crushed granite for use as concrete aggregate. Dimension granite was quarried and dressed at the Raymond quarry for use as architectural and monument stone. Pumice and volcanic cinder were dug from deposits a few miles south of Belleview and were prepared for use as lightweight aggregate and as a carrier in pesticides. Hans Sumpf Co. worked a clay deposit near Madera to obtain clayey soil, which was molded and stabilized with emulsified asphalt for use in making adobe brick.

The Strawberry tungsten mine, on the west fork of Granite Creek, was worked by New Idria Mining & Chemical Co. Ore was milled for a 3-month period, and although some concentrate was sold to Union Carbide Nuclear Co., most of the product was consigned to a New York buyer. Part of the shipments came from concentrate held in stock from previous years. The operator did some rehabilitation work at the mine during the year. A relatively small tonnage of development rock was produced in driving raises, drifts, and crosscuts. Exploration work included diamond drilling. The only other active metal mine in the county was the Jessee Belle copper property

Digitized by Google

area, and Blake Bros. Co. in Richmond. Most of the stone was used for riprap, concrete aggregate, and road base material. Sand was dug from pits near Cowell and Antioch and dredged from San Francisco Bay, chiefly for building, paving, and railroad ballast. Clays were mined by Port Costa Brick Works and United Materials & Richmond Brick Co. in the Port Costa and Richmond areas, respectively, and used in manufacturing brick. Kaiser Gypsum Co. in Antioch calcined crude gypsum imported from Mexico for use in manufacturing various gypsum products. The crude mineral was also consumed as a retarder in portland cement and as a filler. In the same plant the company expanded crude perlite purchased from a Nevada producer.

One of the State's outstanding dry-gas finds was the McCulloch-Duarte No. 1 about one-half mile south of production in the Los Medanos field in a new fault block. Discovery was made between 3,890 and 4,235 feet with a calculated free flow of 170 million cubic feet. The initial measured flow was 7,900,000 cubic feet through ½-inch bean. Production came from sands of Eocene age. Petroleum coke from refineries at Avon and Rodeo increased substantially above 1959. At yearend, new hydrogen-treating facilities were under consideration at major company refineries. Recovery of hydrogen sulfide at these refineries increased 19 percent over 1959, and elemental sulfur production rose 18 percent. Peat dredging in the San Joaquin River delta yielded a relatively large tonnage of reed-sedge peat, about half of which was packaged and sold as a soil conditioner. The value was up 27 percent from 1959.

**Del Norte.**—Sand and gravel for building and paving was obtained from stream-bed deposits along the Smith and Klamath Rivers, and was prepared by crews and contractors for Government agencies for road construction and maintenance from sources in the same areas. Miscellaneous stone quarried near Crescent City and in other places in the county was used as riprap and roadstone in State and county projects.

A few tons of ore from the Hiouchi prospect in the Myrtle Creek area, east of Crescent City, contained small quantities of recoverable copper and silver.

**El Dorado.**—An appreciable quantity of granite was quarried and much of the output was used in the Upper American River Project of the Sacramento Municipal Utility District; however, road improvements on Highways 50 and 89 and in the Georgetown and Pilot Hill areas also required impressive tonnages. Limestone was produced at two surface and two underground operations for consumption in glass and lime manufacture, sugar refining, metallurgical processes, for concrete and asphalt aggregate, as a filler in fertilizer, and for whiting and roofing granules. California Rock & Gravel Co. quarried limestone near Cool. Diamond Springs Lime Co. produced quicklime and hydrated lime, using an oil-fired rotary kiln and continuous hydrator and stone from its Mountain and Diamond Springs quarries. The Mountain underground quarry near Auburn was mined by room and pillar. El Dorado Limestone Co. also worked an underground limestone quarry near Shingle Springs by shrinkage stoping. Dimension building stone was quarried southeast of Placerville by Sierra Placerite Corp. At its underground workings in Chili Bar, Placer-

Digitized by Google

ville Slate Products Co. mined a substantial tonnage of slate, which was crushed for granules or ground for rock flour. Mine development included about 200 feet of tunneling. Sand and gravel for building, paving, and fill was produced by commercial operators near Placerville and by crews and contractors for Government agencies. The quantity of lightweight aggregate required for construction projects, principally in the Lake Tahoe area, was obtained in neighboring California and Nevada Counties. Pacific Clay Products Co. mined soapstone at its Shrub deposit south of Shingle Springs and shipped the crude mineral to grinders in the San Francisco Bay area.

Cleanup at the Hazel Creek lode-gold mine near Pollock Pines yielded relatively small quantities of gold, silver, lead, and zinc. The Hazel Creek mill, burned early in 1959, was not rebuilt. Development was carried on at the Yellow Jacket gold property near Kelsey, but no production was reported. Prospectors recovered a few ounces of gold and silver from stream gravels along the American River.

Fresno.—Crude oil production declined 6 percent from 1959. In 1960, 18 dry holes with a total footage of 122,554 feet were drilled, compared with 25 dry holes and 202,755 feet in 1959. Although a new pool wildcat was brought in by Leda Petroleum on June 27 in the Guijarral Hills field, oil-well completions were comparatively few. At the southeast end of the Helm field, oil was obtained 1,700 feet west of the nearest producer at a depth of 6,853 feet with an initial flow of 144 barrels daily. The southeast Burrel area was extended 2,100 feet northeast when Arrowhead Exploration Co. completed two producers. Shell Oil Co. drilled 30 comparatively shallow holes on its leases in the Coalinga field emphasizing the increased trend toward developing heavy oil with the aid of bottom-hole heaters. Such heaters use electric heating elements to raise the temperature of oil adjacent to the hole walls and thus to increase flow.

Although oil zone natural gas production was down 8 percent, dry-gas output was more than double that of 1959. Socony Mobil Oil Co., Inc., processed wet gas in one plant at Burrel and one near Arenal. Wet gas also was processed in two plants at Coalinga, one each by Standard Oil Co. and Union Oil Co. Production from these four plants was down 30 percent in total natural gas liquids, but LP-gas output increased 24 percent. Union Oil Co. increased plant capacity for butane-propane mixture 7 percent during the year.

Sand and gravel was produced from pits near Coalinga, Fresno, Friant, Pinedale, and Sanger for structural and paving uses by commercial operators, and for maintenance of roads by crews and contractors for Government agencies. Paving requirements were lower than in 1959 as road construction and resurfacing operations were limited to relatively small projects near Mendota, Fresno, and Academy. Dimension stone for monumental use was quarried near Academy by Superior Academy Granite Co. Decomposed granite and miscellaneous stone obtained near Sanger were used as roadstone and fill. Maintenance crews of the U.S. Forest Service produced some stone for riprap. Miscellaneous clay was dug from deposits near Fresno and used in manufacturing heavy clay products by Craycroft Brick Co. The South Dome pumice deposit east of Friant yielded over 1,000 tons of the material for lightweight aggregate. In March,

Digitized by Google

near Madera. Fresno County Land Development Co. operated the mine and mill about half the year. Flotation concentrate produced was shipped to an Arizona smelter for recovery of copper, gold, and silver. The company completed about 500 feet of diamond drilling as part of an exploratory program.

**Marin.**—An increased tonnage of sand and gravel was required to meet demands for construction of the Nicasio Dam, highway interchanges, and general road improvements. Sand and gravel requirements for public works projects were supplied by Government crews and contractors from various stream-bed deposits, supplemented by aggregate produced at basalt and sandstone quarries near San Rafael and Novato by Basalt Rock Co. and near Greenbrae by Hutchinson Co. A substantial tonnage of crushed stone was used for taxiway and hardstand construction at Hamilton Air Force Base. Nearly 40 percent of the sandstone produced at McNear quarry near San Rafael was barged up the Sacramento River for use as riprap in levee embankments.

Shale quarried from a deposit in San Pedro hill west of San Rafael was used by L.P. McNear Brick Co. in manufacturing brick and by The McNear Co. to produce lightweight (Haydite) aggregate. The Haydite plant used oil-fired rotary kilns to expand the shale, some of which was subsequently crushed and sized for use in manufacturing concrete products. The expanded product was sold bagged and in bulk. Perlite Products Co. began operating its Sausalito expanding plant, using crude ore from California and Nevada mines.

Mercury was recovered by retorting cinnabar ore produced at the Edwards mine on the Bently Ranch east of Marshall.

**Mariposa.**—Crews and contractors of Federal, State and county agencies used most of the sand and gravel output for road construction and maintenance. Substantial quantities were supplied by the Mariposa Sand and Gravel Co. for paving in Yosemite National Park. Harris Bros. operated a portable crusher in El Portal and stockpiled material for a Federal agency. State deposits in the Aqua Fria area were worked by four operators to produce roofing granules, flagging, and fine-cut slate for walks and walls. Nearly 40,000 square feet of slate flagging, ranging from 1 to 2 inches in thickness, was produced. Mariposa Development Co. stone was obtained from the Bagby Quarry and the Old Mary Harrison mine near Coulterville.

[illegible] the Bear Cat mine near [illegible] were the chief gold and [illegible] Mother Lode properties, exploration and development work [illegible] and mines. More [illegible] Except for a [illegible] the Lucky [illegible]

[illegible] plants at [illegible] that of [illegible] tons. [illegible] and Los Ris

Digitized by Google

areas. Stone was quarried near Rockport and at other places in the county, for road base and for riprap in embankments.

A new mercury prospect, the Empress property on the Crawford Ranch east of Ukiah, was worked, and cinnabar ore was retorted to recover the metal.

**Merced.**—A marked reduction in highway projects, compared with 1959, resulted in a decline in sand and gravel production for building and paving. Most of the 1960 demand for paving material was for county roads, particularly the Lander Avenue extension between Stevinson and Los Banos. The major sand and gravel preparation plants were in the Snelling and Los Banos areas. Agricultural Minerals & Fertilizer Co. mined agricultural gypsite at the Little Panoche property south of Los Banos. The mineral was used locally.

A relatively small quantity of byproduct gold and silver was recovered at the River Rock, Inc., sand and gravel preparation plant on the Merced River near Snelling.

**Modoc.**—Moyer Gravel Co. used a diesel shovel, scraper, and bulldozers to produce sand and gravel from an alluvial terrace on the north fork of the Pit River northeast of Alturas. The material was hauled to a nearby plant and prepared for asphalt and concrete aggregate. Crews and contractors for the City of Alturas, and county and State road agencies, prepared sand and gravel for base course, surfacing and surface-sealing in road construction and maintenance. A substantial tonnage of aggregate was consumed in the realignment and widening of U.S. Highway 395 between Alturas and Likely.

Volcanic cinder was mined on National Forest land for use in road construction and from a deposit at East Sand Butte (Ainshea-Butte) for railroad ballast by Great Northern Railway Co. From a deposit near Tionesta, H. P. Free mined pumice, which was prepared and marketed for lightweight aggregate.

Jeffery & Associates used a dragline, clamshell, bulldozer, and bucket loader to mine peat moss from a bog in Jess Valley, east of Likely. Most of the output was packaged and sold for soil improvement. Although shipments were made to buyers in Arizona, Oregon, Nevada, Washington, Texas, and Utah, California consumers received most of the production.

**Mono.**—Pumice was mined from deposits near Chalfont, Benton, and Lee Vining. Some of the material was prepared and marketed for use in acoustical plaster, as roofing granules, lightweight aggregate, and scouring blocks. The remainder was sold crude as landscaping material. A relatively small tonnage of volcanic cinder mined on National Forest land was used in road construction by the U.S. Forest Service. Sand and gravel was produced and prepared by Government crews and contractors for use in the construction and maintenance of roads. Pyrophyllite mined at the Pacific property near White Mountain by Huntley Industrial Minerals, Inc., was ground in the producer's Laws plant for use in manufacturing ceramics, paint, and gypsum board. The company dug kaolin from the Little Antelope clay deposit near Casa Diablo from May through December. The mineral was prepared for use in whiteware, paint, paper, plaster, and a variety of other uses.

Digitized by Google

A comparatively small tonnage of gold-silver ore from the Chemung gold mine near Bridgeport was shipped to the Selby smelter, Contra Costa County. Claude B. Lovestedt worked the Topaz silver-lead mine near Topaz Lake and shipped ore containing lead, silver, and gold to the same smelter. Some trenching and stripping of overburden was done at a uranium prospect near the junction of State Highway 108 and U.S. Highway 395 while completing assessment work, but no ore was produced or shipped.

**Monterey.**—A total of 721 oil wells were in active production during the year, 49 of which were new development wells. The activity, mostly in the San Ardo oil pool, raised production about 500 barrels a day. Much of the increase came from the Lombardi sand of the Campbell area, with peak production occurring in 1960. Forty-five of the new producing wells were added in the San Ardo pool. Several wells in the Monroe Swell area were abandoned. Crude petroleum output was 5 percent above 1959, and natural gas from oil zones rose 15 percent. Virtually the entire output of petroleum and wet gas was processed in Contra Costa and Los Angeles Counties.

Kaiser Aluminum & Chemical Corp. produced quicklime and hydrated lime at a plant in Natividad from limestone and dolomite quarried nearby. The company used three gas-fired rotary kilns and a continuous hydrator to prepare lime for chemical, agricultural, and industrial uses; refractories manufacture; and building uses. Most of the dolomitic lime produced was consumed in the producer's sea-water processing plant at Moss Landing to extract magnesium hydroxide, which was calcined to various grades of magnesia. Much of the magnesia was used with chromite from the Philippine Islands in manufacturing refractories. Near Moss Landing, evaporating ponds, covering about 400 acres, were used for the solar harvesting of salt by Monterey Salt Works.

Sand and gravel output declined from 1,047,000 tons in 1959 to 832,000 tons. The decrease was attributed to reduced requirements for paving materials by county, State, and Federal agencies. Specialty sands were prepared from dune deposits in the Pacific Grove-Pebble Beach area, for blast, engine, and foundry uses, and by Owens-Illinois and Del Monte Properties Co. to produce glass sand. Del Monte operated a flotation plant and produced both feldspar and silica concentrates. The sands and concentrates were blended to supply specialty products, ground and unground, that were used in pottery, pipe, brick, sanitary ware, and for foundry and filler uses. The Kaiser Natividad quarry near Salinas yielded dolomite for such nonlime uses as filler in fertilizers and roofing granules. Roofing granules also were prepared by W. M. Barnes Co. from dolomitic limestone quarried on the Hurt Ranch south of Salinas. Dormody Equipment & Supply Co. worked the Carmel quarry for stone used in building construction. Decomposed granite was stripped from deposits near Monterey, Pebble Beach, and Salinas for use as road base.

**Napa.**—Sand and gravel was produced near Angwin for building and paving use and near Napa as a source for fill material. Basalt Rock Co., Inc., supplied most of the locally produced aggregate, rip-

Digitized by Google

rap, and base material from basalt quarried from its Juarez and Pedrotti operations near Napa. Some of the material was used to improve the road to the producer's new shale deposit at Oakville. County crews worked the Parker Hill pit east of Yountville and produced materials used in road maintenance and repair.

Diatomaceous silica from deposits near Napa was processed for use in pozzolanic cements. From its Alvo quarry, Perlite Aggregates, Inc., mined crude perlite, which was expanded in the company plant near St. Helena. Leslie Salt Co. reported that a first harvest (requiring a 3-year cycle through solar evaporation) was expected in 1961 from an operation along the Napa River near San Pablo Bay that had been in preparation since 1953.

Asbestos Bonding Co. produced chrysotile asbestos at the Phoenix mine near Napa. Four operators worked the James Creek gravels by placer methods to recover mercury that had been washed into the creek bottom from the Oat Hill mined dump. Some of the dump material was retorted by another operator. Ores from the Oat Hill and Oat Hill Extension mines also were processed to yield mercury.

**Nevada.**—The tonnages of sand and gravel and stone produced were limited chiefly to that material needed to pave roads from Truckee north to Hobart Mills and southeast to the Placer County line. Small quantities were produced and used locally in the Truckee and Grass Valley areas for building construction. Heavy grading projects underway over Donner Summit for a 10.5-mile section of the Highway 40 freeway were forerunners of expected major requirements for aggregate. At its Spanish mine near Washington, Industrial Minerals & Chemical Co. mined crude barite that was shipped to company grinding facilities in Alameda and Sacramento Counties. The Sacramento County plant also received some crude ore from the reactivated Democrat barite property in Slump Canyon near the Placer County line.

Although relatively small tonnages of gold ore were mined at the Indiana mine near Grass Valley, the Orleans near Bloomfield, and the Red Ledge near Washington, a high percentage of the lode gold and silver credited to the county was recovered in cleanup operations at the Brunswick-Idaho Maryland, Empire Star, and Lava Cap properties in the Grass Valley-Nevada City area. Cleanup material shipped from the Willow Valley mine, east of Nevada City, to the Selby smelter also contained recoverable copper, lead, and zinc. Except for the output from a dragline operation on Wolf Creek near the Limekiln Ranch, virtually all placer gold and silver was recovered from small-scale stream-gravel operations by itinerant prospectors. Gold and silver recovered by Yuba Mining Co., on the north fork of the Yuba River north of Columbia Hill, in 1958 and 1959, was sold to various buyers in 1960.

**Orange.**—The number of producing oil wells in the county declined from 3,862 to 3,816. This decrease was associated with a corresponding 5-percent decline in crude petroleum production. Despite the production loss, Orange County was again fourth in petroleum output. Socal Oil & Refining Co. operated the only oil refinery in the county, a thermal-cracking plant at Huntington Beach. The volume of wet gas produced was 4 percent below 1959; however, the total natural

Digitized by Google

gas liquids recovered at seven plants (three near Huntington Beach, two near Brea, and one each near La Habra and Placentia) increased. Natural gasoline and cyclic products increased 5 percent in quantity above 1959, and LP-gas output rose 3 percent. Dow Chemical Co. operated the Nation's only iodine extraction plant at Seal Beach, where crude iodine was recovered from waste oil-well brines of the Los Angeles Basin. Western Salt Co. harvested crude salt from 6 ponds of the Newport Bay salt Works at Corona Del Mar. The unscreened product was sold in bulk and in bags to local consumers. Some of the extracted salt-works bitterns was sold for use as a weed killer. Peat humus was dug from the R. W. McClellan & Sons peat pit near Huntington Beach and sold in bulk for use as a soil conditioner. The tonnage marketed was 31 percent under the 1959 figure.

The quantity of sand and gravel produced for building construction increased from 3.4 million tons in 1959 to 4 million tons. The increase for paving projects was 100,000 tons. Preparation plants in the Anaheim, Orange, El Modeno, and San Juan Capistrano areas supplied a substantial part of the production. Specialty sands were obtained from pits near Huntington Beach, Trabuco Canyon, and El Toro and prepared for blast, foundry, and pottery uses. Decomposed granite and miscellaneous stone were quarried by Government contractors for road base and use as rip-rap in flood-control embankments. Kaolin was mined for use in whiteware and foundry ganister by California Nonmetallics, on the Robinson ranch east of Trabuco Canyon Road, and by W. A. Schoeppe Clay Co., from its deposit about 13 miles northwest of El Toro. Miscellaneous clay was dug near Anaheim, Corona, and Huntington Beach and used in manufacturing brick, sewer pipe, and other heavy clay products. The Lahabralite Co. imported crude vermiculite from Transvaal, South Africa, and exfoliated it in a plant in Anaheim for use in premixed plaster, as insulation, and for lightweight aggregate.

**Placer.**—Sand and gravel production declined from 547,000 tons in 1959 to 450,000 tons. A substantial decrease in the output of paving sand and gravel was partly offset by an increase in the tonnage used for structural purposes. Road construction projects were mainly road surface improvements near Roseville and Soda Springs and grading operations near Baxter. Commercial preparation plants were operated near Sheridan, Auburn, Colfax, and Tahoe City. Joe Chevreaux in Auburn, one of the major producers of building and paving sand and gravel, also prepared appreciable quantities of blast sands and of quartz gravels for use as landscape and exposed aggregate. Teichert Aggregates established a new plant near Blackwood Creek, south of Tahoe City, to supply sand and gravel for resort developments and paving projects. Granite was quarried near Rocklin by Union Granite Co. for use as building and monument stone, and crushed for nursery, poultry, and roofing granules. Granite and decomposed granite deposits near Rocklin and Auburn furnished stone used principally for road base and fill. Sierra Nevada Milling Corp., Inc., mined quartz near Colfax and ground it for silica flour and foundry use. The company installed an additional pulverizer at its plant during 1960. Fire clay was mined by

Digitized by Google

Gladding, McBean & Co. and Lincoln Clay Products Co., Inc., from deposits in the Lincoln area, for use in manufacturing brick, structural tile, and sewer pipe.

Except for a few ounces of gold recovered by a dragline operation at Canada Hill and a suction dredge near Colfax, gold and silver production was from one-man operations (itinerant prospectors, snipers, etc.) which recovered placer gold and silver from streambed gravels, using small-scale hand methods.

In 1959 a development program was begun at the Dairy Farm mine, near McCourtney Crossing on the Bear River. The operator constructed ponds to handle copper-bearing mine water, from which cement copper would be recovered. The water was to be pumped from an open pit to an upper pond in the mine dump, percolated down into a series of lower ponds, and then through wooden tanks containing iron scrap. No precipitate had been shipped by the end of 1960.

**Plumas.**—Sand and gravel production increased chiefly because of aggregate needed by Government contractors for road construction and realinement projects near Canyon Dam, Blairsden, and Beckwourth. Producers near Quincy, including Plumas Ready-Mix Concrete and the Bellamy Corp., obtained sand and gravel from the Spanish Creek stream bed for building, paving, filtration sand, and drain rock. The Tobin quarry was worked intermittently by maintenance crews of the Western Pacific Railroad Co. for stone used as riprap. Over 8,000 tons of volcanic cinder was produced from deposits in the National Forest and used by crews of the U.S. Forest Service in road construction.

Copper ore from the Engels mine northeast of Greenville was shipped to the Tacoma, Wash. smelter for recovery of contained copper and silver. The only other active lode mine was the Gold Stripe gold mine west of Greenville. Ore from this property was smelted at Selby, Contra Costa County, to recover a few ounces of gold and silver. Virtually all the placer gold and silver recovered was obtained from stream gravels by prospectors.

**Riverside.**—Kaiser Steel Corp. operated its Eagle Mountain iron mine, the State's major metal mine and one of three active iron mines in 1960. Production and shipments of mine-run ore were 9 and 12 percent, respectively, below 1959 figures. No direct-shipping-grade ore was produced during the year. The run-of-mine ore was upgraded in a nearby plant, and the concentrate was shipped to the company-owned integrated steel plant at Fontana, San Bernardino County, or exported. Less than 200 long tons of the iron concentrate produced were sold to domestic consumers. During the year Kaiser Steel Corp. completed about 5,000 feet of diamond drilling at the mine site as a part of its exploration program. Ores containing gold, silver, and copper from two lode mines, the La Escondida in the Maria Mountains a few miles northeast of Mineral Switch and the Mountaineer about 1 mile east of U.S. Highway 95 near the San Bernardino County line, were shipped to out-of-State copper smelters. At the Ram uranium claims near Twentynine Palms development consisting of trenching, shaft sinking, and raising was completed, but no ore was produced or shipped.

Digitized by Google

Riverside Cement Co. produced portland cement in its 13-kiln dry-process plant at Crestmore for shipment to customers in California, Arizona, and Nevada. The company purchased nearly 73 million kilowatt-hours of electrical energy to operate the plant in 1960. An automatic system for palletizing bagged cement was installed in the newly modernized bagging plant. A new dry-process white-cement plant with capacity to produce 250,000 barrels a year was under construction adjacent to the existing plant. Full-scale production of white cement was expected by June 1961. Sand and gravel production declined to 1.8 million tons. About two-thirds of the 300,000-ton decline was attributed to a decrease in paving requirements and one-third, to a lesser demand for structural uses. Major producers operated fixed plants in Corona, Indio, and Desert Hot Springs areas. The tonnage of glass sand produced near Corona by Owens-Illinois was moderately greater than in 1959. Granite and decomposed granite were quarried and prepared for road base, fill, riprap, and poultry grit. Limestone was mined underground near Crestmore by Riverside Cement Co. and consumed in the producer's cement plant or sold for flux and filler. Limestone quarries were operated near West Riverside and Nightingale as a source of stone used as roofing granules and concrete aggregate. Quarries were worked by Minnesota Mining & Manufacturing Co. and Hugh Seeger Corp. near Corona, and Kenneth J. MacKenzie near White Water to obtain stone used for rubble, riprap, roofing granules, and sand-blasting material.

Clay deposits in the Alberhill, Corona, and Elsinore areas were sources of fire and miscellaneous clay used in manfacturing refractories, heavy clay products, stoneware, and pottery. Pacific Clay Products Co. worked the largest clay deposit in the county north of Terra Cotta. The deposit covered nearly five sections of land. Pacific Clay began unifying its facilities by dismantling its Corona plant and moving the equipment and machinery to Santa Fe Springs in Los Angeles County. The Crestmore shale pit was the source of material used by Riverside Cement Co. in cement manufacture. U.S. Gypsum Co. mined crude gypsum southwest of the Little Maria Mountains and used most of the production in its nearby Midland plaster and wallboard plant. Some flint was collected in the area and shipped for ornamental use. Morongo Corp. mined sand and gravel near Banning, using a dragline. The air-dried sand was ground and sold in bulk for sand blasting, a fertilizer [illegible] and as an ingredient in potting soils. Production was slightly above that in 1959. Several companies continued to explore for oil in the western part of the county, but no significant fields were reported. [illegible] the only producing well in the Pardo Dam area was [illegible].

Newhall. [illegible] more than [illegible] because of the gas discoveries [illegible] Grand [illegible] of the River [illegible] with an initial flow [illegible] discoveries were [illegible] Gas Co. in the Walnut [illegible] completed on March 10,

Digitized by Google

and one by Texaco, Inc. in the River Island field at 3,566 feet on December 4. Initial flow at both wells exceeded 1 million cubic feet.

Reduced sales of aggregate used in building construction were offset somewhat by increased demand for sand and gravel used in paving U.S. Highways 40, 50, and 99, and State Highway 24. McClellan Air Force Base projects, as well as those of City and county agencies, required appreciable quantities of these materials. Pits and stream-bed deposits in the Sacramento, Del Paso, Perkins, and Fair Oaks areas were the principal sources for sand and gravel. The G. R. McDonell clay pit near Sacramento was worked by R. J. Robideaux, and the clay was sold for use in making refractory brick. Sacramento Brick Co. dredged clay near the southwest city limits of Sacramento. Cannon & Co. obtained clay used to manufacture brick near Sloughhouse from April through November. Crude vermiculite received from a Montana mine was exfoliated in the Sacramento plant of California Zonolite Co. and sold for use as lightweight plaster and concrete aggregate, acoustical and thermal insulation, and a soil aid.

Most of the placer gold and silver recovered in the county, and all the platinum, came from the bucketline dredging operation of the Natomas Co. on the American River. Four sand and gravel preparation plants recovered byproduct gold and silver.

**San Benito.**—General purpose, moderate heat, high sulfate resistance, and plastic portland cements were produced by Ideal Cement Co. at San Juan Bautista and shipped by truck to consumers in northern and southern California. A comparatively small tonnage of cement was shipped to Oregon. The company operated four 150-foot kilns to produce clinker for its wet-process plant. Sand and gravel obtained from deposits along the San Benito River near Hollister was prepared by Don L. Rider and Hollister Sand & Gravel Co. for concrete aggregate and road base. Hollister Sand shipped these materials by rail to the San Jose and Redwood City areas. At Logan, crushed and broken stone from the State's largest granite quarry was shipped by rail and truck for riprap, roadstone, aggregate, and railroad ballast. Quarries near San Juan Bautista and Hollister yielded limestone and dolomite used in manufacturing cement and magnesium compounds, respectively. Two producers mined bentonitic clays for enameling, foundry use, fillers, drilling mud ingredient, and other uses. San Benito Clay & Mineral Co. mined clay near Tres Pinos, and Fresno Agricultural & Chemical Co. operated the Vallecitos, Ashurst, and Buckhorn clay deposits near Idria.

Ten mercury mines and prospects were active. The New Idria mine was the Nation's major mercury producer and the only mine in San Benito County that yielded more than 50 flasks of metal. Exploration and development completed at the New Idria included over 200 feet of shafts and raises; more than 2,000 feet of tunnels, drifts, and crosscuts; and more than 5,000 feet of diamond and long-hole drilling. Some exploration and development work also was done at the nearby Elkafajo property, a new mercury prospect. Among the other active mercury mines, the most productive were the San Carlos, Santa Margarita, and Camp No. 2, in the Idria area, and the Juniper near Panoche. The number of producing oil wells remained about the

Digitized by Google

same, but overall production dropped 36 percent below 1959. Most of the decrease was attributed to the Vallecitos field. Despite the appreciable decline in crude petroleum output, wet-gas production rose 2 percent. Dry-gas output was reported for the first time in several years; production came from the Lamerias gas area of the Hollister field. This area was first discovered in 1950 as an oil find and later classified as a dry-gas area. The potential producing wells had been shutin for several years.

**San Bernardino.**—Mineral and natural saline deposits comprising an area larger than Connecticut, Massachusetts, and Rhode Island combined, yielded 30 metal and mineral commodities with a total value greater than the value of mineral output in Nevada. Plants at Colton, Cushenbury, Oro Grande, and Victorville produced 13 million barrels and shipped over 12 million barrels of portland cement during the year. Shipments were made by truck and rail to consumers in California, Nevada, Arizona, Utah, and Colorado. Dry-process manufacture was used at the California Portland Cement Co. nine-kiln Colton plant and the Riverside Cement Co. seven-kiln Oro Grande plant. The Permanente Cement Co. two-kiln Cushenbury plant and the Southwestern Portland Cement Co. nine-kiln Victorville plant used the wet process. More than 288 million kilowatt-hours of electrical energy was consumed by the four plants. Southwestern installed a new baghouse at its Victorville plant during the year to remove cement dust from the kiln smoke.

Saline materials, including sodium borates, boric acid, potassium chloride and sulfate, soda ash, salt cake, elemental bromine, and crude dilithium-sodium phosphate (converted to lithium carborate) were produced from Searles Lake brines by American Potash and Chemical Company. West End Chemical Company operated a plant on the opposite side of this playa to produce sodium borate, soda ash, salt cake and glauber's salt by entirely different processes. The bromine was used mostly by chemical plants in the Los Angeles area; potassium salts were mainly used in preparing fertilizers. The entire output of calcium chloride in California was obtained from Bristol Lake by two plants and refined at a third plant to liquid and flake forms. Crude salt, obtained from Searles, Bristol, and Danby dry-lake brines, was recovered by solar evaporation. Halite was mined with a dragline near Amboy and sold for use in manufacturing chlorine. American Potash and Chemical Company installed a $7 million evaporation plant at its Trona operation to replace older facilities and increase production. Salt was produced by California Salt Company both by solar evaporation and conventional mining and processed for many uses. Pacific Salt Co. recovered salt from holdings of the American Potash & Chemical Corp. on Searles Lake by bulldozer, scraping thin surface layers. The salt was hauled 4 miles to Argus, a rail loading point. Salt harvested near Rice by Metropolitan Water District of Southern California was used entirely in water softening.

Reduced output of limestone quarried near Oro Grande, Colton, Cushenbury, and Victorville for use in cement resulted in a decline in total stone production of about 300,000 tons below 1959. Increased shipments of limestone were made from the Cushenbury quarry for use as flux at the Fontana steel plant. Limestone was also quarried for

Digitized by Google

use in glass, paper, whiting, poultry grit, and roofing granules. Marble-Wite Dolomite, Inc., opened a large dolomite deposit about 7 miles south of Lucerne Valley and produced roofing granules, terrazzo chips, and decorative rock. Granite and decomposed granite were quarried near Colton, Big Bear Lake, and Twentynine Palms, and adjacent to several Government project sites, for use as riprap, roadstone, and fill. Marble quarried in the Victorville and Yucca Valley areas was used for rough and dressed building stone and terrazzo. Sandstone, quartz, and quartzite were quarried near Oro Grande, Hinkley, Baldwin Lake, and Twentynine Palms for cement, filler, rock wool, and building uses, and in foundries and oil refineries. Stone quarried in the Barstow, Baker, and Old Woman Springs areas was used for dimension building stone and roofing and decorative granules. Sand and gravel production declined from 6.3 million tons in 1959 to 5.5 million tons, chiefly because demand for paving aggregate dropped from 2.4 million to 1.7 million tons. Large tonnages of sand and gravel produced from pits and plants between Upland and Redlands were consumed in building and paving.

Four producers supplied more than one-third the State talc output from 14 deposits. Most of the active talc mines were in the Tecopa and Silver Lake-Yucca Grove areas. Western Talc Co. was the county's major producer. Southern California Minerals Co. carried out exploration and development work at its Excelsior and Monarch properties near Tecopa and stockpiled some development rock. Mineral Materials Co. did not mine any pyrophyllite at its Victorite deposit during year, but shipments were made to grinders from stocks. Ball clay was dug at the Hart mine in the Castle Mountains near Ivanpah by Gladding, McBean & Co. and Southern California Minerals Co. for use in pottery and stoneware, floor and wall tile, and refractories. Exploration was in progress at the mine site in an attempt to locate an extension of the deposit. Bentonitic clay mined or withdrawn from stockpiles at the Honey Brown property near Vidal, the Geyser View No. 3 claim near Newberry, and the Hector deposit near Dagget was used to supply trace minerals in animal feeds, as a filter aid, and for many other applications. Miscellaneous clay was obtained from pits near Chino and Highgrove for use in brick manufacture. Shale-Lite Corp. mined shale near Chino and used it to produce expanded lightweight aggregate. Clay and shale from the Cushenbury pit south of Lucerne Valley was used by Permanente Cement Co. Quicklime and hydrated lime was produced by California Portland Cement Co. at its Colton plant for sale to the building trades. West End Chemical Co. produced byproduct quicklime and hydrated lime in its plant at Searles Lake. The output was sold for chemical, industrial, building, and agricultural uses.

Volcanic cinder from a property near Ludlow was used for railroad ballast. Deposits near Cima and north of Hinkley yielded volcanic cinder prepared for use as lightweight aggregate, soil conditioner, and landscaping material. Crude fluorspar from the Pacific Fluorite mine in the Clark Mountain area was purchased by an Ohio company for use in glass manufacture. Oil Base, Inc. shipped crude barite from its Leviathan mine near Yermo to the company processing plant at Compton, Los Angeles County. Crude feldspar produced at the Beck

Digitized by Google

mine near Four Corners was custom-ground in a Los Angeles plant. The average number of producing oil wells rose from 14 in 1959 to 22. Petroleum production dropped 15 percent; wet gas output increased 6 percent. One of three wells drilled during the year was abandoned as dry, and two were suspended. The total footage drilled was only 4,652 feet.

Iron Age Mines Co., at its open-pit magnetite iron mine south of Danby Lake, hand-sorted and ran the crude ore over a magnetic pulley to upgrade the ore for sale to cement and iron and steel producers. Kaiser Steel Corp. operated its integrated steel plant at Fontana, the State's major steel plant and only producer of pig iron. Late in the year Metals and Petroleum Corp. of Los Angeles acquired tungsten placer properties in the Atolia area near Randsburg. Before World War II this area yielded both gold and tungsten. Molybdenum Corp. of America operated its Mountain Pass mine and mill but processed a lower tonnage of barite-bastnasite ore in producing rare-earth concentrate than in 1959. However, shipments of concentrate were more than three times the 1959 tonnage. During the year, the producer reached an agreement with American Potash & Chemical Corp. whereby the latter company would exclusively develop and distribute the rare-earth products in the glass industry. Most of the county's silver, lead, and zinc output was recovered in smelting lead ores, which also contained recoverable gold and copper, from the Bonanza King mine in the Providence Mountains a few miles southeast of Kelso. Ore mined at the Silver Bow property near Calico also yielded silver and lead. Nearly 50 percent of the credited copper output was derived from ore of the Best Yet mine, a few miles west of Needles, which also yielded silver and zinc. Copper ores from the Consolation and Master claims near Spangler, the Copper Queen and Joseph claims north of Barstow, and the Mary Elizabeth mine in the Avawatz Mountains north of Baker, were shipped to an Arizona smelter for recovery of copper and silver. Ore from the Mary Elizabeth mine contained most of the gold output reported in the county. C & C Drilling Co. shipped silver ore from the Good Pay mine near Ord Mountain to the Selby smelter, Contra Costa County. The company completed considerable development work at the mine including shafts, raises, and tunnels. About 1,000 tons of waste was removed to the mine dump and over 3,000 tons of development rock was stockpiled.

**San Diego.**—Sand and gravel production decreased 1.5 million tons from 1959. Paving sand and gravel decreased 1 million tons; sand and gravel for structural uses decreased 500,000 tons. Nearly 3.4 million tons of sand and gravel was produced for construction purposes, and the remainder was used mostly for paving of roads, streets, and airport runways. The principal producers operated pits and plants in the San Diego, El Cajon, and Oceanside areas. Silica sand obtained and prepared near Oceanside was sold for industrial uses, including glass, molding, sand blasting, engine, and filtration. The Escondido and Congo Black quarries near Escondido, the Western Black quarry near Vista, and the Suncrest quarry near El Cajon, were sources of rough and dressed dimension granite quarried for architectural and monumental uses. Operators at the Congo Black and Western Black quarries made surface-bearing plates for equipment in laboratory

Digitized by Google

use. Granite, decomposed granite, and miscellaneous stone quarried in the same general areas were used as riprap, roadstone, and fill material. Basaltic rock was quarried from the Volcan No. 1 and No. 2 claims about 3 miles northeast of Jacumba and prepared for use as roofing granules.

Western Salt Co. harvested crude salt from ponds at South Bay by solar evaporation of sea water and processed the material at Fruitdale for a wide variety of uses. The salt-works bitterns were pumped to the nearby chemical plant of Mineral Products Division, Food Machinery and Chemical Corp., where magnesium chloride was extracted. A limekiln was installed at the Alvarado water treatment plant of the San Diego City Water Department for the calcination of calcium carbonate sludge removed in water treatment. The installation supplied lime for the city's Alvarado and Miramar filtration plants. Miscellaneous clay dug near Del Mar and the Linda Vista Station was used by Sorrento Brick & Clay Products and by Hazard Block Co., respectively. Union Brick Co. mined shale north of Pacific Beach near Highway 101 and consumed it in the company plant. Three pyrophyllite deposits were operated in the San Diequito area during the year. Except for a relatively small tonnage shipped to a Los Angeles chemical plant, the output was consigned to grinders in Escondido and Campo and one in Los Angeles County. Harborlite Corp., in Escondido, expanded crude perlite received from Inyo County and Arizona. Delwin R. Curry worked two gold properties near Pine Valley. Ores of the Eagle Nest group and the Ross Quartz mine were amalgamated to recover gold and silver.

**San Francisco.**—Franciscan chert (red rock) quarried and crushed at Candlestick Point was used for base material in State highway projects and in extending runways at San Francisco International Airport, San Mateo County. Sand was dredged from the bay bordering the city and county, and obtained from ocean-beach dune deposits for use in asphaltic and concrete surfacing and as fill in the Golden Gateway project.

Commercial Minerals Co. purchased limestone and soapstone from El Dorado County, talc from Inyo County, and bentonite from San Benito County. The ores were ground or otherwise processed by the company for resale. Stauffer Chemical Co. processed partly refined borates purchased from a Kern County producer and converted them to various boron and sodium compounds.

**San Joaquin.**—The volume of natural gas produced was more than one and a half times that in 1959. The increased output was attributed mainly to a successful new-field wildcat, two successful new-pool wildcats, and an average of 13 more producing gas wells. Great Basins Petroleum Co. had a successful new-field discovery in the McMullin Ranch area with a well completion on May 4 that had an initial flow of 2,740,000 cubic feet from two producing intervals between 5,925 and 5,970 feet. The company also made a new-pool discovery in the Vernalis field with a successful well completion on May 21. The other successful new-pool wildcat was made by E. C. Brown when his H. D. Towne Unit 2 came in at 3,526 feet on March 31 with an initial flow of more than 2 million cubic feet near the southern boundary of the Thornton gasfield. At yearend the depleted Mac-

Digitized by Google

Donald gasfield was nearly ready for the planned gas storage by Pacific Gas & Electric Co.

Sand and gravel production, principally in the Tracy, Escalon and Clements areas, was moderately lower than in 1959. Requirements for these materials for constructing and surfacing highways north of Clements and south of Lodi and local street and road projects offset somewhat a decline in the quantity used in building construction. A comparatively small tonnage of stone was quarried and crushed near a road project under construction for a military installation. Clays were mined near Stockton and Tracy for use by California Clay Products Co., Stockton Building Materials Co., and Pacific Clay Products Co. Pacific Clay was modernizing its vitrified clay pipe plant at Stockton.

**San Luis Obispo.**—An average of four more producing oil wells yielded 34 percent less petroleum than in 1959. Production came from five fields—Arroyo Grande, Guadalupe, Morales Canyon, Russell Ranch, and Taylor Canyon. There were no new-field or new-pool discoveries during the year. In addition to four new producing wells, two unsuccessful wells were drilled in the Cuyama Valley area; one reached granite at 9,002 feet on August 20, and the other was abandoned as dry at 1,805 feet. Two dry wells, one drilled to 5,200 feet in the Chimney Rock area and the other to 3,303 feet at Midway Sunset, were reported. Natural gas output came from oil zones only and was 15 percent below 1959. Union Oil Company operated a coking and thermal-cracking plant at Arroyo Grande and Richfield Oil Corp. treated wet gas in its natural gasoline and cycle plant near Cuyama. The quantities of natural gasoline and cyclic products credited to the county decreased 17 percent, and the volume of LP-gas produced was 2 percent less than 1959 figures. Reduced output of these materials at commercial plants and by Government crews and contractors was attributed to lesser requirements for sand and gravel in both building and road construction projects. Virtually all the production came from deposits near Cambria, Atascadero, Pismo Beach, and Arroyo Grande. Quarries in the Adelaide, Morro Bay, San Luis Obispo, and Nipomo areas supplied building stone, rubble, riprap, flagging, and road base material. A substantial tonnage of riprap was quarried for embankment use in projects of the U.S. Army Corps of Engineers, State Division of Highways, and the Whale Rock Dam project. The latter was a joint venture of the State Division of Water Resources and the City of San Luis Obispo. San Luis Brick, Inc., dug and used miscellaneous clay from a deposit near the city limits of San Luis Obispo. Superior Gypsum Co. mined agricultural gypsite at the Carisso property several miles east of Simmler.

Although six mercury mines were active, only the Buena Vista, near Klau, yielded more than a few flasks of the metal. Exploration and development completed at this open-pit property included 5,000 feet of rotary drilling and the stripping of about 100,000 cubic yards of waste. Some rotary drilling and stripping was done at the Rinconda mine a few miles southeast of Santa Margarita.

**San Mateo.**—Oystershell and clay, dredged together from San Francisco Bay, were used as basic raw materials to produce portland

Digitized by Google

cement at the Redwood City wet-process plant of Ideal Cement Co., where 235-foot rotary kilns were operated. Shipments of finished cement were made by truck, rail, and water, principally to northern California markets; however, cement also was shipped to customers in southern California, Nevada, and Oregon. Some of the oyster-shell was processed outside the county for use as poultry grit and as a mineral filler in animal feeds. Sand output was limited to the tonnage produced commercially at Pilarchitos Creek near Half Moon Bay, and the quantity produced and used by Government contractors in road projects. Sandstone, limestone, basalt, decomposed granite, and miscellaneous stone were quarried in the Brisbane, Belmont, Redwood City, Rockaway Beach, Woodside, and Pescadero areas. These quarries furnished most of the concrete aggregate, riprap, roadstone, and fill material produced in the county. Stone output increased and was used principally in widening the Bayshore Freeway.

At Redwood City, Leslie Salt Co., with operations extending into Alameda and Santa Clara Counties, harvested a large tonnage of crude salt by solar evaporation of sea water in ponds along San Francisco Bay. Virtually all salt produced at the Redwood City plant was exported or shipped to other States. In south San Francisco, Merck & Co. operated a chemical plant and used a purchased limestone-dolomite mixture in recovering magnesium hydroxide from sea water.

Petroleum and natural (wet) gas production, from an average of twice as many wells, rose 62 and 27 percent, respectively, compared with 1959 figures. The south area of La Honda field, which was discovered in 1959, was the chief producing area. Only one well produced in the Oil Creek area.

**Santa Barbara.**—A new drilling platform was erected for Texaco, Inc., about 1.5 miles offshore, 5 miles west of Gaviota. The double-deck production platform was near a well completion made by Texaco in 1959. This well had been drilled to 6,751 feet, and a formation test reportedly flowed 1,393 barrels daily of 35° API gravity oil and a large amount of gas, but no production was reported in 1960. During the year two notable offshore gas discoveries were made. Standard Oil Co. of California completed a gas well in the Gaviota offshore field on June 16 at a depth of 9,007 feet, and Phillips Petroleum Co. made a gas-well completion September 28 in the Naples offshore field. Standard Oil also began erecting a second platform in the Summerland offshore area. On September 10 Socony Mobil Oil Co., Inc., had a successful shallower pool test in the Cat Canyon field from Pliocene gas sands. The perforation interval was 3,412–3,501 feet with an initial flow of 477,000 cubic feet daily. The volume of dry gas produced was 4.5 times the total for 1959. Crude oil and wet gas output increased 4 and 3 percent, respectively, whereas production of natural gasoline and cyclic products and LP-gas from six plants rose 10 and 9 percent. Two new cycling plants of Standard Oil Co. at Carpenteria and Gaviota contributed substantially to the increase in natural gas liquids.

Open-pit operations at Lompoc supplied a high percentage of California's diatomite output. The crude material was prepared for a wide variety of uses in the nearby processing plants of Great Lakes

Digitized by Google

Carbon Corp., Johns-Manville Products Corp., and Wyandotte Chemical Corp. Much of the finished diatomite was consumed as a filter aid and filler or carrier in various products, and for thermal and acoustic insulation. Near Santa Maria, The Airox Co. mined and prepared diatomite for use as lightweight aggregate and as an ingredient in pozzolan cement.

The peak construction period for facilities at Vandenberg Air Force Base had ended, and demand for aggregate was appreciably less than in 1959. However, much of the sand and gravel and stone production was used in constructing related projects at the base, for roads and buildings at the Naval Missile Facility at Point Arguello, and for improvements to U.S. Highway 101, west of Santa Barbara. The principal producers of sand and gravel operated fixed and portable plants along the Sisquoc River in the Santa Maria-Garey-Sisquoc area and along the Santa Ynez River in the Lompoc-Buellton-Solvang area. Missile City Rock Corp. quarried dolomite in Miguelito Canyon, near Lompoc, and produced dimension and crushed stone used in structures and roads. Rough and dressed building stone, riprap, and flagging were quarried near Santa Maria, Lompoc, and Santa Barbara. In June, Rincon Rock Corp. installed equipment at its quarry near Carpenteria for preparing stone used in building and paving. De Weese Spreaders, Inc., mined agricultural gypsite one-half mile south of Ventucopa during the first half of 1960. The company ceased mining in July when the deposit was depleted of salable mineral.

The Gibraltar mine northeast of Santa Barbara, was the only active mercury property. Some underground development rock was furnaced, but most of the recovered metal came from ore mined at the producer's open-pit operation.

**Santa Clara.**—The 6-kiln wet-process cement plant of Permanente Cement Co. at Permanente was the State's largest cement-producing facility. The plant used over 143 million kilowatt-hours of electrical energy during the year. Shipments of virtually all types of cement, including some white and masonry cements, were made to consumers in California, Nevada, Oregon, Washington, Hawaii, and foreign countries. The construction of interchanges and extensions along U.S. Highway 101 Bypass and State Highway 17 to provide continuous freeway routes through the county placed heavy demands on many sand and gravel producers. Virtually all the sand and gravel used for building and road construction was obtained from streambed deposits in Coyote, Guadalupe, Los Gatos, and Uvas Creeks, and bench gravels along Stevens Creek Road west of San Jose. The county's largest stone quarry was at Permanente, where limestone for cement and road base was processed at two crushing plants. Other stone quarries were worked near Milpitas, Palo Alto, Los Altos, San Jose, Saratoga, Morgan Hill, and Gilroy for rubble, aggregate, roadstone, roofing granules, and fill. Road base material was obtained from the Alum Rock Park and Saratoga quarries by crews of the City of San Jose and Santa Clara County, respectively. Oystershell dredged from San Francisco Bay near Dumbarton Bridge was used as poultry grit and mineral filler in animal feeds. The Western quarry near Livermore was the source of magnesite used by an

Digitized by Google

Alameda County chemical plant in producing hydrous magnesium sulfate. Late in the year Mother Lode Rock Industries, Inc., took over operation of the quarry. Remillard-Dandini Co. and Gladding Bros. Manufacturing Co. mined miscellaneous clay near San Jose for use in making brick and flue lining.

The Guadalupe and New Almaden mines were the only producing mercury properties. Dump material was worked at the New Almaden by 10 lessees, only half the number working in 1959. One of the lessees recovered nearly 700 flasks of mercury. As in 1959, only two oil wells were active. The wells, in the old Moody Gulch field, yielded 33 percent less crude oil than in 1959.

**Santa Cruz.**—Pacific Cement & Aggregates, Inc., operated a 9-kiln dry-process cement plant at Davenport and produced general purpose and moderate heat portland cements for northern California customers. Nearly 60 million kilowatt-hours of electrical energy was used. Shipments were made of both bulk and bagged cement by truck and rail. Pacific Cement mined shale from its nearby quarry, and Ideal Cement Co. operated the Chittenden shale quarry, for raw material used in manufacturing cement. Flue dust from the Davenport cement plant was sold for fertilizer because of its potash content. Sand and gravel was mined principally from the unconsolidated Santa Margarita formation. At Felton, sand was blended with crushed stone and used as concrete aggregate. Several producers worked sand deposits in the Santa Cruz and Scott Valley areas. Sandstone quarried at Davenport and hauled to San Mateo County for constructing the 7,000-foot L-shaped breakwater at Half Moon Bay chiefly accounted for the increase in stone production compared with 1959. Limestone quarried at Davenport and Santa Cruz was used in manufacturing cement, as rubble, and for poultry grit. Stone was quarried near Felton and Soquel by crews and contractors for State and county road agencies.

Union Oil Co. of California terminated its research project for recovering hydrocarbon from bituminous sandstone near Santa Cruz. The project was begun in 1955 by Husky Oil Co. High recovery cost was the principal factor in the decision to abandon the project.

**Shasta.**—Sand and gravel was produced principally by dragline along the Sacramento River and from stream-bed deposits on Churn and Clear Creeks near Redding. Demand was high for concrete aggregate and base material for water-tunnel linings, powerplant construction, and road relocation in preparation for the proposed Whiskeytown Dam and adjacent saddle dams. By yearend, the Clear Creek tunnel had been holed through and work begun on the Spring Creek tunnel, the Whiskeytown Dam and two of three major powerplants. Basalt and miscellaneous stone were quarried by Government crews and contractors for use as riprap and roadstone. Calaveras Cement Co. was building a new $14 million, 1.5-million-barrel annual capacity, automated cement plant about 10 miles north of Redding. Development of the limestone deposit in the Grey Rocks Hills northeast of the plant site began in December, with plans for a belt conveyor adit and a vertical shaft for use as an ore pass. All volcanic cinder produced in the county was used for road construction. Most of the material came from deposits near Glenburn and Fall River

Digitized by Google

Mills, although crews and contractors for the State Division of Highways produced some for their own use from deposits in the Shasta National Forest.

Mountain Copper Co., Ltd., mined pyrite from its Iron Mountain pit west of Matheson Station and recovered cement copper from underground mine water. The pyrite was crushed and shipped to Contra Costa County chemical plants, where the mineral was roasted to recover sulfur used in making sulfuric acid. The resulting cinder was used in manufacturing special cements and as a soil supplement. The cement, copper, and solution-residues from the company's chemical plant were shipped to the copper smelter in Tacoma, Wash., for extraction of copper, gold, silver, and lead. During the year the company stripped and removed nearly 1 million tons of waste at its Iron Mountain property and completed over 1,750 feet of diamond drilling. A few miles north, about 5,000 feet of diamond drilling was done in exploring the Balaklala copper mine, but no ore was mined or shipped. Five lode gold mines were active; the Yankee John about 6.5 miles southwest of Redding on the Igo road, Washington near French Gulch, and the El Dorado near Towerhouse were the most productive.

**Sierra.**—Seven lode gold mines were active; however, only three—the Brush Creek south of Goodyears Bar, the Original 16 to 1 at Alleghany, and the El Dorado (El Dorado-Plumbago) east of Alleghany—yielded appreciable quantities of gold and silver. The El Dorado ore also contained recoverable zinc. Considerable exploration and development work was done at these mines and the Plumbago southeast of Alleghany. The work consisted of shaft, drifts, tunnels, raises, and drilling. Gold and silver, recovered by dragline dredging in 1958 and 1959 on the Espy Placer property near Pike, were sold in 1960. Placer gold and silver were recovered by small-scale hand equipment in stream and ancient river bed gravels in the Poker Flat, Pike, and Alleghany areas. Old tailings were washed at the Two Bills site on Illinois Creek north of Downieville; relatively small quantities of gold and silver were recovered. Test work at the Desert Hill prospect south of Pike yielded some placer gold. Uranium ore was shipped from the Silver Streak mine in Dog Valley to a processing plant at Lakeview, Oreg. The mine had yielded shipping-grade ore in 1958.

All the sand and gravel and most of the stone produced was used in road construction by crews and contractors for Federal, State, and county agencies. The commercial requirements for building and paving sand and gravel were supplied by producers in neighboring counties. Reno Silica Co. quarried quartz (July through September) several miles north of Crystal Peak and shipped it to an Oregon silicon manufacturer.

**Siskiyou.**—A substantial tonnage of sand and gravel was produced by county, State, and Federal crews and contractors for constructing bridges and roads in the Weed, Yreka, Seiad Valley, Clear Creek, and Callahan areas. Commercial preparation plants were operated by Mt. Shasta Gravel Co., Inc., at an alluvial deposit 2 miles northwest of Mt. Shasta, and by A. Young of Yreka, who obtained gravel from the Greenhorn Creek stream bed and sand from Whitney Creek.

Digitized by Google

The materials were used for building and paving. Basalt and miscellaneous stone were used for riprap and roadstone by contractors for the U.S. Forest Service and Bureau of Reclamation. Siskiyou Stone Co., Inc., of Yreka quarried ornamental building stone near Montague, where the company was building a plant. More than half the output of volcanic cinder, all used for railroad ballast, came from the Kegg cinder pit. Deposits near the Modoc County line yielded pumice and volcanic cinder for lightweight aggregate, landscaping material, road base, and fill. Lesser quantities of volcanic cinder were used in the maintenance and repair of county, State, and Federal roads.

Five lode gold mines were active. The Siskon mine near Happy Camp yielded a high percentage of the lode gold and silver produced. Ore from this mine was cyanided to recover the precious metals. The operator stripped about 50,000 tons of waste from the open pit deposit and completed 300 feet of exploratory diamond drilling. Copper ores from the Cornucopia mine west of Callahan and a prospect on the Fay property southeast of Etna were shipped to the Tacoma (Washington) smelter for recovery of copper, gold, and silver. Except for two dragline operations near Happy Camp and one at Deadwood west of Yreka, placer gold and silver was produced by small-scale hand methods on the Klamath, Scott, and Salmon Rivers.

**Solano.**—A nearly 25-percent increase in volume of dry gas over 1959 was due largely to an average of 24 more producing wells and three new gas discoveries. G. E. Kadane & Sons made a new field (Bunker) discovery June 4 with a gas well completion 2.5 miles northwest of the Maine Prairie gasfield. Initial flow was 3,425,000 cubic feet from a depth of 6,831 feet. On July 16 Standard Oil Co. of California made a new gas pool discovery in the Cache Slough gasfield. Production came from a 2-foot interval at 5,341 feet with an initial flow of 3,850,000 cubic feet daily. Reserve Gas & Oil Co. completed a gas well on December 15 about 2.5 miles north of the Cache Slough gasfield reported as a new gasfield (Liberty Island). Initial flow from three producing intervals was reported at 3,900,000 cubic feet daily through a three-eighth-inch bean with a pressure of 1,400 pounds per square inch. The first crude oil production in the Sacramento Valley was recorded in the Winters gasfield by Texaco, Inc. The well was originally completed as a gas well near the 5,000-foot depth in Cretaceous sands but later began producing oil at an average rate of 79 barrels daily. A second test of the same zone found gas that flowed at an initial daily rate of 2,970,000 cubic feet. The Rio Vista gasfield in Solano and Sacramento Counties had the largest production in the State, yielding 187 million cubic feet per day, 19 million cubic feet more than in 1959.

Basalt Rock Co., Inc., the leading producer of expanded shale in the State, mined raw material from the Chabot pit near Vallejo and furnaced it for use as lightweight aggregate. Basalt Rock obtained some raw material in excavating a road to a new shale source in Napa County. The tonnage of stone quarried near Benicia, Vallejo, Suisun, and Thomasson was substantially above that of 1959 because of extensive requirements for 4- and 6-lane highways near the quarry

Digitized by Google

sites. Sand and gravel was produced near Vacaville and Winters; however, much of the material for paving projects, particularly sand, was supplied by producers outside the county.

A comparatively small quantity of mercury was recovered from ore mined at the Brownlie property near Vallejo.

**Sonoma.**—Sand and gravel production for building and road construction increased about 500,000 tons over 1959. An appreciable part of the total output came from stream-bed deposits along the Russian River in the Cloverdale, Healdsburg, Windsor, and Mirabel Park areas. Basalt Rock Co., Inc., the county's major sand and gravel producer, supplied most of the aggregate used in freeway construction near Healdsburg. Road projects near Santa Rosa, Jenner, and Monte Rio, and school and residential construction were major markets for sand and gravel and stone. Stone quarries in the southern part of the county near Forestville, Occidental, Petaluma, and Sonoma were the principal sources for riprap in levee embankments and base material in roads. Dimension stone was quarried near Glen Ellen for building and wall rock, and flagging. Shale from the Mark West quarry near Santa Rosa was used as fill.

Three mercury mines were worked during the year; the Mt. Jackson, near Guerneville; the Culver-Baer (Buckman), in the Geyser area; and the Mercury Bank, near Healdsburg. The Mount Jackson mine was the State's second largest mercury producer. The Buckman mine was sold in April to Alex Rorabaugh and Swen Gummer of Cloverdale by Buckman Laboratories, Inc.

Although one potential producing well was added to the Petaluma gas field in 1960, as in 1959 an average of only three gas wells produced during the year. However, dry-gas output rose 30 percent.

**Stanislaus.**—The tonnage output of sand and gravel increased compared with 1959, chiefly to supply aggregate for building and paving projects in Stanislaus County and adjacent counties. Production came mainly from fixed and portable plants along the Tuolumne River near Modesto, Hughson, and Waterford; the Stanislaus River near Riverbank, Oakdale, and Knights Ferry; and Orestimba Creek near Newman. Dimension stone for building construction was quarried near Knights Ferry. Ball clay, fire clay, and miscellaneous clay were mined by E. H. Metcalf near Oakdale, Western States Minerals Co. and Clayton & Lester Raggio in the Knights Ferry area, and Kraftile Co. near LaGrange. The clays were used in sanitary ware, pottery, stoneware, heavy clay products, and rotary drilling muds.

Manganiferous ore from the Buckeye mine in the Mount Oso area was shipped to an Arizona mill for upgrading and eventual consumption by a California steel producer. Cinnabar ore from the Adobe underground mercury mine near Patterson was retorted to yield a small quantity of the metal. Virtually all the gold and silver were recovered as byproducts at a sand and gravel dragline operation on the Tuolumne River southeast of Waterford.

**Sutter.**—A slight increase in natural gas output over 1959 was attributed to two new gas discoveries late in the year. Buttes Gas & Oil Co. discovered the Natomas gasfield near the Sacramento County line with a well completion on December 1. Production was reported from Cretaceous sands at 3,240 feet with an initial flow of 800,000

Digitized by Google

cubic feet daily. On November 21, Atlantic Oil Co. made a new gas pool discovery in the Grimes field. The well was drilled to a depth of 8,020 feet with production at 6,760 feet, also in Cretaceous sands. Daily initial flow was reported at 5,250,000 cubic feet. Despite these discoveries the average number of producing gas wells was one less than in 1959 although the number of potential producers increased by two.

Most of the sand and gravel required for use in the county that had to meet State specifications was obtained from neighboring counties, principally from producers along the Yuba River in Yuba County. Output in Sutter County was limited chiefly to sand and gravel produced from volcanic detritus deposits near Sutter Buttes. Lesser quantities of these materials were obtained at Shanghai Bend on the Feather River near Yuba City and from stream bed gravels of the Bear River near Nicolaus. Stone for road base was quarried near Sutter Buttes by county road crews. Gladding, McBean & Co. dug clay near Nicolaus and used it in manufacturing vitrified sewer pipe.

**Tehama.**—Public works projects, including roads and structures for the Bureau of Reclamation and the U.S. Army Corps of Engineers, required more than 650,000 tons of sand and gravel. Much of the production was supplied by operators along the Sacramento River near Red Bluff, at Elder Creek near Gerber, and on Thomas Creek near Richfield. Miscellaneous stone was quarried and prepared for use as riprap and roadstone by crews and contractors for the U.S. Forest Service. Crews of State and Federal agencies mined volcanic cinder used in road construction.

On April 2, Buttes Gas & Oil Co. made a new shallower pool gas discovery in the northeast part of the Corning gas field. The well, the shallowest ever drilled in the area, produced from the 1,086 to 1,101 interval in Tehama B sands of Pliocene age. This sand had been noted previously in nearby wells but had never been opened to production. Initial flow from the discovery well was 8 million cubic feet of 720 B.t.u. gas through a 1-inch bean. Later, Superior Oil Co. recompleted two wells in the same pool. An average of one less producing well yielded 6 percent less natural gas than in 1959, yet the number of potential producers at yearend 1960 had been increased by five.

A relatively small tonnage of maganiferous ore was upgraded in an Arizona mill and sold to a California steel plant.

**Trinity.**—Most of the sand and gravel and stone produced was utilized in realinement of highways and as riprap and surface rock at the Trinity Dam. The dam reached its ultimate height of 537 feet during the year, making it the highest earthfill dam in the world. Other construction features of the $257 million project, such as powerplants and tunnel linings, also required substantial tonnages of concrete aggregate. These materials were supplied by Government contractors and a commercial preparation plant at Weaverville. Riprap was produced from a stone quarry near Island Mountain for railroad embankments. Volcanic cinder was mined in the National Forest for use in road construction.

Although the Altoona mine in the Castle Creek area was the major source of mercury, ore from the nearby Hub property was retorted

Digitized by Google

to recover a small quantity of the metal. Ores from prospects near Junction City and southeast of Hayfork yielded a few ounces of gold and silver. A suction dredge was operated on the north fork of the Trinity River upstream from Helena, and stream-bed gravels of Crow Creek in Cinnabar Gulch were worked by hydraulicking; however, a high percentage of the placer gold and silver was recovered by prospectors, using small-scale hand methods.

**Tulare.**—The output of natural (dry) gas was down 1 percent and that of petroleum was up 2 percent compared with 1959. An average of five more gas wells were producing in 1960, but the average number of producing oil wells remained unchanged. Production came from the Trico gasfield, lying partly in Kern and Kings Counties, and the Deer Creek oilfield.

Substantial tonnages of sand and gravel and stone were used in constructing the Terminus Dam near Lemon Cove and the Success Dam near Porterville, and related construction projects including relocation of roads. Virtually the entire stone output used for riprap, fill, and road base was quarried by Government contractors from deposits near the projects sites. Commercial sand and gravel preparation plants in the Lemon Cove, Porterville, and Woodlake areas supplied a large percentage of the asphalt and concrete aggregate used in roads and structures at the dams, as well as material for highway construction in the Visalia and Strathmore areas. S. P. Brick Co. dug miscellaneous clay near Exeter for use in its Fresno County brick plant.

Barite was mined from the Macco Corp. property in 9-mile Canyon and the nearby deposit of Southwest Minerals, Inc. Most of the crude mineral from both mines was processed at the Macco plant at Rosamond, Kern County. A lesser tonnage of the raw mineral was upgraded before shipment by jigging by Macco Corp. at Linnie Station, Inyo County.

**Tuolumne.**—A relatively large tonnage of granite was excavated from the Cherry Reservoir tunnel and crushed for concrete aggregate and road base by contractors for the Hetch Hetchy water and power project. Quarries near Twain Harte, Strawberry, and Buck Meadows supplied stone used for riprap, aggregate, roadstone, and roofing granules. Several stone quarries near road projects of Federal agencies were worked by Government crews and contractors for riprap and other road construction uses. Limestone from the Sonora quarry was used in sugar refining, animal feeds, manufacture of paper and lime, and for various other purposes. The Columbia limestone quarry was idle. Marble quarried in the Sonora area was crushed for terrazzo. Portable plants along the Tuolumne River prepared sand and gravel for use in paving sections on State Highways 108 and 120. U.S. Lime Products Division, The Flintkote Co., operated three shaft-type kilns, one rotary kiln, and a batch hydrator at Sonora and produced quicklime and hydrated lime for various chemical and industrial uses, including agriculture and the building trades.

The Fenton group of claims and the Tuolumne prospect near Big Oak Flat yielded comparatively small tonnages of gold ore containing recoverable gold and silver.

Digitized by Google

**Ventura.**—Crude oil and natural (wet) gas production declined 6 and 5 percent, respectively, despite a rise in average number of producing oil wells from 3,020 in 1959 to 3,079. Two new oil pool discoveries were made during the year, both by Texaco, Inc. The first resulted from a well completion on July 4 in the Bardsdale oilfield with an initial daily flow of 258 barrels of 32.4° API gravity and 202,000 cubic feet of wet gas. The second was made in the Shields Canyon oilfield on October 3 when the Shields No. 202 well was brought in. This well produced from a 123-foot interval beginning at 7,171 feet. The initial daily flow was 565 barrels of 31.8° API gravity oil and 243 thousand cubic feet of wet gas. In the Saticoy oilfield, Shell Oil Co. extended production limits about 2,000 feet to the northeast, and Union Oil Co. extended the productive limits of the Bardsdale oilfield 700 feet to the west when it completed a 140-barrel-a-day pumper. Richfield Oil Corp. completed a development drilling program on its offshore man-made island in the Rincon oilfield, with 46 directionally drilled wells. A unitized waterflooding program was begun in the Oligocene zone of the Shields Canyon field. The number of refineries remained unchanged, with two asphalt and one skimming and asphalt at Oxnard, and one skimming plant at Ventura. The number of natural gasoline and cycle plants increased by one when Richfield Oil Corp. completed its Rincon Island No. 24 near Ventura. Output of natural gas liquids from these plants was virtually unchanged for natural gasoline and cyclic products but declined 26 percent for LP-gas from 1959. Dry-gas production, from one less producing well, decreased 13 percent. Near the beginning of the year a 10-inch, 12-mile, cement-lined waste-water line was completed between the Saticoy oilfield and the City of Oxnard industrial waste plant. The cost was approximately $475,000; brine capacity was 6,000 barrels daily. The participating companies were Shell Oil Co., Socony Mobil Oil Co., Inc., and The Superior Oil Co.

Stone was quarried near Camarillo and Oxnard for riprap used principally in the construction of a breakwater near Ventura, material in levees and enbankments along the Santa Clara River, and base material in road construction. Explosives, a ripper, and a tractor were used to mine decomposed oystershell at the Tapo Alto quarry near Santa Susana. The material was prepared for use as an ingredient in fertilizers, a mineral filler in animal feeds, and poultry grit. Dimension sandstone was quarried near Ojai for rubble and flagging. Sand and gravel preparation plants in the El Rio, Saticoy, and Santa Paula areas, supplied much of the concrete aggregate used at the Naval Missile Center, Point Mugu for runways, streets, and roads. Ridgelite Products, Inc., and Rocklite Products, Inc., produced lightweight aggregate shale from shale mined near Frazier Park and Ventura, respectively. Monolith Portland Cement Co. quarried gypsum from its Cuyama deposit 25 miles south of Maricopa and consumed the crude mineral in its Kern County cement plant.

**Yolo.**—Most of the sand and gravel produced was used in constructing and maintaining State and county roads, and city streets. The major producers operated fixed preparation plants along Cache Creek in the Madison and Woodland areas, near most of the paving projects.

Digitized by Google

Some of the sand and gravel was used by crews and contractors for Solano and Sutter County road agencies.

A more than 12-percent volume increase in natural (dry) gas output compared with 1959, was attributed to an average of four more producing wells, and to a new pool discovery by Artnell Co. in the Dunnigan Hills gasfield. The discovery resulted from a well completion on May 4 that produced from two intervals: The Sub-Hermle pool at 3,064 to 3,065 feet and the Forbes pool at 3,077 to 3,087 feet. Initial daily flow from the Sub-Hermle pool was 1,690,000 cubic feet and that from the Forbes pool, 2,250,000 cubic feet.

The Reed mine, near the county line west of Rumsey, yielded cinnabar ore that was retorted to recover more than 100 flasks of mercury. Activity at this mine had been limited to exploration in 1959.

**Yuba.**—California's major placer-gold operation was that of Yuba Gold Fields Division, Yuba Consolidated Industries, Inc., which operated four bucketline dredges on the Yuba River near Marysville. A high percentage of the placer gold, silver, and platinum recovered in the State was credited to this operation. Electrosonic Mining & Equipment Co. operated an electrostatic unit in the same area on dredge tailings and recovered gold and silver. Henry M. Michael operated a nonfloat washing plant on placer tailings at Rock Island Bar, 10 miles east of Challenge, and recovered a few ounces of gold and silver. Numerous prospectors worked stream gravels by small-scale hand methods in the Brownsville, Camptonville, and Smartville areas and produced relatively small quantities of placer gold and silver. Virtually all lode gold and silver produced in the county was recovered by amalgamation and flotation from ores of the Browns Valley group of claims (Dannebroge mine), in Browns Valley. The flotation concentrate also contained recoverable copper.

Sand and gravel produced from stream-bed gravels and dredge tailings along the Yuba River near Marysville was prepared in portable and fixed plants, principally for concrete aggregate and road base. Some river sand was prepared for blast, engine, filtration, and stock car uses. A contractor supplied the U.S. Army Corps of Engineers with riprap for levees and embankments. Gladding, McBean & Co. mined miscellaneous clay near Wheatland that was used by the producer in manufacturing sewer pipe.

# The Mineral Industry of Colorado

By M. H Howes [1]

A HIGHER output of petroleum—Colorado's major mineral product—together with a substantial increase in metals production offset a decrease in nonmetals yield; the overall mineral value for the State reached a new record in 1960. Minerals produced were valued at $342.2 million, 9 percent above the $314.7 million value in 1959 and $3.7 million greater than the 1957 record of $338.5 million. The principal commodities in the metals group again were molybdenum and uranium; the primary nonmetals were cement and sand and gravel.

Mineral fuels represented 52 percent of the value of mineral production—3 percent more than in 1959. Petroleum, which supplied 40 percent of the total value, increased 2 percent both in quantity and value of production as the result of an extensive secondary-recovery program at several Colorado fields and new production from the Denver-Julesburg basin. Coal production rose 10 percent because of an increase in electric power generation and a greater demand for Colorado coal in the Utah steel industry. The $21.1 million value for coal represented 6 percent of the value of the State's mineral production.

Metals furnished 36 percent of the value of minerals production—26 percent more than in 1959—and increased in value from $97.3 million in 1959 to $122.5 million in 1960.

Prices of copper, lead, and zinc were higher than in 1959. A decrease in zinc production was offset by a substantial increase in output of copper, lead, and silver, and a slightly higher output of gold. The total value of these five metals was $18 million, a gain of 11 percent over 1959, compared with an 8-percent decrease from 1958 to 1959.

The most significant declines in output and value among the 14 nonmetals produced in Colorado were in commodities most important to the construction industry, specifically cement, sand and gravel, and stone. Nonmetals production, 10 percent below the 1959 value, supplied 12 percent of the value of all minerals produced.

Production started at the Camp Bird mine and mill in Ouray County during October 1960 after 4 years of development and construction.

American Smelting and Refining Co. (Asarco) announced that its Arkansas Valley lead smelter at Leadville would be shut down early in 1961 because of a decreasing ore supply.

| Value of items that cannot be disclosed: Cement, feldspar, fluorspar, lime, molybdenum, perlite, pyrites, salt, tungsten concentrate, and values indicated by footnote 5..... | ---- | [6] 79,216 | ---- | 99,743 |
| Total Colorado[6]..... | ---- | [6] 314,677 | ---- | 342,223 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Revised figure.
[3] Value not reported.
[4] Preliminary figure.
[5] Data withheld to avoid disclosure of individual company confidential data.
[6] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.

To replace or expand existing equipment, the Colorado Fuel and Iron Corp. (CF&I) started installation of new oxygen steelmaking facilities at Pueblo capable of producing 600,000 tons of steel per year.

American Gilsonite Co. announced plans to double its plant capacity at Fruita.

An application by Public Service Co. of Colorado (PSC) for permission to store natural gas in the abandoned Leyden coal mine near Denver, to relieve peak loads in the Denver metropolitan area, was approved by the Oil and Gas Conservation Commission of Colorado September 30, 1960.

Research on rock mechanics as applied to ground control was conducted at the Denver Mining Research Center of the Federal Bureau of Mines. A report on geologic factors related to block caving was published.

[illegible] Bureau of Mines Rept.

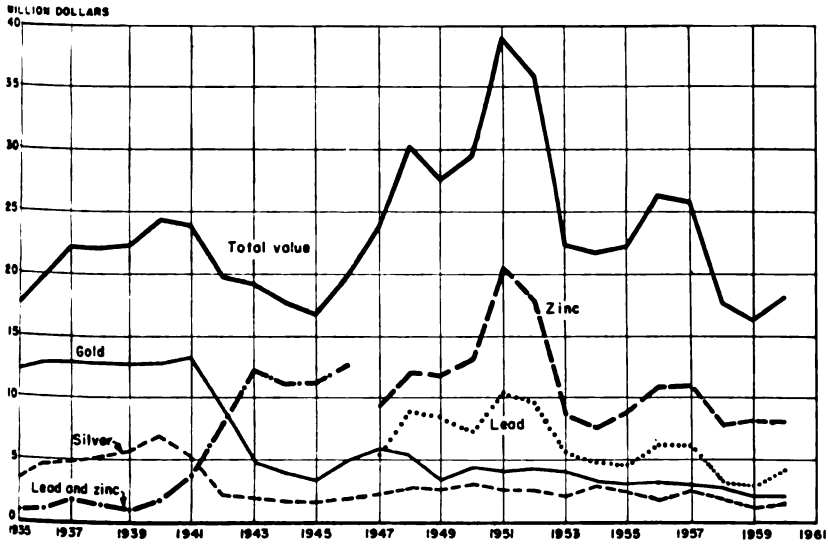

FIGURE 2.—Value of mine production of gold, silver, lead, and zinc and total value of these minerals (including copper) in Colorado, 1935–60.

**Employment and Injuries.**—Preliminary employment and injuries data (excluding the petroleum industry) are shown in table 2. The coal and coke industry contributed 30 percent of the total man-hours worked and 2 of the 10 fatal injuries in Colorado's mineral industry.

Digitized by Google

TABLE 2.—Employment and injuries in the mineral industries[1] in 1960[2]

| Industry | Number of operations | Average number of men employed | Total man-hours worked | Injuries | | Frequency rate (injuries per million man-hours) |
|---|---|---|---|---|---|---|
| | | | | Fatal | Nonfatal | |
| Nonferrous mines and smelters (excluding uranium) | 91 | 1,707 | 2,944,928 | ---------- | 196 | 66.6 |
| Uranium | 422 | 3,065 | 5,893,272 | 6 | 218 | 38.0 |
| Ferrous | 5 | 1,268 | 3,608,008 | ---------- | 70 | 19.4 |
| Sand and gravel | 207 | 1,366 | 2,058,209 | ---------- | 27 | 13.1 |
| Stone | 89 | 621 | 1,201,219 | ---------- | 26 | 21.6 |
| Other nonmetals | 121 | 599 | 923,568 | 2 | 42 | 47.6 |
| Coal and coke | 120 | 2,838 | 7,038,004 | 2 | 152 | 21.9 |
| Total | 1,055 | 11,464 | 23,670,208 | 10 | 731 | 31.3 |

[1] Excludes petroleum.
[2] Preliminary figures.

The uranium industry accounted for 25 percent of the total man-hours worked and 6 of the 10 fatalities.

**Legislation and Government Programs.**—Exploration for copper-lead-zinc was continued by Clear Creek Mining Co. at Idaho Springs, Clear Creek County, under an Office of Minerals Exploration (OME) contract executed in 1959. No OME contracts were executed in Colorado in 1960.

A small quantity of high-grade beryllium concentrate mined in the State was shipped to the Government purchase depot at Custer, S. Dak.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

**Asphalt and Related Bitumens.**—Gilsonite from Utah continued to be processed by American Gilsonite Co. at its plant near Fruita. The company announced plans to double the plant capacity by installing additional dewatering facilities, another coking furnace and steam boiler, tanks, flotation cells, increased power facilities, and an additional railroad spur. A fuel oil equal to or superior to similar oils derived from crude petroleum, for use in diesel-powered locomotives, was developed by the company. The use of this oil in locomotives between Denver and Salt Lake City, Utah, was particularly economical to the Denver & Rio Grande Western Railroad because the plant, approximately halfway between the cities, relieved the railroad of providing large diesel fuel storage facilities at these terminals.

**Carbon Dioxide.** Carbon dioxide production from wells in Las Animas and Montezuma Counties decreased 11 percent. The gas was transported through pipelines to plants in Bent and Montezuma Counties, where it was processed into dry ice and liquid carbon dioxide. [illegible] carbon dioxide from all wells was vented.

[illegible] of 11 percent in the production of coal resulted [illegible] power [illegible] and larger consumption of [illegible]. In December, C F & I permanently [illegible] production from its [illegible] Mines. Two basic oxygen con-

[1] Value received or charged for coal f.o.b. mine, including selling cost. (Includes a value for coal not sold but used by producer, such as mine fuel and coal coked as estimated by producer at average prices that might have been received if such coal had been sold commercially).

[2] Production of Moffat, Montrose, and Pitkin Counties combined with El Paso County to avoid disclosing individual company confidential data.

[3] Figure withheld to avoid disclosing individual company confidential data.

[4] Production of Montrose and Pitkin Counties combined with Moffat County to avoid disclosing individual company confidential data.

verters were being installed at the CF&I Pueblo plant. A new technique in blast-furnace operation was started wherein natural gas was used as a supplemental fuel to lower the quantity of coke required to reduce iron from the ore. Several power companies planned to use coal as a fuel in reported expansion of their power generating capacity.

The Federal Bureau of Mines continued its long-range investigations of coal use at its Denver Coal Research Laboratory. Studies included entrained-state carbonization of bituminous coal and lignites; coking properties of selected western coals; binderless briquetting of lignite; and staticbed, pressurized, and swept-bed carbonization assays. The research effort was concerned partly with the investigation of the yields and properties of low-temperature tar. A report [3] by a coal as a fuel in reported expansion of their power-generating staff member of the Denver Coal Research Laboratory was published.

**Natural Gas.**—The value of marketed natural gas from well in 16 counties and residual gas from natural gasoline plants in 8 counties increased 16 percent. New gas discoveries were made in 14 fields in 9 counties. The gas was piped to consumers.

On September 30, the Oil and Gas Conservation Commission of Colorado granted approval to Public Service Co. of Colorado (PSC) to use the abandoned Leyden coal mine 7 miles northwest of Arvada for natural gas storage—a measure to augment the supply of gas dur-

[3] Gomez, Manuel, Pyrolysis of Coal: Ind. and Eng. Chem., vol. 52, August 1960, pp. 717–720.

Digitized by Google

ing the peak-use consumer demand from the Denver metropolitan area. In its testing program, PSC theorized that 3 billion feet of gas could be stored safely in the cavity at a pressure of 300 pounds per square inch. As of September 30, testing, in progress since September 1959, continued with the injection of 350 million cubic feet of gas at a pressure between 100 and 200 pounds per square inch.

**Natural Gas Liquids.**—Natural gasoline, propane, and butane were recovered from wet petroleum gases at plants in Adams, La Plata, Logan, Moffat, Morgan, Rio Blanco, Washington, and Weld Counties. The quantity of natural gasoline recovered was 54 percent greater than in 1959; the quantity of propane and butane recovered increased 34 percent.

**Peat.**—Peat humus production, from Boulder, Gilpin, and Teller Counties, increased 41 percent. The peat was used as an admixture in fertilizers and as a soil conditioner.

**Petroleum.**—Production of petroleum, from 237 fields in 18 counties, increased 2 percent, thus reversing a downward trend. Waterflood projects together with new production from the Denver-Julesburg basin supplied the increase. The extensive secondary-recovery program by waterflooding and gas injection at the Rangely field continued as planned. Although production was 3 percent less than in 1959, the output of 17 million barrels from the field furnished 36 percent of the petroleum produced in the State. The Adena field in Morgan County, second only to Rangely, produced 7.6 million barrels, a gain of 16 percent. The gain was attributed mainly to waterflooding. More than 40 million barrels of petroleum had been produced from the Adena field since its discovery in 1953. Increased production from other fields was attributed largely to secondary recovery. Waterflooding was being conducted at 18 eastern Colorado fields at yearend and had been approved, but not started, at 6 other fields.

**TABLE 4.—Crude petroleum production, by counties[1]**

(Thousand barrels)

| County | 1959 | 1960[2] | Principal fields in 1960 in order of production |

[2] Includes 3 condensate-well completions.
[3] Includes 6 condensate-well completions.
[4] Includes 9 condensate-well completions (3 wildcat, 6 development).

Source: Oil and Gas Journal.

Total drilling declined from 809 completions and 4.2 million feet in 1959 to 706 completions and 3.5 million feet. During 1960 there were 24 oil and 23 gas-well discoveries. Development drilling resulted in 104 oil and 93 gas wells. More than half of the successful exploratory and development wells were drilled within the Denver-Julesburg basin.

**Shale Oil.**—Two publications [4] describing investigations of oil shale were released.

## METALS

**Beryllium.**—Increasing interest in beryllium resulted in a 38-percent increase in sales of beryllium concentrate. A 21-percent decline in the value of production was caused by a decrease from 7.73 to 5.66 percent in the average BeO content of the concentrate. All of the concentrate containing plus-8-percent BeO came from pegmatites in

[4] Matzick, Arthur, Dannenberg, R. O., and Guthrie, Boyd, Experiments in Crushing Green River Oil Shale: Bureau of Mines Rept. of Investigations 5563, 1960, 64 pp.
Stanfield, K. E., Smith, J. W., Smith, H. N., and Robb, W. A., Oil Yields of Sections of Green River Oil Shale in Colorado, 1954–57: Bureau of Mines Rept. of Investigations 5614, 1960, 186 pp.

Larimer, Chaffee, Fremont, Mesa, Park, Gunnison, and Jefferson Counties. Virtually all the minus-8-percent concentrate was produced by U.S. Beryllium Corp. from its Boomer Lode and Redskin mine, both in the Badger Flats area, Park County. In the past the Government purchase depot at Custer, S. Dak., was the principal market for beryl with a minimum BeO content of 8 percent. In 1959, the purchase depot received 123 tons of the 221 tons of concentrate produced. Output for 1960 was 265 tons of minus-8-percent BeO and 39 tons of plus-8-percent BeO concentrates. Of the 1960 production, only 14 tons of plus-8-percent BeO material was shipped to Custer; the remainder was purchased by Mineral Concentrates & Chemical Co., Inc. (Mincon), Loveland, and Beryl Ores Co., Arvada. Both of these companies were equipped to process beryllium ore or concentrate, even in small lots.

A beryllium occurrence in Larimer County was described.[5]

**Cadmium, Indium, and Thallium.**—Asarco recovered cadmium, indium, and thallium from flue dust, dross, and other byproduct material shipped from other company smelters to its Globe smelter at Denver.

**Copper.**—Production of copper increased 10 percent, and its value increased 16 percent compared with that of 1959. The principal copper producer in the State was the Idarado Mining Co. that operated

**TABLE 6.—Mine production of gold, silver, copper, lead, and zinc, in terms of recoverable metals[1]**

Eagle mine in the *Red Cliff* district, Eagle County. Output decreased 36 percent below that of 1959 because of a strike at the mine that lasted from August 5 to November 25.

**Gold.**—Production of gold was 61,269 troy ounces valued of $2.1 million, about the same as in 1959. The leading producer was The Golden Cycle Corp. at its Ajax mine in *Cripple Creek* district, Teller County, followed by the Idarado Mining Co., at its Treasury Tunnel-Black Bear-Smuggler Union group of mines in *Upper San Miguel* district, San Miguel County. Other leading producers were The New Jersey Zinc Co. at its Eagle mine in *Red Cliff* district, Eagle County; and The United Gold Mines Co. at its United Gold mine and Deadwood Leasing Co. at its Free Coinage mine, both in *Cripple Creek* district, Teller County. Although gold was mined in 20 counties, 51 percent of the output came from 12 mines in Teller County.

**TABLE 8.—Mine production of gold, silver, copper, lead, and zinc in 1960, by classes of ore or other source materials, in terms of recoverable metals**

| Source | Number of mines [1] | Material sold or treated (short tons) | Gold (troy ounces) | Silver (troy ounces) | Copper (pounds) | Lead (pounds) | Zinc (pounds) |
|---|---|---|---|---|---|---|---|
| Lode ore: | | | | | | | |

[1] Detail will not necessarily add to totals because some mines produce more than one class of material.
[2] From properties not classed as mines.

**Iron Ore.**—Brown iron ore (limonite) production remained virtually the same as in 1959. Brown ore for use in paint was mined at three properties: The Geneva mine in Clear Creek County by Stony Point Development, Inc., the South Mineral Placer in San Juan County by A. A. McCluskey, and the Iron Springs Placer in San Miguel County by C. K. Williams & Co. A small quantity was produced for use as a soil conditioner from Iron Lode No. 3 in San Miguel County by Theresa B. Robinson.

Company mines in Utah and Wyoming supplied iron ore for the Pueblo plant of CF&I. The corporation annual report for 1960 reported an operating loss, the first since 1946, owing to a sharp reduction in sales to the petroleum, railroad, and automobile industries, and other basic users of heavy-tonnage products, together with particularly strong foreign competition. New oxygen-steel converters capable of producing 600,000 tons of ingots annually were being installed at the Pueblo plant to improve productive efficiency.

Pitkin Iron Corp. produced iron ore from its property above Ashcroft in Pitkin County for testing at Columbia Iron Mining Co. (U.S. Steel) at Geneva, Utah.

Titaniferous iron deposits in Gunnison County were described.[6]

**Lead.**—The quantity and value of lead produced increased 40 and 43 percent, respectively. The weighted annual average price for lead was 11.7 cents compared with 11.5 cents in 1959. Lead was mined in 16 counties. Ninety-four percent of the Colorado lead output was supplied by the Treasury Tunnel-Black Bear-Smuggler Union group of mines of the Idarado Mining Co. in *Upper San Miguel* district, San Miguel County; the Eagle mine of The New Jersey Zinc Co. in *Red Cliff* district, Eagle County; the Emperius mine of Emperius Mining Co. in *Creede* district, Mineral County; and the Rico

Argentine mine of Rico Argentine Mining Co. in *Pioneer* district, Dolores County.

During October, Camp Bird Colorado, Inc., began treating ores at its new 500-ton-per-day flotation mill at the Camp Bird mine in Ouray County. Flotation products included silver-bearing copper-lead-zinc sulfide and zinc sulfide concentrates. In addition, free gold was recovered by jigging.

Asarco announced that it would suspend operations at its Leadville smelter early in 1961 because of a declining ore supply. The smelter had been in operation for 81 years. Ore-buying was to be continued and ores and concentrates were to be treated at company smelters at El Paso and Amarillo, Tex. The Asarco cadmium-producing Globe plant in Denver would not be affected.

**Molybdenum.**—Molybdenum was produced at the Climax mine in Lake County by Climax Molybdenum Co., Climax Division, American Metal Climax, Inc. The company annual report cited an output of 11,684,000 tons of ore, 28 percent above that of 1959, from which a record quantity of molybdenum was recovered. Byproducts recovered in treating molybdenum ore were tungsten, tin, and pyrite.

During the year, progress was made on the beginning phases of opening a new (third) level, 300 feet below the Storke level, for future ore development. The arrangement by which John W. Galbreath & Co. purchased company houses at Climax and Leadville for resale to company employees progressed during the year. It was estimated that it would take two more summers to move all the houses from Climax to Leadville.

**Silver.**—Silver production increased 24 percent, from 1.3 million troy ounces in 1959 to 1.7 million troy ounces. Leading producers, supplying 80 percent of the State's production, were Idarado Mining Co. from the Treasury Tunnel-Black Bear-Smuggler Union group of mines in Upper San Miguel district, San Miguel County; The New Jersey Zinc Co. from the Eagle mine in Red Cliff district, Eagle County; Emperius Mining Co. from the Emperius mine in Creede district, Mineral County; and Standard Metals Corp. from the Shenandoah mine in Ute-Ward district, San Juan County.

The Climax Molybdenum Co. marketed [illegible] long tons of tin concentrate produced from molybdenum flotation tailing at its Climax mine compared with 51 long tons in 1959. However, the concentrate marketed in 1960 was the accumulation of production from 1956 through 1960.

Tungsten [illegible] was recovered by treating molybdenum flotation tailing from the Climax mill of Climax Molybdenum Co. [illegible] was marketed than in [illegible] decrease of 3 percent.

[illegible] was described.[7] [illegible] 11 percent over that [illegible] 26 percent [illegible] the value of production [illegible] was produced from 522 [illegible] having a value of

[illegible] Bureau of Mines

output of over $1 million, in order of importance, were as follows: Montrose, San Miguel, Mesa, Moffat, Saguache, and Jefferson.

The upgrading plant at Slick Rock and processing mills in Gunnison, Grand Junction, Durango, Rifle, Uravan, Maybell, and Canon City continued to operate during the year. The Atomic Energy Commission (AEC) contract with Climax Uranium Co., Climax Division, American Metal Climax, Inc., for the purchase of concentrate was extended to December 31, 1966, or to a date determined by an earlier delivery of the maximum quantity provided by the contract. Early in 1960 the Cotter Corp. began expanding its Canon City mill to the 200-ton daily capacity authorized by AEC. AEC authorization also provided for processing of appropriate quantities of crude ore from qualified independent producers. A substantial part of the expanded plant was used in processing uranium ore mined by Denver-Golden Corp. from its Schwartzwalder mine in Jefferson County.

Two papers [8] on uranium in Colorado were published.

**TABLE 10.— Mine production of uranium ore, by counties [1]**

| County | 1959 | | | | 1960 | | | |
|---|---|---|---|---|---|---|---|---|
| | Number of operations | Ore (short tons) | $U_3O_8$ contained (pounds) | F.o.b. mine value [2] | Number of operations | Ore (short tons) | $U_3O_8$ contained (pounds) | F.o.b. mine value [2] |
| Boulder | 3 | (3) | (3) | (3) | 2 | 4,131 | 52,181 | $238,088 |

**Vanadium.**—Recovery of vanadium from uranium ores containing enough vanadium to cover the cost of treatment was made at four Colorado uranium-processing mills operated by the following: Climax Uranium Co., Grand Junction; Union Carbide Corp., Union Carbide Nuclear Co. Division, Rifle and Uravan; and Vanadium Corp. of America (VCA), Durango. Crude ore from mines in Colorado, New

[8] Redmon, D. E., Exploratory Drilling Practices and Costs at Western Uranium Deposits: Bureau of Mines Inf. Circ. 7944, 1960, 68 pp.

Mexico, Arizona, Utah, and Wyoming was processed at these mills; the vanadium oxide recovered was credited to the State of origin. The quantity recovered from ores of Colorado was 37 percent greater than in 1959.

As high bidder for vanadium oxide offered for sale at Grand Junction by AEC, VCA purchased 1.6 million pounds for $1 per pound. In November AEC offered an additional 1.5 million pounds for sale; sealed bids were to be opened on January 25, 1961.

**Zinc.**—Zinc production declined 12 percent in quantity but only 1 percent in value. The weighted annual average price increased from 11.5 cents per pound in 1959 to 12.9 cents per pound. Of the zinc mined in Colorado, 99 percent was produced by the following companies: The New Jersey Zinc Co. from its Eagle mine in *Red Cliff* district, Eagle County; Idarado Mining Co. from the Treasury Tunnel-Black Bear-Smuggler Union group of mines in *Upper San Miguel* district, San Miguel County; Emperius Mining Co. from the Emperius mine in *Creede* district, Mineral County; and Rico Argentine Mining Co. from the Rico Argentine mine in *Pioneer* district, Dolores County.

## NONMETALS

**Cement.**—Because of less construction in the areas served by Ideal Cement Co., the production of types I, II, III, and V portland and masonry cements was 15 percent under that of 1959. Four kilns, two at the Portland plant at Portland in Fremont County and two at the Boettcher plant at La Porte in Larimer County, were operated during the year. Seventy-two percent of the finished cement sold was transported by truck and the remainder by rail to purchasers in Kansas, Montana, Nebraska, New Mexico, Utah, and Wyoming, as well as to consumers in Colorado.

**Clays.**—A 7-percent increase in output of fire clay plus a 35-percent increase in output of miscellaneous clays resulted in an overall 18-percent advance in production of all types of clays mined. Of the total, fire clay amounted to 291,000 tons (39 percent); the remainder was comprised of miscellaneous clays and 1,500 tons of bentonite. Jefferson County continued to be the leading producer of fire clay and miscellaneous clays, followed by Boulder, Douglas, and Pueblo. The 500,000-cubic-yard-per-year shale-processing lightweight aggregate plant of Great Western Aggregates, Inc., subsidiary of Ideal Cement Co., was 75 percent complete at yearend.

Denver Fire Clay Co., producer of refractory products, completed a $500,000 modernization program at its Denver plant. A major part of the program was the construction of a shuttle-type kiln, the first [illegible] in the country [illegible] firing system.

**Feldspar.**—Feldspar production continued to decline. M. & S., Inc., the only remaining producer in the State, continued to operate its mine in the Spruce area and ship to the Salida mill of Western Feldspar Mills, Inc.

**Fluorspar.**—The shipment sheet of Division, Allied Chemical Corp., showed that the Wagon Wheel and Vermont mill in Boulder County, was the only fluorspar producer.

| Pueblo | 64,467 | 239,878 | 64,738 | 266,465 |
| Undistributed | 12,935 | 30,449 | 85,030 | 178,766 |
| Total | 417,481 | 1,160,009 | 489,762 | 1,424,239 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."

**Gem Stones.**—Gem stones and specimens valued at $45,000 (5 percent above that of 1959) were produced and collected from widely distributed areas in over one-third of the counties. Turquoise worth $16,360, mined from the Villa Grove Turquoise Lode in Saguache County, again made Villa Grove the richest gem-stone-producing locality. Specimens collected from unidentified areas were valued at $15,000, only slightly less than in 1959.

**Gypsum.**—Four mines in Fremont and Larimer Counties produced 82,000 tons of crude gypsum, 23 percent below that of 1959. The U.S. Soil Conditioning Co. mined agricultural gypsum from its Fremont County pit near Salida. The Pabco Building Materials Division of Fibreboard Paper Products Corp. produced gypsum from its Fremont County deposit for use in manufacturing cement at the Portland plant of Ideal Cement Co. and for its own plaster plant at Florence. In Larimer County, gypsum for the Boettcher plant of Ideal Cement Co. was supplied by E. W. Munroe from his mine near Fort Collins. The United States Gypsum Co. mined gypsum from a deposit near its Loveland plant.

**Lime.**—Production of quicklime and hydrated lime for building, agricultural, chemical, and industrial uses was more than double the 1959 output. Two plants—one near Colorado Springs and the other at Glenwood Springs—supplied a small part of the lime used in Colorado.

**Mica.**—Scrap-mica production increased from 68 to 340 tons and came from two properties in Larimer County: the Langston mine of Jolex Mica Co. and the H. L. Mattox property. All the scrap was ground by Jolex Mica Co. at its plant at Fort Collins.

**Perlite.**—The only source of crude perlite in Colorado continued to be the Rosita mine of Persolite Products, Inc.; output decreased 18 percent below that of 1959. Grinding and expanding was done at the Persolite perlite plant at Florence. New Mexico mines continued to supply perlite to Western Mineral Products Co. of Denver.

**Pumice.**—Production of 32,000 tons of pumice from Costilla, Eagle, and Routt Counties declined 20 percent but the average value per ton increased 6 percent. Volcanic scoria, used principally as railroad

Digitized by Google

ballast, was also used as concrete admixture, concrete aggregate, insulation, roofing aggregate, and in highway cindering.

**Pyrites.**—A 9-percent decrease in overall production of pyrite was due largely to a smaller tonnage of pyrite recovered as a byproduct of molybdenum-ore processing by Climax Molybdenum Co. The pyrite was shipped to the acid plant of General Chemical at Denver. On January 30 a fire destroyed the pyrite crushing plant, pyrite storage, and accessory equipment of the sulfuric acid plant of Rico Argentine Mining Co. at Rico. Consequently, acid production at the plant virtually stopped for 2 months. However, despite this interruption, Rico produced more acid in 1960 than in 1959. The Rico Argentine Mining Co. annual report stated that 36,426 tons of pyrite, almost entirely mined from the Mountain Springs area, was used to produce 28,859 tons of 100-percent-basis sulfuric acid during the 1960 fiscal year.

**Salt.**—Union Carbide Nuclear Co. continued to pump brine from its Montrose County well for use in treating uranium ores.

**Sand and Gravel.**—A 9-percent decline in production of sand and gravel resulted chiefly from reduced consumption for paving and building. Sand and gravel was produced in 59 of Colorado's 63 counties. Adams County, again the leading producer, was followed by Jefferson, El Paso, Arapahoe, Weld, and Pueblo; each had an output exceeding 1 million tons. The leading commercial producers were Brannan Sand & Gravel Co.; Cooley Gravel Co.; Western Paving Construction Co.; Rio Grande Gravel Co.; Nielsons, Inc.; Herren & Strong Gravel Co., Inc.; and Whitewater Sand & Gravel Co. A

report[9] showed that from July 1, 1956, to December 31, 1960, Colorado completed to full or acceptable interstate highway standards 128 miles of road plus 100.7 miles of highway adequate for present traffic for a total of 228.7 miles open to traffic. With this mileage, the State ranked 17th in the United States.

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other."

**Stone.**—Lower consumption of crushed limestone in the cement industry caused a 14-percent decrease in production of stone. In addition to use in the cement industry, crushed limestone was used for flux in

[9] Bureau of Public Roads, Quarterly Report on the Federal-Aid Highway Program, Dec. 31, 1960, press release BPR 61–6, Feb. 22, 1961.

Digitized by Google

manufacturing steel, making concrete, refining sugar, making quicklime and hydrated lime, and road construction. A greater need for crushed sandstone, principally in concrete and road construction, more than offset the lesser need for dimensional sandstone, resulting in a 41 percent increase in the quantity of sandstone quarried.

Dimensional granite and marble were used chiefly for monumental stone. The principal use for crushed granite was in road construction; a small quantity was used as ornamental aggregate.

Vermiculite.--Crude vermiculite produced in Montana was exfoliated by the Western Mineral Products Co. at its Denver plant for use as insulation and lightweight aggregate.

[1] Includes asphalt filler, coal dust, filter beds, cement, lime, marble whiting, block filler, plaster and cleaning sands, terrazzo, and roofing chips.
[2] Includes asphalt filler, cement, lime, marble whiting, plaster sand, terrazzo, roofing chips, ornamental aggregate, stucco, agriculture, and poultry grits.

## REVIEW BY COUNTIES

**Adams.**—Production of sand and gravel at 15 operations was 3.3 million tons, furnishing 56 percent of the total value of all minerals produced. Brannan Sand & Gravel Co., Western Paving Construction Co., Boise Cascade Sand & Gravel Co., and Cooley Gravel Co. were the principal producers. Stone output consisted of crushed miscellaneous stone quarried by contractors for the Colorado Department of Highways; the stone was used as riprap and road metal.

Petroleum production, supplying 43 percent of the value of the county's mineral output, all from 94 wells in 17 fields, was 39 percent above that of 1959. Three new fields were discovered. In June, B. F. Allison discovered the Beryl field when he completed the No. 1 Dawson-Dinnsen well. Initial production was 1.2 million cubic feet of gas from the J sandstone at a depth of 5,715 to 5,721 feet. In July, Delhi-Taylor Oil Corp. completed the No. 1 Cowell, which flowed 300 barrels of oil a day from the J sandstone at a depth of 6,332 to 6,333 feet. The field was named the Deer Trail. In August, Delhi-Taylor Oil Corp. completed the No. 1 State-Plains well, 3.5 miles to the northwest of the Deer Trail discovery. The well flowed 1.9 million cubic feet of gas a day from the J sandstone. Offset wells to the west and southeast and a stepout well to the southeast were failures. The throughput of natural gas at the plant operated by N. C. Ginther at the Leader field was 205.2 million cubic feet of gas with the recovery of 9,3900 barrels of natural gas liquids.

**TABLE 17.—Value of mineral production in Colorado, by counties[1]—Continued**

| County | 1959 | 1960[2] | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Saguache | $1,776,590 | $1,650,855 | Uranium ore, gem stones, sand and gravel, zinc, lead, silver, copper, gold. |
| San Juan | [6] 92,816 | 300,772 | Copper, lead, silver, gold, zinc, sand and gravel, iron ore, gem stones. |
| San Miguel[4] | 10,042,933 | 11,745,179 | Uranium ore, zinc, lead, copper, gold, silver, iron ore, sand and gravel, stone, gem stones. |
| Sedgwick[4] | 60,900 | 31,860 | Sand and gravel, gem stones. |
| Summit | 72,015 | 591,718 | Sand and gravel, gold, lead, silver, copper. |
| Teller | 1,165,950 | 1,219,496 | Gold, stone, peat, silver, gem stones, sand and gravel. |
| Washington[7] | [8] 19,727,350 | 23,215,048 | Petroleum, sand and gravel, stone. |
| Weld[4] | 9,507,101 | [8] 8,380,730 | Petroleum, coal, sand and gravel, stone, gem stones. |
| Yuma | 574,967 | 138,900 | Sand and gravel, petroleum, gem stones. |
| Undistributed[11] | [9] 22,219,751 | 43,269,672 | |
| Total[12] | [9] 314,677,000 | 342,223,000 | |

[1] Denver County is not listed because no production was reported.
[2] Petroleum value is preliminary.
[3] Excludes natural gas liquids.
[4] Excludes natural gas.
[5] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[6] Excludes vanadium.
[7] Excludes natural gas and natural-gas liquids.
[8] Revised figure.
[9] Excludes natural gas and vanadium.
[10] Excludes natural gas, natural gas liquids, and vanadium.
[11] Includes vanadium, natural gas, natural gas liquids, some sand and gravel and gem stones and values indicated by footnote 5.
[12] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.

The entire output of gold and silver was recovered as a byproduct of the washing and screening of sand and gravel at six operations. Kerkling & Slensker recovered gold and silver from gravel sluiced from the Boise Cascade Sand & Gravel pit, F. S. Rizzuto Gravel pit, and Brannan Pits Nos. 8 and 10; Robert B. Ray from Clear Creek Rock Products Co. gravel pit; and Cooley Gravel Co. from its North Plant pit.

A public purchase depot and plant maintained in Arvada by Beryl Ores Co. for beryl and other beryllium-bearing ores was equipped to inspect and analyze beryllium-bearing ores and to crush and grind these ores for the varied requirements of the ceramic industry. The Beryl Ores Co. also was equipped to produce beryllium basic acetate, an important compound of high-purity beryllium, to make other beryllium compounds on order, and to grind mica for the roofing and paint industries.

**Alamosa.**—Oriental Refining Co. operated its 1,100-barrel-a-day refinery at Alamosa. Throughput was 274,000 barrels of crude oil, a slight decline from that of 1959.

**Arapahoe.**—Sand and gravel continued to dominate the mineral industry of the county. Nine commercial and Government-and-contractor operations produced 13 million tons of aggregate valued at $1.4 million. Cooley Gravel Co., with plants at Englewood and Littleton, was the major mine operator. Other important producers were Colorado Materials Co. and Herbertson Sand & Gravel Co.

**Archuleta.**—Petroleum production from 35 wells in 2 fields was 10 percent below that of 1959.

**Baca.**—Natural gas was produced at the Greenwood and Prairie Dog fields. One new field (Midway) was discovered when Horizon

Digitized by Google

Oil & Gas Co. completed the No. 1–22 Cogburn well in October. The well flowed 8.4 million cubic feet of gas a day from the Topeka at a depth of 3,031 to 3,056 feet and from the Morrow at a depth of 4,674 feet.

**Bent.**—Petroleum production from that part of the McClave field lying within the county increased sixteenfold over that of 1959. Carbon dioxide from wells in Las Animas County was processed at Ninaview.

**Boulder.**—Although nonmetals continued to supply most of the total value of mineral production, their contribution decreased to 85 percent as a result of reduction in the output of sand and gravel and stone plus an increase in mine shipments of uranium ore. General Chemical operated its Burlington fluorspar mine and Valmont mill at about the same rate as that reported in 1959. Colorado Brick Co. and Eldorado Clay Co. mined fire clay and miscellaneous clay at their Valmont, Longmont, and Nos. 1 and 2 claypits at an increased rate. Boulder Gravel Products, Inc., Golden Transfer Co., Pendleton Construction Co., and C & M Sand & Gravel Co. produced nearly all the 526,900 tons of sand and gravel reported.

Boulder Gravel Products, Inc., recovered small quantities of gold and silver as byproducts of the washing and screening of sand and gravel at its Geo. Sawhill Ranch pit. Silver ore containing, in addition to silver, small quantities of gold, copper, and lead was produced and marketed from the Blue Bird mine. No tungsten ore or concentrate was produced or shipped from Boulder County tungsten deposits during the year; however, rejects from the Climax mill (Lake County) were re-treated by Earl Sweeney in the Marion mill, and the resultant tungsten concentrate was marketed.

Petroleum production from the Boulder field was approximately the same as in 1959. Uranium ore produced by La Salle Mining Co. at the Fair Day mine was shipped to Salt Lake City, Utah, for processing. Peat humus was mined for use as a soil conditioner.

**Chaffee.**—The chemical and construction materials—feldspar, stone, and sand and gravel—provided most of the value of mineral output. M. & S., Inc., operated its Homestake feldspar mine, shipping the crude ore to the Salida mill of Western Feldspar Milling Co. The Monarch quarry of CF&I contributed most of the stone output. Colorado Granite Co. quarried a small quantity of monumental granite, and Bailey Manufacturing Co. produced crushed granite for use as poultry grit. Construction crews of the State and county highway departments and the Hart Rok Redi Mixt Concrete Co. produced the 100,800 tons of sand and gravel recorded.

The Double R Mines worked the Mine Site Lode during the year and shipped 11,519 pounds of beryl concentrate to the Government purchase depot at Custer, S. Dak.

**Clear Creek.**—Most of the gold, silver, copper, lead, and zinc output in the county was recovered from lead ore produced from the Jackpot Oil Co. Bald Eagle mine by P. G. Leavitt and Milton George, lessees. These metals also were recovered from cleanup material from the Eagle mill and from ore produced from six other active mines—Ashland, Burleigh Tunnel, Dixie, Drummond, Franklin Claim No. 73, and Kitty Clyde.

Digitized by Google

Stony Point Development, Inc., produced and shipped brown iron ore (limonite) from the Geneva mine to Columbia Carbon, Monmouth, N.J., for use in manufacturing paint.

Uranium ore produced at the Little Warrior mine by Seacol, Inc., was shipped to Canon City for processing.

**Costilla.**—Increased shipments of pumice (scoria) by Colorado Aggregate Co., Inc., reversed the downward trend of the past few years. The Mesita Hill deposit near Mesita was the source of the scoria. Concrete admixture, insulation, and roofing aggregate were the end uses for 1960 shipments.

**Custer.**—The Rosita perlite mine, leased by Persolite Products, Inc., was operated at relatively the same rate as in 1959. Crude material was trucked to Florence for expanding; building plaster, insulation, concrete, and aggregate were the principal uses for the finished product. Ralph J. Pierce reported production of 2,000 tons of fire clay from the Lawson Place deposit.

**Delta.**—Coal production from seven underground mines was slightly above that of 1959. The major producer was the Juanita Coal & Coke Co. at the King mine.

**Denver.**—Five petroleum refineries in the Denver area operated throughout the year. Throughput was 11.7 million barrels, a 1-percent increase over that of 1959. Continental Oil Co. completed the addition of 2,000 barrels a day of vacuum capacity at its 18,000-barrel-a-day plant at Denver.

**Dolores.**—The Rico Argentine Mining Co. reported to stockholders that 14,653 tons of lead-zinc ore was mined and milled during the fiscal year ending June 30, 1960. Of this quantity, 8,465 tons was produced from the Mountain Springs area and the remainder from the Argentine area of the mine. The mill was operated at about 40 percent capacity. From the ore milled, 2,270 tons of lead and zinc concentrates containing 53 ounces of gold, 50,200 ounces of silver, 905 tons of lead, and 641 tons of zinc was shipped to smelters. Development work in the mine included 1,823 feet of drifts and crosscuts, 984 feet of raises, and 113 feet of long-hole drilling.

Rico Argentine also mined 36,426 tons of pyrite, virtually all from the Mountain Springs area of the mine. From this pyrite, 28,859 tons of 100-percent-basis commercial sulfuric acid was produced in the company plant at Rico. Ore storage bins, the crushing plant, and miscellaneous buildings, destroyed by fire January 30, were rebuilt during the year.

**Douglas.**—Increased value of the output of sand and gravel, stone, and clay boosted the total value of mineral production to $657,000, a gain of 50 percent. Hall Sand & Gravel Co. and Garfield Gravel, Inc., produced most of the aggregate quarried during the year. Robinson Brick & Tile Co. operated its Diamond, Ute, and Hogback mines. Denver Brick & Pipe Co. produced fire clay from the Ringenberg deposit, and Helmer Bros. and Stroud A. Whisenhunt mined fire clay from the Helmer and Stevens mines. Colonna Co. of Colorado, Inc., quarried and crushed granite for use as exposed aggregate in buildings, and Helmer Bros. reported the production of a small quantity of crushed limestone used as flux and for agricultural purposes.

Digitized by Google

**Eagle.**—Empire Zinc's Eagle mine led in output of zinc; ranked second in production of copper, lead, and silver; and ranked third in gold output in the State. It was closed by a labor strike for 4 months during the year. Production of direct-shipping copper-silver ore was below that of 1959 because this type of ore did not occur in the new area of the mine opened. Exploration and development on lower levels continued throughout the year.

Mine production of scoria was only half that of 1959 and resulted from cutbacks at the Dotsero and Carbondale deposits of Lava Products, Inc., and Roaring Fork Pumice Co. The Lava Products plant was shut down part of the year to complete an expansion program.

**El Paso.**—Although the value of output dropped 19 percent from 1959, mineral-production activity again was dominated by the sand and gravel and stone industries. The county ranked third in the State in the quantity of sand and gravel produced. Government-and-contractor production amounted to 54 percent of the 1.4 million tons output; seven commercial operators quarried 635,000 tons of building and paving sand and gravel. Castle Concrete Co., Colorado Lime Co., and Colorado Materials Co. mined crushed limestone; and Colonna Co. of Colorado, Inc., produced crushed granite. Increased shipments of clay were reported. The producers were National Clay Products Co. (National mine), Robinson Brick & Tile Co. (Apache), and Standard Fire Brick Co. (Husted). Colorado Lime Co. nearly doubled its output of quicklime and hydrated lime from its Pikeview operation.

**Fremont.**—The effect of cement-manufacturing activities on the mineral industry was evident again in 1960. The total value of mineral production decreased to $11.1 million, a decline of 19 percent, chiefly because of reduced shipments of cement from the Portland plant of Ideal Cement Co. Attendant to cutbacks in cement production and shipments was reduced quarry output of limestone used in manufacturing cement. Crushed limestone output was also reported by CF&I, Colorado Limestone Co., and Frank H. Nordberg Co.; zinc and sugar refining were the principal uses. Colonna Co. of Colorado, Inc., and Ocean Bank produced crushed and dimension marble and granite. Fire clay production was reported by Ralph V. Payne from the Flint, Salt Canyon, and Stage Coach Road mines; by George O. Stroup from the S. V. B. and Pearson Canyon mines; and by Irwin Clay Co. from the Irwin mine. Clem Lansberry & Sons produced [illegible] tons of bentonite from the Florence-Lansberry group of claims. Fremont Paper Products Corp. manufactured [illegible] wood and plaster-products [illegible] made gypsum from a mine near Canon City.

[illegible] Co. recovered [illegible] from the Mary Lee and Mica [illegible] and [illegible] & Co. mined [illegible] the year; all output was sold to [illegible] Chemical Co. plant.

[illegible] increased [illegible] Operations were [illegible] Corley Co. at [illegible] Corley Stone mines, Vento [illegible] Co. at the Beer [illegible] was destroyed by fire in January. [illegible] the production of

Digitized by Google

coal. Petroleum production from 28 wells in the Florence-Canon City field was 31 percent below that of 1959. Uranium ore was produced at 16 operations and increased 74 percent in quantity and 47 percent in value over that of 1959. Major producers were Cotter Corp. at the Picnic Tree and Red Cliff mines; Gunnison Mining Co. at the Last Chance and from land leased from the State Land Board; and Juniper Oil and Mining Co. at the Snooper, Thorne, and Dickson Lease mines. The output was processed at mills in Canon City and Gunnison. The Cotter Corp. operated its uranium-processing mill at Canon City throughout the year, using crude ore mainly from the Front Range and adjoining counties.

**Garfield.**—Frank H. Norberg Co., operating the Glenwood Springs limestone quarry, produced all the stone in Garfield County in 1960. This limestone was used in sugar refining and road construction, as a flux, and for manufacturing lime. Basic Chemical Corp. tripled its output of quicklime and hydrated lime at its Glenwood Springs plant.

Natural gas was produced from 17 wells in 7 fields. Two discoveries were credited to the county. In December, Argo Oil Co. completed a well in the South Baxter Pass area, northeast of the South Baxter Pass field, discovered in 1959. Initial flow was 1.7 million cubic feet of gas a day from the Morrison at a depth of 6,959 to 7,182 feet. Also in December, Mountain States Drilling Co. completed the No. 1 Boulton, which flowed 850,000 cubic feet of gas a day from the Divide Creek at a depth of 7,526 to 7,886 feet. The well was 4 miles north of the northernmost producer at the Divide Creek field and 4 miles east of the Baldy Creek field, with no intervening wells. Coal production from five mines was 12 percent below that of 1959. Major producers were Bendetti Bros. at the New South Canon mine and William Haas, Jr., at the Black Raven mine. Union Carbide Nuclear Co. operated its 1,000-ton-a-day uranium mill at Rifle. Crude ore came from mines in Colorado, Utah, and Wyoming and upgraded material from a beneficiating plant at Slick Rock in San Miguel County. The purchase contract for uranium oxide with AEC, scheduled to expire on March 31, 1962, was being negotiated for the 1962–66 period.

**Gilpin.**—Peat humus was mined from deposits near Black Hawk for use as a soil conditioner and as a fertilizer admixture.

Gold, silver, and lead were recovered from ore produced from the Lone Star mine and treated in the Marion mill. Two gold-silver placer mines, Ralston Creek Placer and Smith Tyler, were active part of the year.

**Gunnison.**—Coal production from eight mines was 3 percent above that of 1959. The major producer was Minerals Development Corp. of Colorado, operating the Oliver No. 3 and Somerset mines. A part of the production from the Oliver No. 3 was transported by conveyor belt to the Western Colorado Power Co. Oliver powerplant at Somerset. Production from the Somerset mine was shipped to Utah for manufacturing coke. Bear Coal Co. operated the Bear mine, and Champion Coal Mining Co. operated the Hawk's Nest mine. Uranium ore produced by Cotter Corp. at the Big Red mine was processed at a company-owned plant at Canon City. Gunnison Mining Co. operated

Digitized by Google

its 200-ton-a-day acid-leach recovery mill at Gunnison. The uranium oxide purchase contract with AEC, which was to expire on March 31, 1962, was extended to December 31, 1962.

The leading producer of silver, copper, lead, and zinc in the county was the Standard Metals Corp. Micawber mine. The ore mined was treated in the company mill at Crested Butte, and the copper-lead, lead, and zinc concentrates produced were shipped to various smelters for recovery of the metals. Other active mines producing one or all of these metals included the Baxter Lode, Endner, Gold Links, and Little Darling.

George B. Tucker recovered a small quantity of beryl from the Monazite Lode and shipped the hand-cobbed concentrate to Custer, S. Dak.

**Hinsdale.**—The entire mineral output consisted of gold, silver, copper, and lead recovered from ore and mine-dump material from the Pelican mine and ore from the Never Sweat mine.

**Huerfano.**—Coal production from seven mines was slightly above that of 1959. Major producers were Delcarbon Coal Co. at the Calumet No. 2, Morning Glory Coal Co. at the Morning Glory, Red Ash Coal Co. at the Maitland No. 2, and Vista Coal Co. at the Gordon. Fire destroyed the tipple at the Maitland No. 2.

The Chamblin mine of Standard Fire Brick Co. continued as the only source of clay. Sand and gravel output was reduced to 3,200 tons of paving gravel that was produced by a contractor for the Colorado Department of Highways.

**Jackson.**—Petroleum production from 45 wells in 4 fields was 9 percent below that of 1959. Major production came from the McCallum and South McCallum fields. Carbon dioxide (77.9 billion cubic feet) produced at the McCallum and South McCallum fields was vented. Coal production at the Rosebud strip mine was 42 percent above that of 1959. The operation was abandoned in midyear. Pioneer Exploration Co. mined uranium ore at the Hume mine and shipped it to Rifle and Maybell for processing.

A small quantity of acid-grade fluorspar was shipped from stock by Ozark-Mahoning Coal Co. at Cowdrey.

**Jefferson.**—Jefferson County ranked second in the production of sand and gravel, the county's principal mineral product. Output was valued at $1.8 million. The leading producers were Rio Grande Gravel Co., Table Mountain, Inc., Asphalt Paving Co., Western Paving Construction Co., L. H. Kilgroe, and Brannan Sand & Gravel Co., each of which produced over 100,000 tons of aggregate.

The county was also the principal source of clays used for manufacturing building brick and other clay products. Denver Brick & Pipe Co. operated the Caldwell Nos. 4 and 71 and Strainland mines, Denver Fire Clay Co. operated the North and South Golden mines, Robinson Brick & Tile Co. operated the Lariat and Chieftain deposits, and Lakewood Brick & Tile Co. operated the Lindsay and Lakewood claypits. The following mine operators produced clay for sale to brick plants in the Denver metropolitan area: Garnett C. Bennetts (Leyden and Ramstetter pits), Duane J. Bruno (Mount Carbon mine), Wesley Conda (State and Church pits), Leland Doughty (Doughty claim), George W. Parfet Estate, Inc. (Rockwell-Apex-

Digitized by Google

Green Mountain deposits), John L. Harvey, and H. M. Rubey Clay Co.

Beryl recovered from the Beggar mine by Fred H. Olmstead was sold to Mincon at Loveland. The W. O. W. mine was worked for a short period by Ben Walz, and 333 pounds of beryl concentrate was sold to Beryl Ores Co. at Arvada.

Of the 10 operations producing uranium ore, major producers were Denver-Golden Corp. at the Schwartzwalder, Foothills Mining Co. at the Wright lease, and Yellow Queen Uranium Co. at the Ascension mine. The output was shipped to processing mills at Gunnison and Canon City; Riverton, Wyo.; and Salt Lake City, Utah.

Gold and silver were recovered as byproducts at three sand and gravel washing and screening plants: Brannan Sand & Gravel Co. Pit. No. 11, the Rio Grande Gravel Co. W. P. Kerkling placer pit by Kerkling & Slensker, and the Suburban Sand & Gravel Co. pit by Robert R. Ray.

**Kiowa.**—Petroleum production from the Brandon field increased fourfold over that of 1959.

**Lake.**—The entire molybdenum production of Colorado came from the Climax mine of Climax Molybdenum Co. Tungsten, tin, and pyrite recovered as byproducts of the molybdenum ore were marketed. Some of the pyrite produced was sold to a Denver plant for use in manufacturing sulfuric acid.

**La Plata.**—Petroleum production, from eight wells in the Red Mesa field, increased slightly over that of 1959. Natural gas was produced from 250 wells in the Ignacio-Blanco; producing formations were the Mesaverde (195 wells), Fruitland-Pictured Cliffs (36 wells), and Dakota (19 wells). The Barker Dome and Alkali Gulch fields, with four wells each, produced natural gas from the Paradox formation. El Paso Natural Gas Co. operated its Ignacio natural gas plant near Durango. The plant extracted natural gas liquids from products of natural gas fields in Colorado and New Mexico. Throughput of gas from Colorado wells was 67 billion cubic feet (including dry gas passed through plant compressors); 709,500 barrels of natural gas liquids was recovered. Coal production from nine mines was 9 percent above that of 1959. Major producers were Victory Coal Co. at the Victory No. 3 mine, King Coal Co. at the King, and Peacock Coal Co. at the Peacock. VCA operated its 750-ton-a-day uranium-vanadium processing plant at Durango. Crude ore came from mines in Colorado, Arizona, New Mexico, and Utah. Vanadium was recovered from those uranium ores containing significant quantities of vanadium oxide. The value of the recovered vanadium was credited to the State of origin. Negotiations continued with AEC toward extending the uranium-oxide purchase contract that was to expire March 31, 1962.

**Larimer.**—An increase in the output of sand and gravel and a small gain in the value of cement shipments contributed a 2-percent rise in the value of mineral production over that of 1959. Although the quantity of cement shipped from the Boettcher plant of Ideal Cement Co. declined slightly, a higher average price resulted in the small overall gain in value of shipments. Crushed limestone, used in manufacturing cement and in refining sugar, was the principal stone quar-

Digitized by Google

ried. The county was the major source of dimension sandstone in the State. Quarrying was done by Colorado Stone Co. (Berthoud, Loveland, and Rose stone quarries), Jacobson-Lyons Stone Co. (Carter Lake), Arthur Ohline (Ohline), Neal Sprague (Berthoud Pink Stone), Sterling Contracting Co. (Wild North), Weaver Stone Co. (Weaver), and Wild's Stone Quarries (Wild South). Types of building stone produced were rough construction, rubble, rough architectural, sawed, dressed, and flagging. Crude gypsum used in manufacturing cement was mined by E. W. Munroe from a pit near Fort Collins. United States Gypsum Co. mined gypsum from its property near Loveland for consumption at its Loveland wallboard plant. Scrap-mica output, 340 tons, came from the Langston mine operated by Jolex Mica Co. and from an unnamed property operated by H. L. Mattox. The crude mica was ground at the Jolex mill near Fort Collins.

A total of 48,276 pounds of beryl concentrate was recovered from Larimer County pegmatites. The ore, averaging 9.82 percent BeO, was sold to Mincon and Beryl Ores Co.

Petroleum production, from 38 wells in 5 fields, was slightly below that of 1959.

**Las Animas.**—Coal production from eight underground mines was slightly above that of 1959. Major production came from the Allen and Frederick mines operated by CF&I and was used for manufacturing coke at its Pueblo steel plant, from Albert Iuppa & Son Coal Co. at the Starkville No. 4 mine, from Rapson Coal Co. at the Rapson mine, and from Peacock Coal Co. at the Peacock mine. The Frederick mine at Valdez was closed late in December. Because of a limited reserve, the mine had not been mechanized as had the Allen mine, and increasing costs dictated abandonment as the developed reserve approached exhaustion. Carbon dioxide was produced at the Ninaview field and transported by pipeline to a processing plant in Bent County.

**Logan.**—Logan County ranked fourth in the production of petroleum. Production, from 436 wells in 66 fields, was 13 percent below that of 1959. A total of 39 exploratory wells, about one-fifth of the exploratory drilling in eastern Colorado, was drilled in Logan County. Of these, one at the Chess field was successful. B. F. Allison completed the No. 1 Bollish-Ramey well in July. The discovery well pumped 90 barrels of oil a day from the J sandstone at a depth of 4,800 to 4,818 feet. By yearend, Creslenn Oil Co. completed the workover of a previous failure that offset the discovery to the northeast. The offset well pumped 15 barrels of oil a day from the J sandstone. Development drilling resulted in 20 successful wells scattered over a number of fields. A substantial number of the successful wells were in the Little Hoot and West Padroni fields. N. C. Ginther operated natural gas plants at the Little Hoot, Padroni, Lewis Creek, and Yenter fields. Throughput of the four plants was 10.1 billion cubic feet of gas with the recovery of 486,000 barrels of natural gas liquids. Kansas-Nebraska Natural Gas Co. operated a stripper plant which recovered 49,000 barrels of natural gas liquids, at the Mount Hope-Walker compressor plant.

**Mesa.**—Uranium-ore production, from 80 operations, was 17 percent below that of 1959; however, the grade of ore produced increased from 0.28 percent $U_3O_8$ in 1959 to 0.30 percent. Major producers were Beaver Mesa Uranium Co. at the Rajah group, Mark 2, J. W. L. Fraction No. 1, and John Brown No. 14 mines; Climax Uranium Co. at the Arrowhead group, Karns Incline, the Incline group, Crow's Nest, Blue Ribbon No. 2, Mineral Channel No. 3, October Adit, and Ronnie No. 2; and Union Carbide Nuclear Co. at the Sun Spot and Sun Spot No. 2, Thunder Cloud No. 1, Trojan No. 18, Mary No. 3, Lucky Boy, and At 05–1–36 mines. The entire production was processed at mills in Grand Junction, Rifle, Uravan, and Durango. Climax Uranium Co. operated its 330-ton-a-day plant at Grand Junction. The AEC uranium-oxide purchase contract with Climax Uranium Co., approved in July 1950 and expiring on July 31, 1960, was replaced with a continuing contract, to expire on December 31, 1966. The new contract reserved part of the mill capacity for processing appropriate quantities of ore from qualified independent producers and provided for delivery of approximately 2.6 million pounds of uranium oxide, valued at $21 million, between August 1, 1960, and December 31, 1966. The mill recovered vanadium from Colorado Plateau ores containing significant quantities of vanadium oxide.

Coal production from seven underground mines was 21 percent above that of 1959. At the Cameo mine, operated by Kerr Coal Co., the major producer, the coal was delivered from the mine by conveyor belt to the 44-megawatt Cameo powerplant operated by PSC. American Gilsonite Co. operated its processing plant at Gilsonite, near Fruita, producing gasoline, diesel fuel, and metallurgical coke from gilsonite mined in Utah. Plans were announced to double the capacity of the plant to 1,600 barrels of gasoline, 1,300 barrels of diesel fuel, and 350 tons of coke a day. Natural gas production came from the Asbury Creek, Bar X, Buzzard Creek, Highline Canal, and Mack Creek fields. Four development wells were successful.

Junction Brick & Tile Co. continued to quarry miscellaneous clay from a pit near Grand Junction. All output was used at the company plant in manufacturing building brick and other heavy clay products. For the first time in the history of the county, beryl concentrate was shipped to the Government purchase depot at Custer, S. Dak. Dale W. Poe recovered beryl from the Blue Gem No. 1 claim and Frank E. Long, from the Crystal and Tantalum Lode and the Zaro No. 1 Lode.

**Mineral.**—Most of the gold, silver, and lead, and all of the copper and zinc output from the county came from ore produced from the Emperius mine operated by Emperius Mining Co. This mine was the third largest producer of silver, lead, and zinc in the State. Gold, silver, and lead were recovered from ore produced from the Outlet mine by Outlet Mining Co. A small quantity of silver ore was shipped from the Holy Moses dump by Sublet Mining Co.

**Moffat.**—Coal production from the Red Wing mine, operated by Colowyo Coal Co., was 4 percent above that of 1959. Petroleum was produced at 100 wells in 10 fields, principally at Powder Wash, Danforth Hills, and Iles. Natural gas was produced from the Ace, Hiawatha, West Hiawatha, Powder Wash, Sugar Loaf, and Thorn-

**TABLE 17.—Value of mineral production in Colorado, by counties [1]**

| County | 1959 | 1960 [2] | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Adams | $5,767,668 | [3] $6,312,996 | Sand and gravel, petroleum, gold, stone, silver. |
| Alamosa | 28,389 | 6,500 | Sand and gravel. |
| Arapahoe | 1,939,016 | 1,417,700 | Do. |
| Archuleta | 638,927 | 305,000 | Petroleum, sand and gravel, stone. |
| Baca [4] | 11,946 | 61,338 | Sand and gravel, stone. |
| Bent [4] | 257,931 | 114,033 | Sand and gravel, stone, petroleum. |
| Boulder | 1,877,445 | 1,805,373 | Fluorspar, sand and gravel, uranium ore, clays, stone, peat, silver, petroleum, gem stones, gold, copper, lead. |
| Chaffee | 604,925 | 606,838 | Stone, feldspar, sand and gravel, beryllium concentrate, gem stones. |
| Cheyenne | 119,500 | 141,800 | Sand and gravel. |
| Clear Creek | 186,672 | 240,291 | Sand and gravel, lead, gold, iron ore, silver, copper, zinc, uranium ore. |
| Conejos | 250,188 | 2,650 | Sand and gravel, gem stones. |
| Costilla | (5) | (5) | Pumice. |
| Crowley | 600 | 91,800 | Sand and gravel. |
| Custer | (5) | (5) | Perlite, sand and gravel, clays. |
| Delta | 531,119 | 641,801 | Coal, sand and gravel, stone. |
| Dolores | 508,877 | (5) | Pyrites, lead, zinc, silver, sand and gravel, copper, gold. |
| Douglas | 439,006 | 657,405 | Sand and gravel, clays, stone, gem stones. |
| Eagle | 7,088,270 | 6,306,750 | Zinc, lead, silver, copper, gold, sand and gravel, pumice, gem stones. |
| Elbert | 8,000 | 337,058 | Sand and gravel, stone. |
| El Paso | 2,021,915 | 1,645,542 | Sand and gravel, stone, lime, clays, coal, gold, silver. |
| Fremont | 13,654,429 | 11,115,959 | Cement, stone, coal, uranium ore, gypsum, clays, petroleum, sand and gravel, beryllium concentrate, gem stones. |
| Garfield [4] | 191,838 | 288,050 | Coal, lime, sand and gravel, stone, gem stones. |
| Gilpin | 12,322 | 15,713 | Peat, gold, sand and gravel, silver, lead, copper, uranium ore. |
| Grand | 66,832 | 188,500 | Sand and gravel, stone. |
| Gunnison | 1,607,274 | 1,642,084 | Coal, stone, zinc, sand and gravel, lead, silver, uranium ore, copper, gold, beryllium concentrate, gem stones. |
| Hinsdale | 7,725 | 10,012 | Silver, gold, lead, copper. |
| Huerfano | 446,764 | (5) | Coal, clays, sand and gravel. |
| Jackson | 3,090,447 | [6] 3,004,214 | Petroleum, coal, fluorspar, sand and gravel, uranium ore. |
| Jefferson | 3,474,806 | 3,906,002 | Sand and gravel, uranium ore, clays, gold, stone, beryllium concentrate, silver, gem stones. |
| Kiowa | [4] 61,500 | 221,100 | Sand and gravel, petroleum. |
| Kit Carson | 14,300 | 29,801 | Sand and gravel, stone, gem stones. |
| Lake | 47,740,170 | 66,676,115 | Molybdenum, tungsten concentrate, pyrites, sand and gravel, lead, copper, silver, tin, gold, stone. |
| La Plata [4] | 271,799 | [4] 341,274 | Sand and gravel, coal, petroleum, stone. |
| Larimer [4] | 12,375,638 | 12,614,445 | Cement, stone, sand and gravel, petroleum, gypsum, mica (scrap), beryllium concentrate. |
| Las Animas | 9,049,697 | 6,662,062 | Coal, sand and gravel, clays, carbon dioxide, stone, uranium ore. |
| Lincoln | 53,200 | 146,650 | Sand and gravel, stone. |
| Logan [7] | [6] 15,397,550 | 13,393,100 | Petroleum, sand and gravel. |
| Mesa [6] | 4,875,734 | 4,364,110 | Uranium ore, sand and gravel, coal, stone, clays, gem stones, beryllium concentrate. |
| Mineral | 1,020,577 | 1,398,533 | Lead, zinc, silver, copper, sand and gravel, gold, gem stones. |
| Moffat [10] | 6,614,921 | 8,134,815 | Petroleum, uranium ore, coal, sand and gravel, stone, gold. |
| Montezuma [4] | 1,395,644 | [6] 1,049,607 | Sand and gravel, petroleum, carbon dioxide, uranium ore, gem stones. |
| Montrose [6] | 10,903,704 | [6] 11,125,164 | Uranium ore, coal, salt, stone, sand and gravel, gem stones, copper, silver. |
| Morgan [7] | [6] 25,449,473 | 26,847,000 | Petroleum, sand and gravel. |
| Otero | 116,479 | 197,831 | Sand and gravel, stone. |
| Ouray | 4,030 | 168,663 | Lead, zinc, copper, silver, gold, sand and gravel. |
| Park | [8] 372,898 | 53,042 | Beryllium concentrate, zinc, copper, stone, lead, sand and gravel, gem stones, silver, gold, uranium ore. |
| Phillips | 1,545 | (5) | |
| Pitkin | (5) | (5) | Coal, sand and gravel, lead, zinc, silver, uranium ore, copper. |
| Prowers | 86,183 | 86,600 | Sand and gravel. |
| Pueblo | (5) | (5) | Sand and gravel, clays, stone, uranium ore. |
| Rio Blanco [10] | [6] 59,818,637 | 57,225,660 | Petroleum, uranium ore, coal, sand and gravel, gem stones. |
| Rio Grande | 10,000 | 1,150 | Sand and gravel, gem stones. |
| Routt | 1,865,003 | 2,390,019 | Coal, petroleum, sand and gravel, pumice, stone. |

**TABLE 17.—Value of mineral production in Colorado, by counties[1]—Continued**

| County | 1959 | 1960[2] | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Saguache | $1,776,590 | $1,650,855 | Uranium ore, gem stones, sand and gravel, zinc, lead, silver, copper, gold. |
| San Juan | [6] 92,816 | 300,772 | Copper, lead, silver, gold, zinc, sand and gravel, iron ore, gem stones. |
| San Miguel[6] | 10,042,933 | 11,745,179 | Uranium ore, zinc, lead, copper, gold, silver, iron ore, sand and gravel, stone, gem stones. |
| Sedgwick[4] | 60,900 | 31,860 | Sand and gravel, gem stones. |
| Summit | 72,015 | 591,718 | Sand and gravel, gold, lead, silver, copper. |
| Teller | 1,165,950 | 1,219,496 | Gold, stone, peat, silver, gem stones, sand and gravel. |
| Washington[7] | [6] 19,727,350 | 23,215,048 | Petroleum, sand and gravel, stone. |
| Weld[4] | 9,507,101 | [8] 8,380,730 | Petroleum, coal, sand and gravel, stone, gem stones. |
| Yuma | 574,967 | 138,900 | Sand and gravel, petroleum, gem stones. |
| Undistributed[11] | [6] 32,219,751 | 43,269,672 | |
| Total[12] | [8] 314,677,000 | 342,223,000 | |

[1] Denver County is not listed because no production was reported.
[2] Petroleum value is preliminary.
[3] Excludes natural gas liquids.
[4] Excludes natural gas.
[5] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[6] Excludes vanadium.
[7] Excludes natural gas and natural-gas liquids.
[8] Revised figure.
[9] Excludes natural gas and vanadium.
[10] Excludes natural gas, natural gas liquids, and vanadium.
[11] Includes vanadium, natural gas, natural gas liquids, some sand and gravel and gem stones and values indicated by footnote 5.
[12] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.

The entire output of gold and silver was recovered as a byproduct of the washing and screening of sand and gravel at six operations. Kerkling & Slensker recovered gold and silver from gravel sluiced from the Boise Cascade Sand & Gravel pit, F. S. Rizzuto Gravel pit, and Brannan Pits Nos. 8 and 10; Robert B. Ray from Clear Creek Rock Products Co. gravel pit; and Cooley Gravel Co. from its North Plant pit.

A public purchase depot and plant maintained in Arvada by Beryl Ores Co. for beryl and other beryllium-bearing ores was equipped to inspect and analyze beryllium-bearing ores and to crush and grind these ores for the varied requirements of the ceramic industry. The Beryl Ores Co. also was equipped to produce beryllium basic acetate, an important compound of high-purity beryllium, to make other beryllium compounds on order, and to grind mica for the roofing and paint industries.

**Alamosa.**—Oriental Refining Co. operated its 1,100-barrel-a-day refinery at Alamosa. Throughput was 274,000 barrels of crude oil, a slight decline from that of 1959.

**Arapahoe.**—Sand and gravel continued to dominate the mineral industry of the county. Nine commercial and Government-and-contractor operations produced 13 million tons of aggregate valued at $1.4 million. Cooley Gravel Co., with plants at Englewood and Littleton, was the major mine operator. Other important producers were Colorado Materials Co. and Herbertson Sand & Gravel Co.

**Archuleta.**—Petroleum production from 35 wells in 2 fields was 10 percent below that of 1959.

**Baca.**—Natural gas was produced at the Greenwood and Prairie Dog fields. One new field (Midway) was discovered when Horizon

| Undistributed[11] | [5] 32,219,751 | 43,269,672 | |
| Total[12] | [5] 314,677,000 | 342,223,000 | |

[1] Denver County is not listed because no production was reported.
[2] Petroleum value is preliminary.
[3] Excludes natural gas liquids.
[4] Excludes natural gas.
[5] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[6] Excludes vanadium.
[7] Excludes natural gas and natural-gas liquids.
[8] Revised figure.
[9] Excludes natural gas and vanadium.
[10] Excludes natural gas, natural gas liquids, and vanadium.
[11] Includes vanadium, natural gas, natural gas liquids, some sand and gravel and gem stones and values indicated by footnote 5.
[12] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.

The entire output of gold and silver was recovered as a byproduct of the washing and screening of sand and gravel at six operations. Kerkling & Slensker recovered gold and silver from gravel sluiced from the Boise Cascade Sand & Gravel pit, F. S. Rizzuto Gravel pit, and Brannan Pits Nos. 8 and 10; Robert B. Ray from Clear Creek Rock Products Co. gravel pit; and Cooley Gravel Co. from its North Plant pit.

A public purchase depot and plant maintained in Arvada by Beryl Ores Co. for beryl and other beryllium-bearing ores was equipped to inspect and analyze beryllium-bearing ores and to crush and grind these ores for the varied requirements of the ceramic industry. The Beryl Ores Co. also was equipped to produce beryllium basic acetate, an important compound of high-purity beryllium, to make other beryllium compounds on order, and to grind mica for the roofing and paint industries.

**Alamosa.**—Oriental Refining Co. operated its 1,100-barrel-a-day refinery at Alamosa. Throughput was 274,000 barrels of crude oil, a slight decline from that of 1959.

**Arapahoe.**—Sand and gravel continued to dominate the mineral industry of the county. Nine commercial and Government-and-contractor operations produced 13 million tons of aggregate valued at $1.4 million. Cooley Gravel Co., with plants at Englewood and Littleton, was the major mine operator. Other important producers were Colorado Materials Co. and Herbertson Sand & Gravel Co.

**Archuleta.**—Petroleum production from 35 wells in 2 fields was 10 percent below that of 1959.

**Baca.**—Natural gas was produced at the Greenwood and Prairie Dog fields. One new field (Midway) was discovered when Horizon

Digitized by Google

Oil & Gas Co. completed the No. 1–22 Cogburn well in October. The well flowed 8.4 million cubic feet of gas a day from the Topeka at a depth of 3,031 to 3,056 feet and from the Morrow at a depth of 4,674 feet.

**Bent.**—Petroleum production from that part of the McClave field lying within the county increased sixteenfold over that of 1959. Carbon dioxide from wells in Las Animas County was processed at Ninaview.

**Boulder.**—Although nonmetals continued to supply most of the total value of mineral production, their contribution decreased to 85 percent as a result of reduction in the output of sand and gravel and stone plus an increase in mine shipments of uranium ore. General Chemical operated its Burlington fluorspar mine and Valmont mill at about the same rate as that reported in 1959. Colorado Brick Co. and Eldorado Clay Co. mined fire clay and miscellaneous clay at their Valmont, Longmont, and Nos. 1 and 2 claypits at an increased rate. Boulder Gravel Products, Inc., Golden Transfer Co., Pendleton Construction Co., and C & M Sand & Gravel Co. produced nearly all the 526,900 tons of sand and gravel reported.

Boulder Gravel Products, Inc., recovered small quantities of gold and silver as byproducts of the washing and screening of sand and gravel at its Geo. Sawhill Ranch pit. Silver ore containing, in addition to silver, small quantities of gold, copper, and lead was produced and marketed from the Blue Bird mine. No tungsten ore or concentrate was produced or shipped from Boulder County tungsten deposits during the year; however, rejects from the Climax mill (Lake County) were re-treated by Earl Sweeney in the Marion mill, and the resultant tungsten concentrate was marketed.

Petroleum production from the Boulder field was approximately the same as in 1959. Uranium ore produced by La Salle Mining Co. at the Fair Day mine was shipped to Salt Lake City, Utah, for processing. Peat humus was mined for use as a soil conditioner.

**Chaffee.**—The chemical and construction materials—feldspar, stone, and sand and gravel—provided most of the value of mineral output. M. & S., Inc., operated its Homestake feldspar mine, shipping the crude ore to the Salida mill of Western Feldspar Milling Co. The Monarch quarry of CF&I contributed most of the stone output. Colorado Granite Co. quarried a small quantity of monumental granite, and Bailey Manufacturing Co. produced crushed granite for use as poultry grit. Construction crews of the State and county highway departments and the Hart Rok Redi Mixt Concrete Co. produced the 100,800 tons of sand and gravel recorded.

The Double R Mines worked the Mine Site Lode during the year and shipped 11,519 pounds of beryl concentrate to the Government purchase depot at Custer, S. Dak.

**Clear Creek.**—Most of the gold, silver, copper, lead, and zinc output in the county was recovered from lead ore produced from the Jackpot Oil Co. Bald Eagle mine by P. G. Leavitt and Milton George, lessees. These metals also were recovered from cleanup material from the Eagle mill and from ore produced from six other active mines—Ashland, Burleigh Tunnel, Dixie, Drummond, Franklin Claim No. 73, and Kitty Clyde.

Digitized by Google

Stony Point Development, Inc., produced and shipped brown iron ore (limonite) from the Geneva mine to Columbia Carbon, Monmouth, N.J., for use in manufacturing paint.

Uranium ore produced at the Little Warrior mine by Seacol, Inc., was shipped to Canon City for processing.

**Costilla.**—Increased shipments of pumice (scoria) by Colorado Aggregate Co., Inc., reversed the downward trend of the past few years. The Mesita Hill deposit near Mesita was the source of the scoria. Concrete admixture, insulation, and roofing aggregate were the end uses for 1960 shipments.

**Custer.**—The Rosita perlite mine, leased by Persolite Products, Inc., was operated at relatively the same rate as in 1959. Crude material was trucked to Florence for expanding; building plaster, insulation, concrete, and aggregate were the principal uses for the finished product. Ralph J. Pierce reported production of 2,000 tons of fire clay from the Lawson Place deposit.

**Delta.**—Coal production from seven underground mines was slightly above that of 1959. The major producer was the Juanita Coal & Coke Co. at the King mine.

**Denver.**—Five petroleum refineries in the Denver area operated throughout the year. Throughput was 11.7 million barrels, a 1-percent increase over that of 1959. Continental Oil Co. completed the addition of 2,000 barrels a day of vacuum capacity at its 18,000-barrel-a-day plant at Denver.

**Dolores.**—The Rico Argentine Mining Co. reported to stockholders that 14,653 tons of lead-zinc ore was mined and milled during the fiscal year ending June 30, 1960. Of this quantity, 8,465 tons was produced from the Mountain Springs area and the remainder from the Argentine area of the mine. The mill was operated at about 40 percent capacity. From the ore milled, 2,270 tons of lead and zinc concentrates containing 53 ounces of gold, 50,200 ounces of silver, 905 tons of lead, and 641 tons of zinc was shipped to smelters. Development work in the mine included 1,823 feet of drifts and crosscuts, 984 feet of raises, and 113 feet of long-hole drilling.

Rico Argentine also mined 36,426 tons of pyrite, virtually all from the Mountain Springs area of the mine. From this pyrite, 28,859 tons of 100-percent-basis commercial sulfuric acid was produced in the company plant at Rico. Ore storage bins, the crushing plant, and miscellaneous buildings, destroyed by fire January 30, were rebuilt during the year.

**Douglas.**—Increased value of the output of sand and gravel, stone, and clay boosted the total value of mineral production to $657,000, a gain of 50 percent. Hall Sand & Gravel Co. and Garfield Gravel, Inc., produced most of the aggregate quarried during the year. Robinson Brick & Tile Co. operated its Diamond, Ute, and Hogback mines. Denver Brick & Pipe Co. produced fire clay from the Ringenberg deposit, and Helmer Bros. and Stroud A. Whisenhunt mined fire clay from the Helmer and Stevens mines. Colonna Co. of Colorado, Inc., quarried and crushed granite for use as exposed aggregate in buildings, and Helmer Bros. reported the production of a small quantity of crushed limestone used as flux and for agricultural purposes.

Digitized by Google

**Eagle.**—Empire Zinc's Eagle mine led in output of zinc; ranked second in production of copper, lead, and silver; and ranked third in gold output in the State. It was closed by a labor strike for 4 months during the year. Production of direct-shipping copper-silver ore was below that of 1959 because this type of ore did not occur in the new area of the mine opened. Exploration and development on lower levels continued throughout the year.

Mine production of scoria was only half that of 1959 and resulted from cutbacks at the Dotsero and Carbondale deposits of Lava Products, Inc., and Roaring Fork Pumice Co. The Lava Products plant was shut down part of the year to complete an expansion program.

**El Paso.**—Although the value of output dropped 19 percent from 1959, mineral-production activity again was dominated by the sand and gravel and stone industries. The county ranked third in the State in the quantity of sand and gravel produced. Government-and-contractor production amounted to 54 percent of the 1.4 million tons output; seven commercial operators quarried 635,000 tons of building and paving sand and gravel. Castle Concrete Co., Colorado Lime Co., and Colorado Materials Co. mined crushed limestone; and Colonna Co. of Colorado, Inc., produced crushed granite. Increased shipments of clay were reported. The producers were National Clay Products Co. (National mine), Robinson Brick & Tile Co. (Apache), and Standard Fire Brick Co. (Husted). Colorado Lime Co. nearly doubled its output of quicklime and hydrated lime from its Pikeview operation.

**Fremont.**—The effect of cement-manufacturing activities on the mineral industry was evident again in 1960. The total value of mineral production decreased to $11.1 million, a decline of 19 percent, chiefly because of reduced shipments of cement from the Portland plant of Ideal Cement Co. Attendant to cutbacks in cement production and shipments was reduced quarry output of limestone used in manufacturing cement. Crushed limestone output was also reported by CF&I, Colorado Limestone Co., and Frank H. Norberg Co.; flux and sugar refining were the principal uses. Colonna Co. of Colorado, Inc., and Cowan Bros. produced crushed and dimension marble and granite. Fire clay production was reported by Ralph J. Pierce from the Flint, Salt Canyon, and Stage Coach Road mines; by George O. Stroup from the 8-Mile and Phantom Canyon mines; and by Irwin Clay Co. from the Irwin pit. Glen Lamberg & Sons mined 1,000 tons of bentonite from the Triangle-Lamberg group of claims. Fibreboard Paper Products Corp. operated its Florence wallboard and plaster-products plant using crude gypsum from a deposit near Cotopaxi.

Mary Lee Mining Co. recovered beryl from the Mary Lee and Mica Lodes, and Lockhart & Ellis worked the Mica Lode for beryl; all output was sold to the Government at its Custer, S. Dak., depot.

Coal production, from 20 underground and 2 strip mines, increased 7 percent over that of 1959. Major producers were The Corley Co. at the Pioneer Canon Nos. 1 and 2 and the Corley Strip mines, Vento Coal Co. at the Vento, and Beer Coal & Construction Co. at the Beer Strip. The tipple at the Vento mine was destroyed by fire in January. Fremont County ranked fifth in the State in the production of

Digitized by Google

coal. Petroleum production from 28 wells in the Florence-Canon City field was 31 percent below that of 1959. Uranium ore was produced at 16 operations and increased 74 percent in quantity and 47 percent in value over that of 1959. Major producers were Cotter Corp. at the Picnic Tree and Red Cliff mines; Gunnison Mining Co. at the Last Chance and from land leased from the State Land Board; and Juniper Oil and Mining Co. at the Snooper, Thorne, and Dickson Lease mines. The output was processed at mills in Canon City and Gunnison. The Cotter Corp. operated its uranium-processing mill at Canon City throughout the year, using crude ore mainly from the Front Range and adjoining counties.

**Garfield.**—Frank H. Norberg Co., operating the Glenwood Springs limestone quarry, produced all the stone in Garfield County in 1960. This limestone was used in sugar refining and road construction, as a flux, and for manufacturing lime. Basic Chemical Corp. tripled its output of quicklime and hydrated lime at its Glenwood Springs plant.

Natural gas was produced from 17 wells in 7 fields. Two discoveries were credited to the county. In December, Argo Oil Co. completed a well in the South Baxter Pass area, northeast of the South Baxter Pass field, discovered in 1959. Initial flow was 1.7 million cubic feet of gas a day from the Morrison at a depth of 6,959 to 7,182 feet. Also in December, Mountain States Drilling Co. completed the No. 1 Boulton, which flowed 850,000 cubic feet of gas a day from the Divide Creek at a depth of 7,526 to 7,886 feet. The well was 4 miles north of the northernmost producer at the Divide Creek field and 4 miles east of the Baldy Creek field, with no intervening wells. Coal production from five mines was 12 percent below that of 1959. Major producers were Bendetti Bros. at the New South Canon mine and William Haas, Jr., at the Black Raven mine. Union Carbide Nuclear Co. operated its 1,000-ton-a-day uranium mill at Rifle. Crude ore came from mines in Colorado, Utah, and Wyoming and upgraded material from a beneficiating plant at Slick Rock in San Miguel County. The purchase contract for uranium oxide with AEC, scheduled to expire on March 31, 1962, was being negotiated for the 1962–66 period.

**Gilpin.**—Peat humus was mined from deposits near Black Hawk for use as a soil conditioner and as a fertilizer admixture.

Gold, silver, and lead were recovered from ore produced from the Lone Star mine and treated in the Marion mill. Two gold-silver placer mines, Ralston Creek Placer and Smith Tyler, were active part of the year.

**Gunnison.**—Coal production from eight mines was 3 percent above that of 1959. The major producer was Minerals Development Corp. of Colorado, operating the Oliver No. 3 and Somerset mines. A part of the production from the Oliver No. 3 was transported by conveyor belt to the Western Colorado Power Co. Oliver powerplant at Somerset. Production from the Somerset mine was shipped to Utah for manufacturing coke. Bear Coal Co. operated the Bear mine, and Champion Coal Mining Co. operated the Hawk's Nest mine. Uranium ore produced by Cotter Corp. at the Big Red mine was processed at a company-owned plant at Canon City. Gunnison Mining Co. operated

Digitized by Google

its 200-ton-a-day acid-leach recovery mill at Gunnison. The uranium oxide purchase contract with AEC, which was to expire on March 31, 1962, was extended to December 31, 1962.

The leading producer of silver, copper, lead, and zinc in the county was the Standard Metals Corp. Micawber mine. The ore mined was treated in the company mill at Crested Butte, and the copper-lead, lead, and zinc concentrates produced were shipped to various smelters for recovery of the metals. Other active mines producing one or all of these metals included the Baxter Lode, Endner, Gold Links, and Little Darling.

George B. Tucker recovered a small quantity of beryl from the Monazite Lode and shipped the hand-cobbed concentrate to Custer, S. Dak.

**Hinsdale.**—The entire mineral output consisted of gold, silver, copper, and lead recovered from ore and mine-dump material from the Pelican mine and ore from the Never Sweat mine.

**Huerfano.**—Coal production from seven mines was slightly above that of 1959. Major producers were Delcarbon Coal Co. at the Calumet No. 2, Morning Glory Coal Co. at the Morning Glory, Red Ash Coal Co. at the Maitland No. 2, and Vista Coal Co. at the Gordon. Fire destroyed the tipple at the Maitland No. 2.

The Chamblin mine of Standard Fire Brick Co. continued as the only source of clay. Sand and gravel output was reduced to 3,200 tons of paving gravel that was produced by a contractor for the Colorado Department of Highways.

**Jackson.**—Petroleum production from 45 wells in 4 fields was 9 percent below that of 1959. Major production came from the McCallum and South McCallum fields. Carbon dioxide (77.9 billion cubic feet) produced at the McCallum and South McCallum fields was vented. Coal production at the Rosebud strip mine was 42 percent above that of 1959. The operation was abandoned in midyear. Pioneer Exploration Co. mined uranium ore at the Hume mine and shipped it to Rifle and Maybell for processing.

A small quantity of acid-grade fluorspar was shipped from stock by Ozark-Mahoning Coal Co. at Cowdrey.

**Jefferson.**—Jefferson County ranked second in the production of sand and gravel, the county's principal mineral product. Output was valued at $1.8 million. The leading producers were Rio Grande Gravel Co., Table Mountain, Inc., Asphalt Paving Co., Western Paving Construction Co., L. H. Kilgroe, and Brannan Sand & Gravel Co., each of which produced over 100,000 tons of aggregate.

The county was also the principal source of clays used for manufacturing building brick and other clay products. Denver Brick & Pipe Co. operated the Caldwell Nos. 4 and 71 and Strainland mines, Denver Fire Clay Co. operated the North and South Golden mines, Robinson Brick & Tile Co. operated the Lariat and Chieftain deposits, and Lakewood Brick & Tile Co. operated the Lindsay and Lakewood claypits. The following mine operators produced clay for sale to brick plants in the Denver metropolitan area: Garnett C. Bennetts (Leyden and Ramstetter pits), Duane J. Bruno (Mount Carbon mine), Wesley Conda (State and Church pits), Leland Doughty (Doughty claim), George W. Parfet Estate, Inc. (Rockwell-Apex-

Digitized by Google

Green Mountain deposits), John L. Harvey, and H. M. Rubey Clay Co.

Beryl recovered from the Beggar mine by Fred H. Olmstead was sold to Mincon at Loveland. The W. O. W. mine was worked for a short period by Ben Walz, and 333 pounds of beryl concentrate was sold to Beryl Ores Co. at Arvada.

Of the 10 operations producing uranium ore, major producers were Denver-Golden Corp. at the Schwartzwalder, Foothills Mining Co. at the Wright lease, and Yellow Queen Uranium Co. at the Ascension mine. The output was shipped to processing mills at Gunnison and Canon City; Riverton, Wyo.; and Salt Lake City, Utah.

Gold and silver were recovered as byproducts at three sand and gravel washing and screening plants: Brannan Sand & Gravel Co. Pit. No. 11, the Rio Grande Gravel Co. W. P. Kerkling placer pit by Kerkling & Slensker, and the Suburban Sand & Gravel Co. pit by Robert R. Ray.

**Kiowa.**—Petroleum production from the Brandon field increased fourfold over that of 1959.

**Lake.**—The entire molybdenum production of Colorado came from the Climax mine of Climax Molybdenum Co. Tungsten, tin, and pyrite recovered as byproducts of the molybdenum ore were marketed. Some of the pyrite produced was sold to a Denver plant for use in manufacturing sulfuric acid.

**La Plata.**—Petroleum production, from eight wells in the Red Mesa field, increased slightly over that of 1959. Natural gas was produced from 250 wells in the Ignacio-Blanco; producing formations were the Mesaverde (195 wells), Fruitland-Pictured Cliffs (36 wells), and Dakota (19 wells). The Barker Dome and Alkali Gulch fields, with four wells each, produced natural gas from the Paradox formation. El Paso Natural Gas Co. operated its Ignacio natural gas plant near Durango. The plant extracted natural gas liquids from products of natural gas fields in Colorado and New Mexico. Throughput of gas from Colorado wells was 67 billion cubic feet (including dry gas passed through plant compressors); 709,500 barrels of natural gas liquids was recovered. Coal production from nine mines was 9 percent above that of 1959. Major producers were Victory Coal Co. at the Victory No. 3 mine, King Coal Co. at the King, and Peacock Coal Co. at the Peacock. VCA operated its 750-ton-a-day uranium-vanadium processing plant at Durango. Crude ore came from mines in Colorado, Arizona, New Mexico, and Utah. Vanadium was recovered from those uranium ores containing significant quantities of vanadium oxide. The value of the recovered vanadium was credited to the State of origin. Negotiations continued with AEC toward extending the uranium-oxide purchase contract that was to expire March 31, 1962.

**Larimer.**—An increase in the output of sand and gravel and a small gain in the value of cement shipments contributed a 2-percent rise in the value of mineral production over that of 1959. Although the quantity of cement shipped from the Boettcher plant of Ideal Cement Co. declined slightly, a higher average price resulted in the small overall gain in value of shipments. Crushed limestone, used in manufacturing cement and in refining sugar, was the principal stone quar-

Digitized by Google

ried. The county was the major source of dimension sandstone in the State. Quarrying was done by Colorado Stone Co. (Berthoud, Loveland, and Rose stone quarries), Jacobson-Lyons Stone Co. (Carter Lake), Arthur Ohline (Ohline), Neal Sprague (Berthoud Pink Stone), Sterling Contracting Co. (Wild North), Weaver Stone Co. (Weaver), and Wild's Stone Quarries (Wild South). Types of building stone produced were rough construction, rubble, rough architectural, sawed, dressed, and flagging. Crude gypsum used in manufacturing cement was mined by E. W. Munroe from a pit near Fort Collins. United States Gypsum Co. mined gypsum from its property near Loveland for consumption at its Loveland wallboard plant. Scrap-mica output, 340 tons, came from the Langston mine operated by Jolex Mica Co. and from an unnamed property operated by H. L. Mattox. The crude mica was ground at the Jolex mill near Fort Collins.

A total of 48,276 pounds of beryl concentrate was recovered from Larimer County pegmatites. The ore, averaging 9.82 percent BeO, was sold to Mincon and Beryl Ores Co.

Petroleum production, from 38 wells in 5 fields, was slightly below that of 1959.

**Las Animas.**—Coal production from eight underground mines was slightly above that of 1959. Major production came from the Allen and Frederick mines operated by CF&I and was used for manufacturing coke at its Pueblo steel plant, from Albert Iuppa & Son Coal Co. at the Starkville No. 4 mine, from Rapson Coal Co. at the Rapson mine, and from Peacock Coal Co. at the Peacock mine. The Frederick mine at Valdez was closed late in December. Because of a limited reserve, the mine had not been mechanized as had the Allen mine, and increasing costs dictated abandonment as the developed reserve approached exhaustion. Carbon dioxide was produced at the Ninaview field and transported by pipeline to a processing plant in Bent County.

**Logan.**—Logan County ranked fourth in the production of petroleum. Production, from 436 wells in 66 fields, was 13 percent below that of 1959. A total of 39 exploratory wells, about one-fifth of the exploratory drilling in eastern Colorado, was drilled in Logan County. Of these, one at the Chess field was successful. B. F. Allison completed the No. 1 Bollish-Ramey well in July. The discovery well pumped 90 barrels of oil a day from the J sandstone at a depth of 4,800 to 4,818 feet. By yearend, Creslenn Oil Co. completed the workover of a previous failure that offset the discovery to the northeast. The offset well pumped 15 barrels of oil a day from the J sandstone. Development drilling resulted in 20 successful wells scattered over a number of fields. A substantial number of the successful wells were in the Little Hoot and West Padroni fields. N. C. Ginther operated natural gas plants at the Little Hoot, Padroni, Lewis Creek, and Yenter fields. Throughput of the four plants was 10.1 billion cubic feet of gas with the recovery of 486,000 barrels of natural gas liquids. Kansas-Nebraska Natural Gas Co. operated a stripper plant which recovered 49,000 barrels of natural gas liquids, at the Mount Hope-Walker compressor plant.

Digitized by Google

**Mesa.**—Uranium-ore production, from 80 operations, was 17 percent below that of 1959; however, the grade of ore produced increased from 0.28 percent $U_3O_8$ in 1959 to 0.30 percent. Major producers were Beaver Mesa Uranium Co. at the Rajah group, Mark 2, J. W. L. Fraction No. 1, and John Brown No. 14 mines; Climax Uranium Co. at the Arrowhead group, Karns Incline, the Incline group, Crow's Nest, Blue Ribbon No. 2, Mineral Channel No. 3, October Adit, and Ronnie No. 2; and Union Carbide Nuclear Co. at the Sun Spot and Sun Spot No. 2, Thunder Cloud No. 1, Trojan No. 18, Mary No. 3, Lucky Boy, and At 05–1–36 mines. The entire production was processed at mills in Grand Junction, Rifle, Uravan, and Durango. Climax Uranium Co. operated its 330-ton-a-day plant at Grand Junction. The AEC uranium-oxide purchase contract with Climax Uranium Co., approved in July 1950 and expiring on July 31, 1960, was replaced with a continuing contract, to expire on December 31, 1966. The new contract reserved part of the mill capacity for processing appropriate quantities of ore from qualified independent producers and provided for delivery of approximately 2.6 million pounds of uranium oxide, valued at $21 million, between August 1, 1960, and December 31, 1966. The mill recovered vanadium from Colorado Plateau ores containing significant quantities of vanadium oxide.

Coal production from seven underground mines was 21 percent above that of 1959. At the Cameo mine, operated by Kerr Coal Co., the major producer, the coal was delivered from the mine by conveyor belt to the 44-megawatt Cameo powerplant operated by PSC. American Gilsonite Co. operated its processing plant at Gilsonite, near Fruita, producing gasoline, diesel fuel, and metallurgical coke from gilsonite mined in Utah. Plans were announced to double the capacity of the plant to 1,600 barrels of gasoline, 1,300 barrels of diesel fuel, and 350 tons of coke a day. Natural gas production came from the Asbury Creek, Bar X, Buzzard Creek, Highline Canal, and Mack Creek fields. Four development wells were successful.

Junction Brick & Tile Co. continued to quarry miscellaneous clay from a pit near Grand Junction. All output was used at the company plant in manufacturing building brick and other heavy clay products. For the first time in the history of the county, beryl concentrate was shipped to the Government purchase depot at Custer, S. Dak. Dale W. Poe recovered beryl from the Blue Gem No. 1 claim and Frank E. Long, from the Crystal and Tantalum Lode and the Zaro No. 1 Lode.

**Mineral.**—Most of the gold, silver, and lead, and all of the copper and zinc output from the county came from ore produced from the Emperius mine operated by Emperius Mining Co. This mine was the third largest producer of silver, lead, and zinc in the State. Gold, silver, and lead were recovered from ore produced from the Outlet mine by Outlet Mining Co. A small quantity of silver ore was shipped from the Holy Moses dump by Sublet Mining Co.

**Moffat.**—Coal production from the Red Wing mine, operated by Colowyo Coal Co., was 4 percent above that of 1959. Petroleum was produced at 100 wells in 10 fields, principally at Powder Wash, Danforth Hills, and Iles. Natural gas was produced from the Ace, Hiawatha, West Hiawatha, Powder Wash, Sugar Loaf, and Thorn-

Digitized by Google

burg fields. Extensive exploration and development drilling resulted in the completion of 21 exploratory and 18 development wells. In February, Pan American Petroleum Corp. completed a well in the Four Mile Creek area, just south of the Colorado-Wyoming State line and 2 miles north of the 1959 discovery. Initial production was 11 million cubic feet of gas a day from two horizons in the Lance formation at depths of 3,612 to 3,618 and 3,624 to 3,630 feet. Intex Oil Co. completed an exploratory well at the Big Gulch field in August. The well flowed 5.8 million cubic feet of gas a day from the lower Mesaverde and 1.8 million cubic feet of gas a day from the Frontier. Texaco, Inc., completed the No. 18 Government-Knowlton in the Moffat field early in the year. The well flowed 1,098 barrels of oil a day from the Weber at a depth of 5,975 feet, the first production from the Weber in the field. A southeast offset by Texaco, Inc., flowed 205 barrels of oil a day, also from the Weber, at a depth of 6,015 to 6,200 feet. A second discovery in the Weber was made at Danforth Hills field in November when Texaco, Inc., completed the No. 7 Government-Treleaven, which pumped 445 barrels of oil a day at depths of 8,123 to 8,133 and 8,172 to 8,182 feet. Continental Oil Co. completed the No. 1 Smith well in the Elk Springs field in January. Production was 3.3 million cubic feet of gas a day from the Dakota, the first in the field, at a depth of 3,703 to 3,706 feet. Mountain Fuel Supply Co. operated natural gas refrigeration plants at the Hiawatha and Powder Wash fields. Uranium ore was produced at 17 operations. The major producer was Trace Elements Corp., a unit of Union Carbide Nuclear Co. The corporation also operated its 300-ton-a-day acid-leach uranium-processing plant at Maybell. Negotiations continued for extending the uranium-oxide purchase contract with AEC beyond the expiration date of March 31, 1962.

**Montezuma.**—Petroleum production from five fields was 25 percent below that of 1959. The Goodman Point field was discovered when Thomas L. Nabers & Associates completed the No. 2 Rowley well in March. Initial production was 29 barrels of oil a day from the Paradox at a depth of 5,399 to 5,419 feet. Thirty-three exploratory and eight development wells were completed. Carbon dioxide was produced from the Mississippian limestone and Shinarump formations at the McElmo field by Three States Natural Gas Co. The gas was converted to dry ice at a plant at McElmo by Colorado Carbonics Corp. Uranium ore from the Blue Eagle mine was shipped to Durango for processing.

**Montrose.**—Montrose County led with 44 percent of all uranium ore produced in the State. Output came from 285 operations. Major producers were Union Carbide Nuclear Co., Climax Uranium Co., Worcester Mines, and The Golden Cycle Corp. These four companies supplied 88 percent of all uranium ore produced in the county. Union Carbide Nuclear Co. operated its 1,000-ton-a-day uranium-processing plant at Uravan. The plant also recovered vanadium from the Colorado Plateau ores containing significant quantities of vanadium oxide. No vanadium recovered from out-of-State ore was credited to the State of origin. Union Carbide continued negotiations with AEC concerning revision and extension of the uranium oxide purchase contract that was to terminate on March

Digitized by Google

31, 1962. VCA announced that a new uranium concentrator would be built at Naturita on the site of the plant that had been closed and dismantled in 1958 because of obsolescence. Coal production from the Navajo strip mine operated by Edna Coal Co. was more than double that of 1959. The coal was used at the Colorado-Ute Rural Electrification Administration (REA) steam powerplant at Nucla.

**Morgan.**—Petroleum production, from 296 wells in 35 fields, gained 7 percent over that of 1959. Much of the increase was from the successful secondary-recovery operation by waterflooding at the Adena field. The county was second in number of discoveries. The Hawthorne field, north of the Bijou area, was discovered when Richard F. Shaheen completed the No. 1 Loose well in June. The well pumped 50 barrels of oil a day from the D sandstone at a depth of 6,164 to 6,170 feet. An offset to the southwest was a failure. Richard F. Shaheen and Decker Drilling Co. established the Ditch field upon completion of the No. 1 Reed well in July, which pumped 100 barrels of oil a day from the D sandstone at a depth of 5,685 feet. Anschutz Drilling Co. discovered the Dike field, to the west, by completing the No. 1 Cook well in October. Initial production was 3 million cubic feet of gas and 50 barrels of condensate a day from the D sandstone at a depth of 6,259 feet. Kimbark Exploration Co. completed the No. 1 McVey well in the San Arroya Creek field near the southern edge of the county in November. The well pumped 13 barrels of oil a day from the D sandstone at a depth of 5,744 to 5,748 feet. Offset wells to the east and north were failures. In December, Ambassador Oil Co. completed the No. 1 Parachini well at the Track field a mile north of the North Bijou field. Initial production was 240 barrels of oil and 430,000 cubic feet of gas a day from the D sandstone at a depth of 6,050 to 6,055 feet. Stuarco Oil Co., Carver-Dodge, and HLM Drilling Co. completed a workover well near the Ashley field in December. The well, nearly a mile north of the Ashley field, pumped 126 barrels of oil a day from the D sandstone at a depth of 5,878 to 5,881 feet and was believed to be an outpost to the Ashley field. Development drilling was concentrated in the Bijou, North Bijou, and West Bijou fields where there were 11 new producers from the D sandstone. These fields, discovered in 1958, have yielded nearly 2 million barrels of oil through 1960. N. C. Ginther operated natural gas plants at the Bijou and Vallery fields, Pure Oil Co. at the Adena, and Loffland Co. at the Fort Morgan. Throughput at the plants was 12.3 billion cubic feet of gas, and 1.3 million barrels of natural gas liquids was recovered.

**Ouray.**—Culminating a 4-year deveolpment and construction program costing $2.5 million, the Camp Bird mine and new 500-ton-a-day flotation mill, owned by Camp Bird Colorado, Inc., began production October 10. Output of gold, silver, copper, lead, and zinc from this mine furnished a large part of the county's mineral production and accounted for the substantial increase in the total as compared with that of 1959. In addition, small quantities of these metals were recovered from ores produced from the Mountain Monarch, Bachelor, Dexter No. 3, Frances, Little Balm of Gilead, and Nancy Cleo mines.

**Park.**—Output of gold, silver, copper, lead, and zinc, valued at $7,165, was recovered from small lots of ore produced from four ac-

Digitized by Google

tive mines—the Betty, Evening Star, Little Star & Twinkle Lode, and Sweet Home.

The 265 tons of beryl and beryllium-bearing material mined and sold came from four mines. The Boomer and Redskin Lodes of the U.S. Beryllium Corp. were the major producers. The 530,000 pounds of concentrate recovered from these deposits contained 1,335 short-ton units of BeO. CYWYD Mining Co. from the J & S Lode and the Globe Hill Mining Co. from the Big Sheep Horn mine recovered beryl. Except for small quantities of beryl sold to the Government at Custer, S. Dak., and to Beryl Ores Co. at Arvada, all output was sold to Mincon at Loveland.

Uranium ore mined at the Last Chance mine was shipped to Canon City for processing.

**Pitkin.**—Coal production from five underground mines was 42 percent above that of 1959. Thompson Creek Coal and Coke Corp. operated the Thompson Creek Nos. 1, 2, 3, and 5 mines, and Mid-Continent Coal and Coke Co. operated the Dutch Creek mine. Uranium ore mined by Aspen Mines, Inc., at the Frying Pan group was shipped to Salt Lake City, Utah, for processing. Utex Exploration Co. recovered natural gas from a well 5 miles east of the Divide Creek field in Mesa County. Drillstem tests flowed at the rate of 3.1 to 3.4 million cubic feet of gas a day through open 2-inch tubing from the Cozette member of the Mesaverde.

Montezuma Industries, Inc., shipped a small quantity of silver-copper-bearing lead-zinc ore from the Tam O'Shanter mine near Ashcroft to the United States Smelting Refining and Mining Co. Midvale (Utah) mill for treatment.

**Prowers.**—Petroleum was produced at the Barrel Springs field. The No. 1 Kern well was drilled about midway between the Barrel Springs field and the McClave field to the northwest by Keith L. Rising; drillstem tests in the Morrow recovered gas-cut mud at a depth of 4,406 to 4,430 feet. As operator, Frankfort Oil Co. ran casing to 4,665 feet and swabbed 70 barrels of oil from the Morrow at a depth of 4,553 feet. Total depth of the well was 4,801 feet and testing was continuing at yearend.

**Pueblo.**—Uranium ore mined by Cliff & Creek Uranium Co. at the George Avery and Avery Ranch mines was shipped to Canon City for processing.

Fire clay was mined by General Refractories Co. (Turkey Creek), Harbison-Walker Refractories Co. (Miller and Blunt), Standard Fire Brick Co. (Rock Creek), Colorado Fire Clay Co. (Nellie-Helen), and Summit Pressed Brick & Tile Co. Output in 1960, only slightly above that of 1959, was used mainly in manufacturing refractory products.

**Rio Blanco.**—Petroleum production, from 498 wells in 7 fields, was 4 percent below that of 1959; however, the county continued to lead with 42 percent of the State output. Natural gas was produced at five fields and three oilfields. The secondary-recovery program at the Weber reservoir of the Rangely field unit operated by The California Co. continued as planned. Production of the unit was 16.4 million barrels, a daily average of 44,800 compared with 17.2 million barrels and a daily average of 47,100 in 1959. As of December 31, 30.5 million barrels of water had been injected into the reservoir, by means of 56

Digitized by Google

water-injection wells. In addition, approximately 100 million cubic feet of natural gas was being injected into the reservoir daily. Additional injection wells will be used as needed, and installation of additional pumps at the central water injection plant will increase injection capacity to 140,000 barrels of water a day.

Exploration was largely in the Douglas Creek, Fawn Creek, and Piceance Creek areas. In May, west of the Douglas Creek field, Gulf Oil Co. completed the No. 1 Dragon Trail-Government well, which flowed 1.2 million cubic feet of gas a day from the Emery. Three additional discoveries were made in the Emery at depths of 2,200 to 3,500 feet. J. H. Page completed the No. 13–1 Federal well in June with a flow of 224,000 cubic feet of gas a day; Beardmore Drilling Co. completed the No. 18–3 Government well in June with a flow of 2.1 million cubic feet of gas a day; and Utex Exploration Co. completed the No. 1–A Cathedral well in June with a flow of 1.9 million cubic feet of gas a day. In November, Apache Corp. completed the No. 1 Government-Watson well in the Douglas Creek area, which flowed 298,000 cubic feet of gas a day from the Emery at a depth of 2,760 to 3,040 feet. To the east in the Fawn Creek area, Equity Oil Co. completed two wells (No. 1 Greeno and No. 1 Ebler) in the Green River at a depth of 2,500 feet. The No. 1 Greeno well was reported as a gas well and the No. 1 Ebler as an oil well, but no production data were released. East of the Fawn Creek area, Equity Oil Co. completed the No. 8 Piceance well in the Green River at a depth of 3,107 feet. The well was completed as an oil well, but no production data were released. South of Fawn Creek, Shannon Oil Co. completed the No. 1 Government well in the Whiskey area in October. Initial production was 500,000 cubic feet of gas a day from Tertiary formations at a depth of 6,035 to 6,053 feet. The California Co. developed new methods of natural gasoline plant design at Rangely field. Absorbers were installed between the second and third stages of six scattered compressor stations used in injecting gas into the Weber pool as part of the secondary-recovery program. The company found that absorber oil could be pumped to the compressor stations and back to the main extraction plant at a cost lower than transferring the wet gas to the extraction plant and back to the compressor stations. Throughput of the satellite compressor stations with absorbers was 28 billion cubic feet of gas with the recovery of 870,827 barrels of natural gas liquids at the main extraction plant. By December 31, approximately 220 billion cubic feet of gas had been injected into the reservoir through 17 wells on the crest of the pool. Uinta Refining Co. operated the 1,700-barrel-a-day refinery at Rangely (operated by Wesco Refining Co. in 1959). Throughput was estimated at 120,000 barrels in both 1959 and 1960.

Uranium ore produced at 11 operations was shipped to plants at Rifle and Grand Junction for processing. The major producer was McAlester Fuel Co., operating the Butter Fly mine. Coal production by Jenkins & Mathis Coal Co. at the Rienau mine and M. E. Staley at the White River Fuel mine was 2 percent above that of 1959.

**Routt.**—Coal production by Dry Creek Coal Co. at the Cardinal and Routt Mining Corp. at the Keystone, both underground mines; Edna

Digitized by Google

Coal Co. at the Edna strip mine; and The Pittsburg & Midway Coal Mining Co. at the Osage strip, was 18 percent above that of 1959. The county ranked third in coal production.

Petroleum production, from 20 wells in 5 fields, was slightly below that of 1959. The North Sage Creek was discovered when Caswell Silver and J. L. Cramer completed the No. 1 Featherstone in October. The well pumped 32 barrels of oil a day from the Niobrara at a depth of 5,496 to 5,593 feet. A second well, being tested one-half mile to the north, reportedly had flowed at substantial rates from the Niobrara at yearend.

McCoy Aggregate Co. of Steamboat Springs mined scoria from a nearby deposit. Crude and prepared scoria was sold to consumers for use in manufacturing cinder block and for railroad ballast.

**Saguache.**—Uranium ore produced at six operations was shipped to plants at Canon City and Gunnison for processing. Major producers were Gunnison Mining Co. at the Los Ochos (Thornburg No. 1 and West) and Thornburg No. 2 mines, and Pinnacle Exploration, Inc., at the Erie No. 28 mine.

Superior Mines Corp., the principal producer of base-metal ores in the county in 1959, was inactive. J. D. Blunt, who operated the Warwick mine near Bonanza, was the largest producer of gold, silver, copper, lead, and zinc. Small lots of ores containing these minerals were produced from the Cocomonga and Copper Head mines in the Bonanza area and the Monon mine in the Embargo Creek area.

**San Juan.**—The total value of mineral production from the county tripled. This increase resulted chiefly from the recovery of substantial quantities of gold, silver, copper, lead, and zinc from ore produced from the Shenandoah mine by Standard Metals Corp., formerly Standard Uranium Corp. The ore was concentrated in the company's newly rehabilitated Central mill near Silverton. In addition, the company continued work on extending the American tunnel 4,800 feet and raising from it 480 feet to connect with the existing workings of the Sunnyside property.

Fall River Exploration & Mining Co. produced gold-silver-copper-zinc-bearing lead ore from the Little Dora mine and concentrated it in the Pride of the West mill, formerly owned by Argyle Mining & Milling Co. Smaller quantities of ore containing these metals were produced and marketed from the Brooklyn, Longfellow, and Osceola mines.

A. A. McCluskey produced brown iron ore (limonite) from the South Mineral Placer mine and shipped it to an eastern firm for use in manufacturing paint.

**San Miguel.**—Two-thirds of the total value of mineral production came from gold, silver, copper, lead, and zinc recovered mainly from ores produced from the Treasury Tunnel-Black Bear-Smuggler Union group of mines operated by Idarado Mining Co. This group, the State's leading silver, copper, and lead producer, ranked second in output of gold and zinc. According to the company annual report to stockholders, 432,750 tons of ore was produced in 1960, compared with 369,050 tons in 1959. The ore milled in 1960 averaged 0.054 ounces of gold and 1.71 ounces of silver per ton, 2.45 percent lead, 0.65 percent copper, and 3.62 percent zinc. During the year the company

Digitized by Google

purchased all of the neighboring mining properties and interests of Atlas Mining Co., where some ore had been developed in past years.

Most of the State's iron-ore production (shipments) came from the Iron Springs Placer operated by C. K. Williams & Co. and was used for making paint. A small quantity of brown iron ore was produced from the Iron Lode No. 3 by Theresa B. Robinson for use as a soil additive.

Production of uranium ore from 85 operations was 13 percent above that of 1959. The county ranked second in production of uranium ore. Major output came from the Deremo lease, Burro group, H. L. Bigler, and Norther group operated by Union Carbide Nuclear Co. and the Radium and Bean Patch mines operated by Dulaney Mining Co. The ore was shipped to mills at Uravan and Durango and to an upgrading plant at Slick Rock for processing. Union Carbide Nuclear Co. operated its upgrading plant at Slick Rock. The partly concentrated material from the plant was shipped to the mill at Rifle for further processing.

Exploratory drilling in that part of the Paradox basin lying within the county resulted in nine completions, of which three were discoveries in the southeast Lisbon area. In June, Pure Oil Co. completed the No. 1 McIntyre Canyon well, which flowed 3.4 million cubic feet of gas a day from the Mississippian at a depth of 8,780 to 8,901 feet. The well also tested the Devonian. The No. 2 McIntyre Canyon, 1 mile to the southwest, completed by Pure Oil Co. in April, flowed 6.2 million cubic feet of gas a day from the Mississippian at a depth of 8,674 to 8,784 feet, 6.7 million cubic feet from the Ouray (Devonian) at a depth of 8,821 to 8,862 feet, and 149 barrels of condensate a day from both zones. Total depth of the well was 9,170 feet. A third well in the area, the No. 3 McIntyre Canyon, 1.5 miles southeast of the No. 2 well and 2 miles south and slightly east of the No. 1 well, was completed by Pure Oil Co. at a depth of 9,524 feet. Initial flow was 6.4 million cubic feet of gas and 122 barrels of oil a day from the Mississippian. A fourth well, 1 mile northwest of the No. 1 well, was a failure. Belca Petroleum Co. drilled the No. 1 Egnar unit 2.5 miles south of the Pure No. 1 unit, and although not completed at the end of the year, a calculated potential of 11.7 million cubic feet of gas a day from 5 intervals in the Mississippian was reported.

**Summit.**—Five active lode mines furnished $3,100 of the $4,600 value of gold, silver, copper, and lead produced. The remainder came from gold and silver recovered from two placer-mining operations.

**Teller.**—Gold and silver output, which supplied $1.1 million of the $1.2 million value of mineral production, came from 12 active mines in the Cripple Creek district in 1960, compared with 17 in 1959. All of the operators shipped their products, either mine ore or mine dump material, to the Carlton mill for treatment. The Ajax mine, operated by The Golden Cycle Corp., was the State's leading producer of gold. Other important producers in the district were the Deadwood mine operated by The United Gold Mines Co. and the Free Coinage mine operated by Deadwood Leasing Co.

As quoted in The Golden Cycle Corp. annual report, 47,414 tons of mine ore and 5,245 tons of dump ore, having an average value of $20.45 per ton for both company and custom material, were treated

Digitized by Google

in the company's Carlton mill. Mine and dump ore and average value of ore treated in 1959 were 61,422 and 8,755 tons and $16.17, respectively. During 1960, 21,328 tons of ore averaging $21.24 per ton and 14,872 tons of ore averaging $29.87 per ton were produced by the company and by lessees, respectively, from the Ajax mine. The mine was operated on a 2-shift-a-day basis throughout the year. The underground electrical power system was converted from 30-cycle to 60-cycle current, enabling the company to use electric instead of air-operated pumps. This change increased pumping efficiency and reduced the cost.

The United Gold Mines Co. cited in its annual report that 4,186 tons of mine ore (with an average value of $10.84 per ton) and 2,799 tons of dump ore ($6.90 per ton) were produced from its operations in the Cripple Creek district. To gain access to new ore and to new areas for exploration, the company began to rehabilitate the Theresa shaft, a project it expected to complete in February 1961.

Peat humus was mined for use as a soil conditioner and as an admixture in fertilizer.

**Washington.**—Petroleum production, from 387 wells in 54 fields, was 17 percent above that of 1959. The county ranked third in the State with 17 percent of the total output. With six discoveries, Washington County led all eastern Colorado counties. Anderson-Pritchard Oil Co. worked over an old well about 1 mile south of the Plum Bush Creek field. This well, No. 2 MacNeill, was completed in May and pumped 251 barrels of oil a day from the J sandstone at a depth of 5,045 to 5,047 feet; the field was named the Ring. B. F. Allison drilled a west offset that pumped 192 barrels of oil a day from the J sandstone. Anderson-Pritchard Oil Co. completed a well south of the Allison well that pumped 37 barrels of oil on an 18-hour test from the J sandstone. An offset well to the east and two stepout wells to the west were failures. In October, Plains Exploration Co. completed the No. B–1 Knight well, discovery of the Sapphire field, 6 miles northeast of the Ring. The well pumped 93 barrels of oil a day from the J sandstone at a depth of 4,917 to 4,927 feet. An offset to the south pumped 105 barrels of oil a day. Offsets to the east and west and a stepout to the south were failures. Two discoveries were made farther to the north. In August, Tipps Drilling Co. completed the No. 1 Blake (Saddle field), which pumped 105 barrels of oil a day from the J sandstone at a depth of 4,958 to 4,961 feet. An offset to the west was a failure. The Lariat field was discovered in September when Kimbark Exploration Co. completed the No. 1 McFall-State well, which pumped 26 barrels of oil a day from the D sandstone at a depth of 4,983 to 4,989 feet. In June, 15 miles east and south of the Ring field, B. F. Allison and Dow & McHugh completed the No. 1 Ben Gay, which pumped 50 barrels of oil a day from the J sandstone at a depth of 4,680 to 4,682 feet. In December, Champlin Oil & Refining Co. completed the No. 1 Loudder, 2 miles south of the Lindon field. The well pumped 90 barrels of oil a day from the J sandstone at a depth of 4,660 to 4,665 feet. Two other discoveries that had no successful offsets were completed by B. F. Allison. The Arrow field was completed in December at the No. 1 Pan American State and flowed 4.2 million cubic feet

Digitized by Google

of gas a day from the J sandstone at a depth of 4.781 to 4, 783 feet. An unnamed field was completed in October at the No. 1 Brown with an initial production of 125 barrels of oil a day on pump from the D sandstone at a depth of 4,933 to 4,940 feet. Development drilling was scattered throughout the county; major attention was directed to the Lindon field where 12 new producers were completed, and to the Ruby with 5 new oil producers and 1 gas well. Akron Gasoline Co. operated a natural gasoline plant at Akron. Natural gas came from the West Xenia and Akron fields, and Continental Oil Co. processed natural gas from the Little Beaver field at its plant at Brush. Throughput was 2.6 billion cubic feet of gas with the recovery of 521,795 barrels of natural gas liquids.

**Weld.**—Coal production from six underground mines was 5 percent below that of 1959. However, the county led in coal production with 21 percent of the State total. The Imperial Coal Co. operated the Eagle and Imperial mines; The Clayton Coal Co., the Lincoln and Washington; Boulder Valley Coal Co., the Boulder Valley No. 3; and McNeil Coal Corp., the Sterling. Much of the coal was used at thermal powerplants. Petroleum production, from 112 wells in 26 fields, was 11 percent below that of 1959. Two discoveries were made from 11 exploratory wells drilled. In February, Pure Oil Co. completed the No. 1 Sweigard well at the New Raymer field, north of the Jackpot field. The well pumped 42 barrels of oil a day from the D sandstone at a depth of 6,224 to 6,227 feet. In April, Wentworth Drilling Co. completed the No. 1 McEndaffer at the Mantle field. The field is west of the Battle Canyon field and the discovery well flowed 1.5 million cubic feet of gas a day with some condensate from the J sandstone at a depth of 6,222 to 6,233 feet. The well was shut in, but the operator planned to reenter and attempt completion in the D sandstone. Drillstem tests of the D sandstone had shown a flow of 6.3 million cubic feet of gas a day. In June, Clayton Oil Co. and Jack Ladmer completed a southwest offset that pumped 68 barrels of oil a day from the D sandstone. Another well nearly a mile to the north of the No. 1 Sweigard well was a failure. No development drilling except that at the New Raymer field was done. Akron Gasoline Co. operated a natural gas plant at the Battle Canyon field. Throughput was 56.6 million cubic feet of gas with the recovery of 12,088 barrels of natural gas liquids.

**Yuma.**—Yuma County became a producer of petroleum when the Laird field near the Colorado-Nebraska State line was discovered in April. The field is 40 miles east of the nearest Colorado field (Hyde in Morgan County) and 25 miles from the nearest producing fields in Nebraska and Kansas. S. D. Johnson completed No. 1 State, the field opener, which pumped 11 barrels of oil a day from the Lansing-Kansas City at a depth of 4,721 to 4,733 feet. Tennessee Gas & Oil Co. completed the No. 1-Nicklas-A, a northwest offset, which pumped 15 barrels of oil a day also from the Lansing-Kansas City.

# The Mineral Industry of Connecticut

By Stanley A. Feitler [1]

VALUE of Connecticut's mineral production in 1960 was $15.3 million, an 18-percent increase over 1959, but 5 percent below the record year of 1957. Most mineral commodities were produced in larger quantities in 1960, but the principal gain was in stone and sand and gravel production which together accounted for 94 percent of the total value. Mineral producers found that although the level of consumption was high, average prices were unchanged or lower. As costs continued to increase, many operations had a lower profit-to-sales ratio, a condition not limited to the mineral industry in 1960.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Clays.**—Although seven companies mined miscellaneous clay during 1960 compared with five in 1959, fewer tons were produced. Part of the output was used in the manufacture of flowerpots, but most

**TABLE 1.—Mineral production in Connecticut [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Beryllium concentrate ..... short tons | 13 | $8 | 16 | $9 |
| Clays ..... do | 279,937 | 368 | 207,458 | 308 |
| Gem stones | (2) | 5 | (2) | 7 |
| Lime ..... short tons | (3) | (3) | 34,664 | 616 |
| Peat ..... do | 2,090 | 13 | (3) | (3) |
| Sand and gravel ..... thousand short tons | 4,749 | 4,912 | 6,575 | 5,960 |
| Stone ..... do | 4,462 | 7,088 | 5,057 | 8,313 |
| Value of items that cannot be disclosed: Feldspar, lime (1959), mica (1960), peat (1960), and items indicated by footnote 3 | ---------- | [4] 636 | ---------- | 140 |
| Total Connecticut [5] | ---------- | 12,930 | ---------- | 15,254 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Weight not recorded.

[1] Commodity-industry analyst, Bureau of Mines, Pittsburgh, Pa.

Digitized by Google

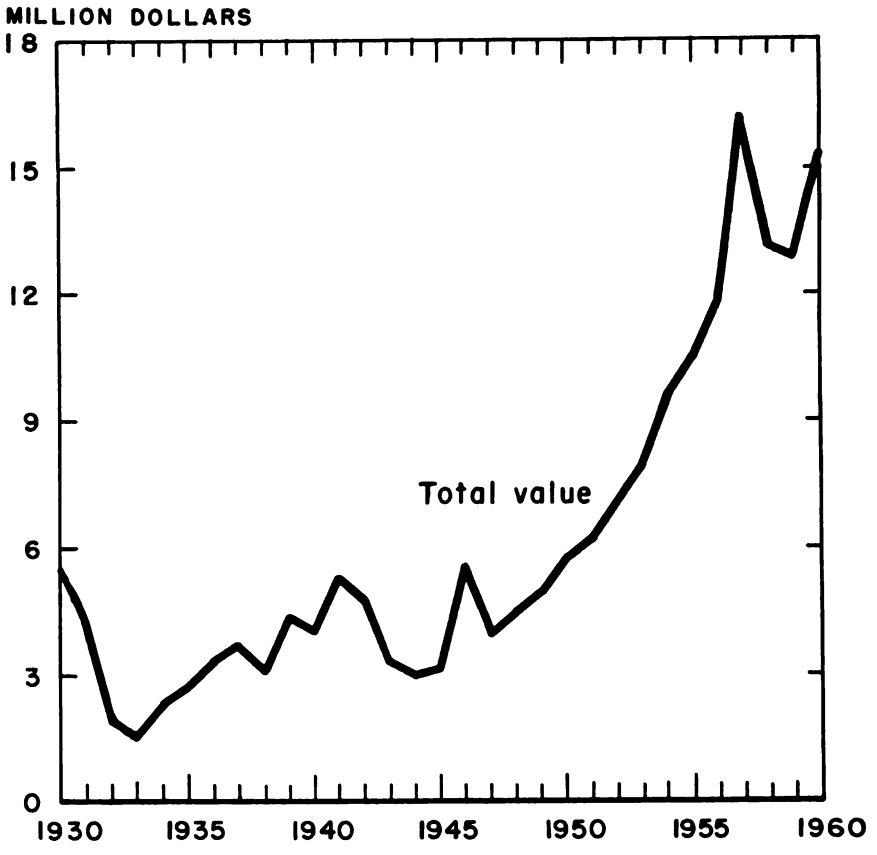

FIGURE 1.—Value of mineral production in Connecticut, 1930–60.

of the clay was used in the manufacture of building brick. The reduced production of miscellaneous clay was attributable to smaller demand for brick by the construction industry. The clay was mined by 15 men, who worked 24,000 hours and produced an average of 8.6 tons per man-hour. One lost-time injury was reported. Connecticut brick manufacturers formed the Brick Service and Development Association to assist and promote all phases of brick application.

**Feldspar.**—Feldspar production continued at about the same level as in 1959, with a small decrease in tonnage and a small increase in value. Grinding plants continued to obtain crude feldspar from nearby pegmatite bodies in Middlesex County. Selective mining was used to maintain uniform millfeed, and the crude material was dry ground to specifications established by consumers.

**Gem Stones.**—Collectors of mineral specimens and gem stones increased their activity, and the value of the material recovered was higher than in 1959. Pegmatites in the central and western counties continued to interest mineral and gem collectors as well as lapidary clubs, as they contain such a wide variety of rare minerals and gem stones.

Digitized by Google

**Lime.**—For the third successive year, output of lime exceeded that of the previous year. More than half the output was used in the manufacture of calcium and magnesium at Canaan; more than 40 percent was used as mason's lime. Lime was also used as a soil conditioner and in insecticides. More than 70 percent of the total tonnage was sold within the State.

**Mica.**—A small quantity of strategic-grade mica was recovered from two mines. It was sold to General Services Administration (GSA) at the Franklin, N.H., purchase depot.

**Sand and Gravel.**—Commercially produced sand and gravel increased 12 percent in tonnage and 8 percent in value, reflecting a lower price per ton for most uses. The average price per ton for gravel was down $0.12, and that for sand was up $0.01. A large increase in tonnage by Government-and-contractor operations was due in part to the expanded highway construction program and in part to improved canvassing methods. Material washed, screened, or otherwise prepared decreased from 84 percent of the total in 1959 to 78 percent. Deliveries of sand and gravel continued to be mainly by truck. Commercial producers employed 382 men, who worked 700,000 hours and produced 7.3 tons of finished product per man-hour.

**TABLE 2.—Sand and gravel sold or used by producers, by class of operations and uses**

| Class of operation and use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Commercial operations: | | | | |
| Sand: | | | | |
| Molding | | | 2,000 | $1,000 |
| Structural | 1,123,080 | $985,801 | 1,272,192 | 1,232,534 |
| Paving | 1,255,582 | 1,143,221 | 950,249 | 875,915 |
| Other | 100,924 | 109,818 | 135,749 | 120,548 |
| Gravel: | | | | |
| Structural | 948,418 | 1,440,543 | 1,013,016 | 1,461,801 |
| Paving | 609,458 | 727,786 | 922,468 | 1,076,217 |
| Fill | 207,271 | 140,116 | 355,838 | 219,802 |
| Other | 171,437 | 205,603 | 86,061 | 58,398 |
| Undistributed [1] | 161,473 | 91,651 | 377,726 | 197,492 |
| Total | 4,577,643 | 4,844,539 | 5,115,299 | 5,243,707 |
| Government-and-contractor operations: | | | | |
| Sand: Paving | 72,763 | 26,705 | 63,007 | 21,904 |
| Gravel: Paving | 98,313 | 41,219 | 1,396,739 | 694,370 |
| Total | 171,076 | 67,924 | 1,459,746 | 716,274 |
| Grand total | 4,748,719 | 4,912,463 | 6,575,045 | 5,959,981 |

[1] Includes filter sand, railroad ballast, and fill sand.

**Stone.**—Although basalt (traprock) represented most of the stone output, limestone, granite, and quartzite also contributed to the total stone produced. Increased tonnage and value was due partly to the accelerated highway construction program and partly to improved canvassing procedures. Crushed stone, mainly basalt, used principally for building and highway construction, accounted for 96 percent of the tonnage and 88 percent of the value of all stone in 1960. The average value of crushed stone was $1.61 per ton, an increase of $0.06 per ton compared with 1959.

Digitized by Google

TABLE 3.—Stone sold or used by producers, by uses

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Dimension stone (approximate short tons) | 6,730 | $174,426 | 6,628 | $158,944 |
| Crushed and broken stone: | | | | |
| Agstone | (1) | (1) | 62,441 | 286,000 |
| Concrete, roadstone | 4,084,999 | 5,916,239 | 4,714,944 | 7,076,804 |
| Railroad ballast | 58,002 | 70,641 | 47,465 | 59,332 |
| Riprap | 132,679 | 153,751 | 111,204 | 162,950 |
| Undistributed [2] | 179,727 | 773,415 | 114,781 | 568,709 |
| Total | 4,462,137 | 7,088,472 | 5,057,463 | 8,312,739 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[2] Includes ground quartz, flux, other stone, and items indicated by footnote 1.

Granite was quarried for dimension stone and monuments, but most of the tonnage was crushed. Limestone, used mainly for making lime, was also ground for agricultural and other uses. A major portion of quartzite production was used in manufacturing glass.

Commercial crushed stone producers employed 347 men, who worked 736,000 hours and produced 5.9 tons of finished stone per man-hour.

## METALS

Connecticut continued to be an important center for smelting and processing primary and secondary nonferrous metals, although sales were less than in 1959. Several plants were merged or purchased by others to improve operating economy or diversify products, and operations were discontinued at a few metal-processing plants. Research groups continued to work on projects aimed at improving processes and expanding uses for some of the rarer metals as well as the common nonferrous metals and alloys.

Principal yards dealing in iron and steel scrap were centered about Ansonia, Kent, Meriden, and New Haven in New Haven County and Bridgeport and Danbury in Fairfield County. Low prices and restricted demand by domestic consumers resulted in increased shipments for export, which accounted for 65 percent of all shipments from yards. The principal grades shipped, in order of decreasing tonnage, were No. 2 and all other bundles (mainly for export), No. 2 heavy-melting steel, No. 1 heavy-melting steel, and low-phosphorous scrap.

**Beryllium concentrate.**—Production of beryllium concentrate in the form of hand-cobbed beryl was higher than in 1959. Beryl from mines in three counties was sold at the GSA depot, Franklin, N.H. The material had an average beryllium oxide content of 11.4 percent.

## MINERAL FUELS

**Coke.**—The Connecticut Coke Co. plant (New Haven) of Eastern Gas & Fuel Associates continued to operate 70 Koppers-Becker by-product coke ovens having an annual capacity of 410,000 tons. Part of the output was used by the market vacated by Eastern Gas & Fuel Associates' Everett, Mass., plant, which had been discontinued.

Digitized by Google

Chemical byproducts produced at the New Haven plant included ammonium sulfate, crude coal tar, crude light oil, and intermediate light oil.

**Peat.**—Output of peat for use as a soil conditioner was greater than in 1959, although bogs in Hartford and Tolland Counties were idle. Connecticut production (all from Middlesex County) in 1960 had a higher average value per ton than in 1959.

## REVIEW BY COUNTIES

The Connecticut State Highway Department reported production of sand and gravel and crushed stone from unspecified counties. In Hartford County, the town of South Windsor and the Department of Public Works at Bristol reported production of sand and gravel by Government-and-contractor operations.

**Fairfield.**—With just under 1 million tons, Fairfield County was second in sand and gravel production. Ninety percent of the total output was used in building and highway construction, and the rest was used for fill and sanding roads. Among the more important producers were John Lomazzo & Sons Corp., Weston, Grasso Construction Co., Shelton, and Lambert, Inc., Brookfield. All sand and gravel produced was delivered by truck, and 85 percent was washed, screened, or otherwise prepared before shipment. The only limestone producer in the county, Connecticut Agstone Co., discontinued operations at its quarry near Danbury.

Gem and mineral specimens were collected at many localities. The Branchville pegmatite in Redding Township, long noted as the locality for a large variety of rare minerals, produced some of the rare manganese phosphates and the uranium minerals, autunite, torbernite, uraninite, and cyrtolite. Excellent specimens of clevelandite, apatite, garnet, and columbite-tantalite also were recovered.

A variety of steel products was produced at the Bridgeport plant of Carpenter Steel Co. of New England in two electric furnaces. Bridgeport Brass Co. bought the Seymour Manufacturing Co., Seymour, whose facilities and products put Bridgeport Brass Co. in such new product fields as phosphor bronze, nickel-silver alloys, nickel anodes, and bright nickel solutions.

**TABLE 4.—Value of mineral production in Connecticut, by counties**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Fairfield | $1,494,730 | $1,261,573 | Sand and gravel, gem stones. |
| Hartford | 3,703,447 | 4,474,450 | Stone, sand and gravel, clays, peat, gem stones. |
| Litchfield | 1,663,146 | 1,776,475 | Stone, lime, sand and gravel, beryllium, gem stones. |
| Middlesex | 553,517 | 497,982 | Sand and gravel, clays, feldspar, peat, beryllium, mica. |
| New Haven | 4,367,394 | 4,384,825 | Stone, sand and gravel, clays, beryllium, gem stones. |
| New London | 507,855 | 808,698 | Stone, sand and gravel. |
| Tolland | (1) | (1) | Sand and gravel. |
| Windham | (1) | (1) | Sand and gravel, stone. |
| Undistributed [2] | 639,424 | 2,049,911 | |
| Total | 12,930,000 | 15,254,000 | |

[1] Figure withheld to avoid disclosing individual company confidential data.
[2] Includes stone and sand and gravel that cannot be assigned to specific counties and values indicated by footnote 1.

Digitized by Google

H. K. Porter Co., Inc., Shelton, produced synthetic mullite for refractory uses. Kaolin from out of State with alumina added was fired at 3,250° F. in an 8- by 250-foot rotary kiln. Mullite so produced was fired in two tunnel kilns to produce high-grade refractory brick and block for use by the glass and steel industries.

Lambert, Inc., which began producing sand and gravel in 1959 with a 90-ton-per-hour plant, installed additional equipment in 1960 to increase capacity to 150 tons per hour. The sand and gravel was recovered from a glacial moraine.

**Hartford.**—Although output of basalt was down to 1.8 million tons, the county continued to rank second in the State in crushed stone production. Most of the crushed stone output was marketed for use in concrete and highway construction; a small quantity was sold for riprap. Six operators mined, crushed, and screened basalt during the year from three quarries near Plainville and one each near East Granby, Farmington, and Newington. Tower Hill Granite Co. and T. A. Armando, both near Glastonbury, produced granite for dimension stone.

Hartford County, with 1.6 million tons, was the leading producer of sand and gravel in the State. Most of the output was used for building and paving, but a minor tonnage was consumed in sanding roads, filtration, and as railroad ballast. Nineteen producers were active in the county, and 77 percent of their output was washed and screened.

Although more producers were active during 1960, output of miscellaneous clay was lower than in 1959. All of the output was used in the manufacture of building brick except a quantity sold by Eastern Brick Co. to the Keller-Whillden Pottery Co., Kensington, for use in making flowerpots.

Mineral collectors reported recovery of zeolites and calcite from vugs in the basalt near Farmington, and samarskite, garnet, and tourmaline from the Spinelli prospect near Glastonbury.

**Litchfield.**—Output of limestone increased over that of 1959 in both tonnage and value. The principal uses for limestone mined in the county were for agstone (for soil treatment) and the manufacture of lime. Smaller quantities were used for riprap, metallurgical flux, dead-burned dolomite, rubber filler, asphalt filler, pottery, stucco, and filler in plastic and paint. New England Lime Co. mined dolomitic limestone to supply its limekilns. More than half the total lime produced was quicklime used in manufacturing calcium and magnesium at the Nelco Metals, Inc., Canaan, plant of New England Lime Co. The other principal uses were for mason's lime and agricultural lime.

Seven pits produced sand and gravel for building, paving, and highway surface maintenance. Two of the operations were near New Milford; the others were near Canaan, Litchfield, Plainville, Lime Rock, and Torrington. Twenty-two percent of the output was sold as bank-run; the rest was washed and screened before shipment. Building Materials, Inc., continued to mine basalt for concrete, roadstone, and riprap at its Torrington quarry. Production was higher than in 1959.

Beryl concentrates were produced at Parker's quarry near North Woodbury and sold to GSA at the Franklin, N.H., purchase depot.

Digitized by Google

The hand-sorted material contained an average of 11.6 percent beryllium oxide. Gem and mineral collectors recovered aquamarine, tourmaline, and garnet in New Milford Township. Scovill Manufacturing Co., New Milford, produced copper tubing in newly installed tubemills.

**Middlesex.**—Sand and gravel production was lower than in 1959. The output, used for building, paving, fill, and ice control, was recovered from pits at East Hampton, Middletown, Madison, Clinton, Deep River, and Haddam. All deliveries were by truck, and 85 percent of the material was washed and screened before shipment.

The Michael Kane Brick Co., Middletown, reported increased production of miscellaneous clay to meet greater demand for building brick.

Crude feldspar requirements of the Eureka Feldspar Mining & Milling Co. were supplied by John W. Mance at the Hale pegmatite, where he produced the material under contract. The crude feldspar was trucked to the Eureka Co. grinding plant, where it was prepared for use by the ceramic industry. Worth Spar Co., Inc., continued to mine potash feldspar from a zoned pegmatite near Cobalt. The crude material was trucked to the company mill, where it was pulverized for use in floor-cleaning compound as an abrasive and nonskid additive.

Feldspar Corp. completed construction of its new mill south of the Connecticut River a few miles east of Middletown. This company, with several plants in the Southeast, had produced feldspar for more than 30 years. The new mill, with grinding and flotation sections through the shakedown operation, was ready at the end of 1960 to ship feldspar for use in the manufacture of glass and ceramics. Pegmatite bodies located from 500 to 1,500 feet from the millsite were developed for production. The company planned to market byproduct scrap mica and quartz.

Peat was recovered from bogs near Old Saybrook by E. C. McGuire & Son and Saybrook Peat, both of Old Saybrook. Production was maintained at a higher level than in 1959. The pegmatite dikes of Middlesex County continued to be popular with collectors as a source of a wide variety of gems and mineral specimens.

**New Haven.**—Almost half the stone produced in the State was mined in New Haven County from seven basalt quarries and one granite quarry. Ninety-eight percent of crushed stone sold for use as concrete aggregate and roadstone; the remainder was used for riprap and railroad ballast. Of the 2.1 million tons of crushed stone produced in 1960, 52 percent was shipped by truck, 37 percent by water, and 11 percent by rail. The rock was mined at two quarries near New Haven and one quarry each near Woodbridge, Meriden, Wallingford, and North Brandford. The New Haven quarry of the Foxon Traprock Co., Inc., was closed in July 1960. Through affiliation with the New Haven Traprock Co., New Haven, the Foxon Concrete Corp. continued to market concrete using crushed stone produced by New Haven Traprock Co. Castellucia & Sons, Inc., continued to produce rough architectural stone from its granite quarry at Brandford.

Digitized by Google

The county continued to rank third among the State's sand and gravel producing counties. The entire output was used for building, highway construction, and fill.

The Stiles Corp., North Haven, produced less miscellaneous clay for brickmaking than in 1959 because of the low level of demand in the first quarter and a strike in June. A 9- by 70-foot rotary dryer was installed to control moisture in the clay and thus to improve quality control and overall economy.

Burritt R. Curtis produced beryl at the Southford Pegmatite, Southbury, for the seventh consecutive year. The hand-sorted beryl, which contained 12.5 percent beryllium oxide, was sold to GSA at the Franklin, N.H., purchase depot. Gem and mineral collectors were active during the year, collecting specimens and gem material at many mineral localities in the county.

Chase Brass & Copper Co., Inc., Waterbury, a subsidiary of Kennecott Copper Corp., completed plans for installing new equipment to process copper tubing. Seymour Manufacturing Co., Seymour, manufacturer of phosphor bronze, nickel-silver alloys, nickel anodes, and bright nickel solutions, was acquired by Bridgeport Brass Co.

**New London.**—Connecticut Silica Co. increased production at its North Stonington quartzite mine to satisfy the demand for its products. The quartzite was crushed and ground to specifications for use in manufacturing glass and as foundry, abrasive, and plaster sand. The quartzite was also used for roofing granules and as a filler.

Barrett Division of Allied Chemical Corp. mined and crushed granite for use as concrete aggregate, roadstone, and riprap at its Montville quarry. The Millstone Granite Quarry, Inc., Waterford, quarried and prepared rough architectural stone, rough stone for monuments and mausoleums, and rough construction stone. Golden Pink Granite Quarry Co., New London, and E. Locarno & Sons, Niantic, produced rough monumental stone from granite quarries.

Sand and gravel was produced from five pits, two at Montville and one each at Yantic, Niantic, and Waterford. The material was used for building, paving, and fill, and for sanding roads.

**Tolland.**—Sand and gravel was produced by Earl L. Parker, Inc., Tolland, Myron M. Lee, Bolton, and Vernon Sand & Gravel Co., Vernon, for use in building, paving, and fill and for sanding roads. The Bonair Peat Co. of Ellington was inactive in 1960.

**Windham.**—Sand and gravel produced from pits near Putnam, Danielson, and Wauregan was used for building, paving, and railroad ballast. Concrete aggregate, roadstone, and railroad ballast were produced near Wauregan from crushed basalt. H. B. Marriott, Oneco, quarried granite to produce curbing and rubble.

# The Mineral Industry of Delaware

**This chapter has been prepared under a cooperative agreement between the Bureau of Mines, U.S. Department of the Interior, and the Delaware Geological Survey.**

By Robert D. Thomson [1]

THE VALUE of Delaware's 1960 mineral production declined to $989,000, 23 percent below 1959. Decreased demand resulted in a lower output of sand and gravel, stone, and clay.

Employment reported by the mineral industries totaled 71 production employees working 121,400 man-hours.

**TABLE 1.—Mineral production in Delaware [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Sand and gravel.....thousand short tons.. | 1,241 | $1,071 | 1,084 | $907 |
| Value of items that cannot be disclosed: Clays and stone | ---------- | 213 | ---------- | 82 |
| Total Delaware | ---------- | 1,284 | ---------- | 989 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Clays.**—Miscellaneous clay production decreased owing mainly to a continuing decline in demand for building brick. The clay produced in New Castle County was used at a local brick plant.

**Fluorspar.**—The St. Lawarence Fluorspar, Inc., plant at Wilmington was idle in 1960. When operating, it used flotation to produce acid-grade fluorspar concentrate from imported crude ore.

**Gypsum.**—Bestwall Gypsum Co. began constructing a gypsum products plant at the Wilmington Marine Terminal. The plant was to use gypsum obtained from company mines, including mines operated in Nova Scotia and the Dominican Republic.

[1] Supervisory commodity-industry analyst, Bureau of Mines, Pittsburgh, Pa.

Digitized by Google

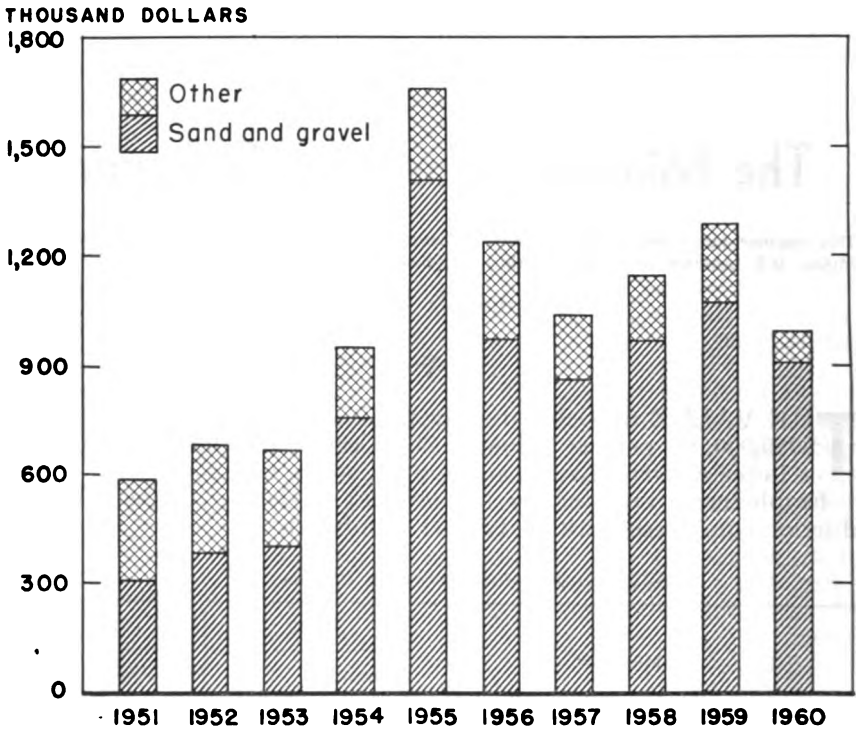

FIGURE 1.—Value of mineral production in Delaware 1951–60.

Allied Chemical Corp.'s Barrett Division began constructing a gypsum board plant at Claymont to utilize gypsum produced as a byproduct of wet-process phosphoric acid manufacture.

**Sand and Gravel.**—Sand and gravel continued to be the principal mineral industry in Delaware despite a drop of 13 percent in tonnage and 15 percent in value. No sand or gravel was produced by the State highway department, accounting in great measure for the decline. Commercial production of sand also decreased although gravel production increased. Sand was marketed as building, paving, and engine sand, and for fill. Gravel was marketed for building, paving, and fill. Of the total tonnage, sand and gravel for building purposes represented 12 percent and for paving purposes 79 percent. Less than half of the sand and gravel production was washed or screened, about 10 percent less than 1959. The entire output was transported by truck to consumers.

A daily average of 62 production employees worked a total of 104,000 man-hours during the year.

**Stone.**—Gabbro, classified as granite for statistical purposes, was the only stone produced in the State. It was crushed and shipped by truck for use as concrete aggregate and roadstone.

**Sulfur.**—Recovered elemental sulfur was produced by Tidewater Oil Co. at its Delaware City plant. The Claus process was used to re-

Digitized by Google

cover the sulfur from crude oil received from other States and foreign countries. Construction of a new naphthalene plant with an initial annual capacity of 100 million pounds was begun by Tidewater Oil Co. at this refinery.

### METALS

Colorado Fuel and Iron Corp. sold its Claymont mill to Phoenix Steel Corp. in October 1960. The plant, with an annual ingot capacity of 506,500 short tons, consisted of seven open-hearth furnaces; two plate rolling mills of 160- and 120-inch widths with a combined annual capacity of 300,000 tons; an electric weld mill for large-diameter pipe; a fabricating shop; and a flanging, pressing, and dished and spun head department. Pig iron was supplied by the Phoenix, Chester, Pa., blast furnace, 3 miles from Claymont.

Sinter was produced at Wilmington by Pyrites Co., Inc. Raw materials for the sinter were residue from a pyrite concentrate produced in Pennsylvania, aniline sludge, and flue dust. The sinter was used in making pig iron and steel. The Delaware works of General Chemical Division, Allied Chemical Corp. at North Claymont produced cinder for use in making pig iron and steel, cement, and refractories.

Iron and steel scrap was generated in Wilmington, Dover, and Smyrna. Shipments from yards consisted primarily of Nos. 1 and 2 Heavy Melting steel, No. 2 and all other bundles, cast-iron scrap other than borings, and unprepared scrap.

The New Castle plant of American Manganese Steel Division, American Brake Shoe & Foundry Co., and the Wilmington plant of North American Smelting Co. were also active during the year. The New Castle plant produced manganese steel castings and chrome molybdenum steel castings, and the Wilmington smelter and refinery, bronze, brass, aluminum, and zinc casting alloys, solder, babbitts, and type metal.

## REVIEW BY COUNTIES

**Kent.**—Sand and gravel was produced near Dover, Harrington, Milford, and Wyoming principally as building, paving, and fill material. Kent again ranked second as a mineral-producing county despite a 65-percent drop in sand and gravel production. St. Jones River Gravel Co. at Dover operated a stationary plant producing washed and screened materials. Fisher M. Carpenter produced bank-run gravel at Milford. Clough & Caulk Sand and Gravel marketed washed and screened sand and gravel; M. A. Hartnett produced bank-run sand. The Barber Sand and Gravel Co. dredge near Harrington produced sand for building purposes. The entire county output of sand and gravel was shipped to consumers by truck.

**New Castle.**—New Castle continued as the leading county in mineral production. Output of sand and gravel by commercial producers increased 27 percent over 1959. The sand and gravel produced was primarily paving and building material. Washed sand and gravel was produced from a stationary plant by Petrillo Bros., Inc., near Wilmington; Delaware Sand & Gravel Co., New Castle; and Whittington's Sand & Gravel Co., Bear. Delaware Sand & Gravel Co.

Digitized by Google

was the only one of the three that did not produce unprepared material. Parkway Gravel Co., Inc., operated the Cristine pit at Jefferson Farms, producing bank-run gravel, using a portable plant. The entire sand and gravel production in this county was shipped by truck.

Stone also was produced by the Petrillo Bros., Inc., from the multiple-bench Shellpot quarry near Wilmington. The crushed rock was transported by truck from a crushing plant to each project. Miscellaneous clay was produced by Delaware Brick Co. from an open pit near New Castle. The clay was loaded mechanically and transported to the plant—crushed, ground, and screened for use in producing building brick.

**Sussex.**—Output of commercial sand and gravel in Sussex county increased slightly over 1959. Bank-run sand was produced by Lewes Sand Co. for use as engine sand. The Henry G. Graves & Sons, Inc., portable plant produced paving sand. The Atkins Bros. stationary plant near Millsboro produced washed sand as building material, unprepared sand for fill material, and unprepared gravel for miscellaneous uses. The entire output of sand and gravel from this county was transported to consumers by truck.

# The Mineral Industry of Florida

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Geological Survey of Florida.**

By Lawrence E. Shirley [1] and Robert O. Vernon [2]

FLORIDA produced a recordbreaking $177 million worth of mineral commodities in 1960. Production value increased 8 percent over 1959, the previous high year, and thus marked continuation of the trend of the past decade. Florida, the foremost producing State in the Nation for phosphate rock, fuller's earth, and staurolite, also led the Southeastern States in stone, peat, and oystershell output and was second only to Alabama in masonry and portland cement and lime, and second only to North Carolina in sand and gravel production. Production gains over 1959 were made in lime, peat, phosphate rock, sand and gravel, stone, titanium concentrates, magnesium compounds, staurolite, and zirconium concentrates.

Florida led the Nation in phosphate rock output for the 67th consecutive year and established a new high in the State; output increased 7 percent and value 16 percent over 1959. Leading phosphate rock producers were International Minerals & Chemical Corp., Virginia-Carolina Chemical Corp., and American Agricultural Chemical Co.

Stone output increased 3 percent and its value 4 percent over 1959 making it the second leading commodity in terms of value in the State; leading producers were Florida Rock Products Co., Camp Concrete Rock Co., and Ideal Crushed Stone Co.

**Employment and Injuries.**—Reports submitted to the Federal Bureau of Mines by producers in the mineral industries throughout the State indicated that 17 percent more mines, quarries, and mills were active than in 1959, an increase of 25 operations. The number of men working daily in these industries increased 3 percent, a net gain of 181 persons, over 1959. Total man-hours worked increased 1.4 million or 9 percent over 1959; there were increases in nonmetal mines and quarries and mills and decreases in metal mines and sand and gravel mines. Injuries per million man-hours decreased from 15 to 12. Fatal injuries decreased from 6 to 3 and nonfatal injuries from 240 to 223.

The University of Florida conducted its annual conference on Accident Prevention Engineering, as a public service to the employers and workers of Florida's industries. The conference, inaugurated in 1954, is held for 3 days each spring at the Florida Engineering and Industrial Experiment Station, Gainesville. Selected papers from

[1] Commodity-industry analyst, Bureau of Mines, Knoxville, Tenn.

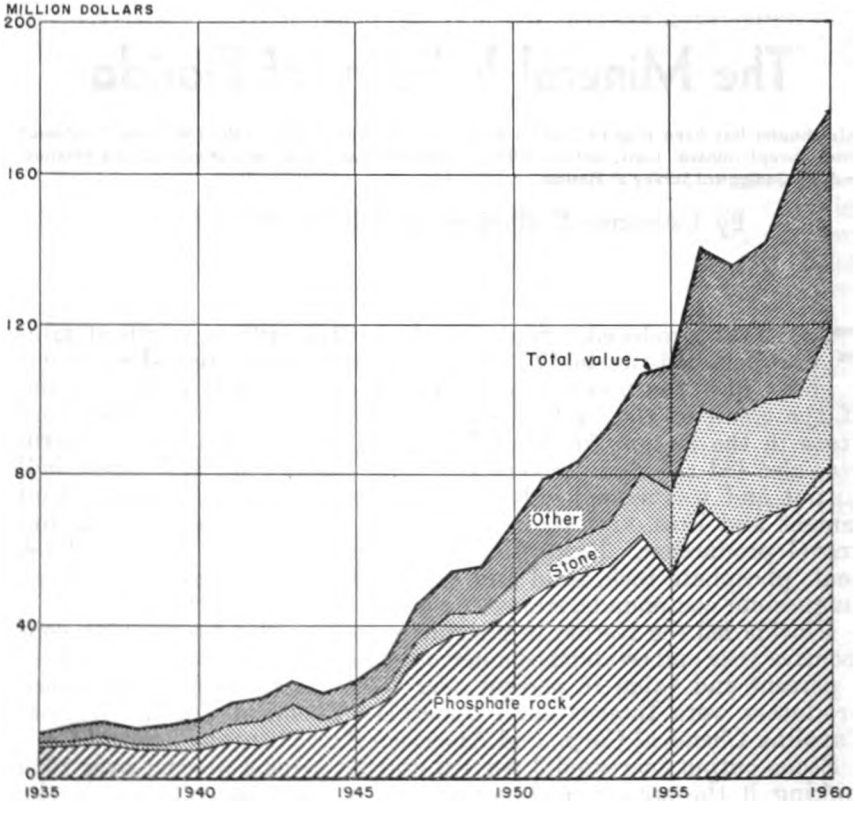

FIGURE 1.—Value of phosphate rock, stone, and total value of mineral production in Florida, 1935–60.

the conference were published,[8] and included such subjects as responsibilities of the safety engineer, industrial disaster planning and effective safety publicity.

**Consumption, Trade, and Markets.**—Florida's ports showed an 8-percent decline in exports and imports in 1960; the dollar volume of traffic fell from $729.8 million to $671.3 million. Exports dropped from $411.5 million to $318.3 million and imports from $379.3 million to $292 million. Port expansion and new construction highlighted port development during the year. Construction began on the new $20 million Port of Miami, implemented by the presentation by the city of Miami to the Metropolitan-Dade County Commission of property deeds for the 187-acre Dodge Island port site, the signing into law of a bill providing $3.8 million for Federal dredging on the new port, and the allocation of $2 million by the Metro Commission for initial construction. The port will offer facilities to attract shippers, using ultra-modern methods and ships designed to increase speed of ma-

terial handling. At the Port of Pensacola, a leading port for shipments of bulk fertilizer and paper, work was started on a $3.5 million project to develop a modern dock complex by bulkheading and extending present facilities; the new development, which includes new transit warehousing facilities, was expected to be completed in 2 years. At Port Everglades, near Ft. Lauderdale, work was nearly completed on major harbor improvements that included 1,475 linear feet of bulkheading for two new ship berths, with a water depth of 36 feet, and new maintenance buildings and berths for tugs.

The Atlantic Coast Line Railroad, which began piggyback service in June 1959, began scheduled piggyback train service between Florida and New York near the end of 1960. The special train, carrying truck trailers on specially constructed railway cars, will cut a day from the normal freight schedule between Lakeland, Fla., and New York City. Coast Line operated piggyback service on regular freight trains between 125 cities and carried more than 1,200 piggyback cars a month.

The volume of cement imported into Florida was of growing concern to domestic producers. Imports, which began in 1950, had increased steadily in the Florida customs district because of low freight rates, import duties, and price concessions.

Gypsum, perlite, and vermiculite were brought in from other States and processed for consumption in Florida and nearby States. National Gypsum Co. began constructing a new $6 million gypsum products plant near Port Tampa. Kaiser Gypsum Co. announced that a $3 million gypsum products plant would be built near Jacksonville.

Increased production of crushed stone and sand and gravel indicated expanding consumption of these commodities for road construction, concrete materials, and other building uses.

New developments during the year indicated increased consumption of phosphate rock in the immediate future for manufacturing ordinary superphosphate and triple superphosphate, for direct application to the soil, and for other fertilizer uses. Exports of phosphate rock increased 18 percent over 1959.

**Trends and Developments.**—Florida's industrial expansion and continued population growth contributed most to new developments during the year. Industry announced 839 new plants and major expansions during the year, the highest total reported since 1957, and 7 percent more than in 1959. Florida had been the third fastest growing State in the Nation since 1900, outpaced only by Arizona and California. Florida's population increase was 836 percent, from 529,000 in 1900 to 4,952,000 in 1960. The total population was expected to exceed 7 million by 1970. Brevard and Broward Counties occupied first and third places, respectively, out of 45 counties in the United States that more than doubled their population from 1950 to 1960. Florida's rate of gain in personal income last year was slightly ahead of the national average and continued to lead the South. The State ranked second in the Nation in terms of value of shipments of nonmetallic minerals, exceeded only by California.

Demand for electricity in Florida continued to increase, and new construction and expansion of power facilities continued by the State's four major power companies and municipally owned plants. Florida Power and Light Co. began an expansion program at its Riveria Beach plant to raise capacity from 140,000 to 440,000 kilowatts; and scheduled a second new unit for 1963 to add still another 300,000 kilowatts, making it the largest powerplant in the State. Tampa Electric Co. was adding 175,000 kilowatts of new capacity, Gulf Power Co. 150,000 kilowatts, and Florida Power Corp. 195,000 kilowatts. Among the municipally owned power systems, Jacksonville voted bonds to finance a 138,000-kilowatt addition and Orlando

Digitized by Google

was adding 90,000 kilowatts. Electric power generating capacity in Florida totaled 3.8 million kilowatts.

Houston Texas Gas and Oil Corp., a division of the Houston Corp., was authorized by the Federal Power Commission to build 235 miles of sales laterals in the State and to boost compressor capacity by 30,000 horsepower, at a cost of $16 million.

The Florida Development Commission announced that several sites in the northwestern part of the State were being considered for a nuclear fuel reprocessing plant that would cost between $12 and $20 million. The plant would treat fuel elements from privately owned nuclear powerplants and would require 6,000 acres of land.

Roadbuilding and bridge construction were accelerated. The interstate highway construction program in Florida ranked first in the Nation in utilization of interstate funds; of $194 million allocated to the State, all except $2.5 million had been obligated. Of Florida's total interstate mileage, 113 miles will be urban and the remainder rural. The urban mileage, 10 percent of the total, is expected to carry 50 percent of the traffic. At the end of 1960, 50.6 miles of interstate highway were open to traffic, 170.7 miles were under construction, and 183.1 miles were in the final planning state. The Florida Development Commission sold revenue bond issues totaling $47.2 million for road construction in 11 counties and authorized the financing of $26.8 million for 5 other projects in 5 counties. Output of crushed limestone, sand and gravel, and other roadbuilding materials increased for the year, and there were indications that demand would continue to increase.

Pan-American Sulphur Co. began constructing a 20,000-ton molten-sulfur storage tank in Tampa. The tank, expected to be completed in early 1961, will receive molten sulfur from Mexico in a Pan American tanker under construction in Germany. Tampa is Pan American's main U.S. shipping point and remelting facility. Freeport Sulphur Co. is also constructing a new 30,000-ton transshipment center at Tampa.

**Legislation and Government Programs.**—The Bureau of Sanitary Engineering, Florida State Board of Health, began a study to determine the air pollution problem. The results of the survey would guide establishment of appropriate air pollution control measures. Several of the phosphate producing companies installed new equipment or improved existing equipment to control both liquid and gas wastes from their operations.

The U.S. Department of the Interior, Office of Saline Water, awarded a contract to the Blaw-Knox Co. of Pittsburgh to erect and operate, at St. Petersburg, a freezing process pilot plant for converting salt water to fresh water. The plant will test a process developed under an Office of Saline Water contract by Cornell University. In addition, three solar-distillation pilot plants were under test at Daytona Beach.

The Bureau of Mines, at its Norris (Tenn.) Metallurgy Research Center, continued tests on Florida clay samples as part of its cooperative agreement with the Florida Geological Survey.

Digitized by Google

# REVIEW BY MINERAL COMMODITIES

## NONMETALS

**Cement.**—Cement output declined for the first time since 1957; output for all types of cement decreased 8 percent in quantity and 7 percent in value from 1959. Portland cement decreased 7 percent in quantity and 6 percent in value; masonry cement decreased 19 percent in quantity and 18 percent in value. The decreased production was attributed to delays in highway and general construction programs. Competition from foreign cement also had some bearing on the downturn: during 1960 about 896,000 barrels of cement was imported into the Florida customs district, more than into any other district in the Nation. Mineral commodities used in cement production, crushed limestone and clay, also decreased in output.

Lehigh Portland Cement Co. operated plants near Bunnell (Flagler County) and Miami (Broward County). Two descriptive articles on the electrical system employed in Lehigh's Miami plant were published.[4]

General Portland Cement Co. operated its Tampa and Miami plants throughout the year. The company continued its improvement and expansion program at both plants at an estimated cost of $11 million for 1960; projected expenditures for 1961 were $7 million. Construction at the Tampa plant, expected to be completed in 1961, would boost output to 7 million barrels annually. Features of this expansion were a 16½- by 600-foot kiln, said to be the largest wet-process unit in the United States, and four 12- by 36-foot compartment mills with 3,000-horsepower motors, also of record size. Hurricane Donna caused a temporary shutdown of the company's plants and interfered with construction projects and cement shipments.

Universal Atlas Cement Division of United States Steel Corp., secured options on three sites for cement distributing stations along the eastern seaboard, two of which were in Florida—at Jacksonville and Port Canaveral.

Prestressed-concrete railroad ties were tested on a one-fourth-mile section of track of Seaboard Air Line Railroad near Tampa by American Concrete Crosstie Corp. The ties, designed by the Association of American Railroads, were said to have competitive advantages over the conventional wooden ties; because of their strength, about one-third as many ties are needed per mile of track, and they are expected to last two or three times longer than wooden ties.

The volume of imported cement along the eastern seaboard, particularly in the Florida customs district, was of growing concern to domestic producers. In 1959, imported cement began to come into Florida in large quantities because it was badly needed, was of good quality, and supplied the needs of a fast-growing market that could not get its cement needs from domestic producers. When domestic cement was no longer in short supply foreign producers were able to continue to make inroads into the domestic market by offering

[4] Hower, John F., and Lendt, Arthur C., Lehigh's Miami Plant Highlights Advanced Thinking: Rock Products, vol. 63, No. 5, May 1960, pp. 168, 170, 172, 174; Lehigh's Power Quarters Set New Trend: Rock Products, vol. 63, No. 6, June 1960, pp. 114, 116, 119, 124.

Digitized by Google

price concessions because of low freight rates and low import duties. Domestic producers made no great effort to counteract these imports by greater exports, partly because most other countries had prohibitively high import duties. Articles were published during the year concerning cement imports.[5]

Ponce Products, Inc., Ponce, Puerto Rico, purchased a further interest in Maule Industries, Inc., a large producer of ready-mixed concrete, concrete products, and crushed limestone and other aggregates in the Miami area. Funds from the purchase were to be used by Maule Industries to build new aggregate and ready-mix plants west of Miami. Ponce owns two cement plants in Puerto Rico which ship much of their output to Florida's east coast.

**Clays.**—Total clay production, including fuller's earth, kaolin, and miscellaneous clay, decreased 2 percent in output but increased 2 percent in value over 1959. Florida, for the third consecutive year, ranked first in the Nation in production of fuller's earth and output reached a new record high. Tonnage and value increased 3 percent over 1959, totalling 252,000 tons valued at $6.4 million. Fuller's earth accounted for about 4 percent of the total mineral production value of Florida. Fuller's earth was mined in Gadsden County by Minerals & Chemicals Phillip Corp., Floridin Co., Inc., and Magnet Cove Barium Co.

On July 21, Minerals & Chemical Corp. of America and the Phillip companies, consisting of Phillip Brothers, Inc., and Phillip Brothers Ore Corp. merged to form Minerals & Chemicals Phillips Corp. Phillip Brothers, Inc., and its subsidiary are importers, exporters, processors, and merchants in ferrous and nonferrous ores, metals, and minerals. They operate in the United States and through subsidiaries abroad. Minerals & Chemicals, in addition to its fuller's earth operations in Florida, produces and processes kaolin, bauxite, and limestone products, with mines and plants in Georgia, Arkansas, Michigian, Ohio, and Virginia and a research center at Menlo Park, N. J.

The Floridin Co., with facilities in both Tallahassee and Quincy, celebrated its 50th anniversary by beginning research into new applications for fuller's earth; the company also opened new sales offices in New York, N. Y., St. Louis, Mo., and Dallas, Tex., in an effort to reach new markets for fuller's earth, activated bauxite, and chromatographic adsorbents.

Kaolin output decreased by 2 percent and its value by 7 percent from 1959. Putnam County was the only county in which kaolin was produced; it was mined by United Clay Mines Corp. and Edgar Plastic Kaolin Co. A deposit containing 16 million tons of kaolin was located between Leesburg and Okahumpka in the Lake County area. The material was suitable for chinaware or pottery.

Miscellaneous clay production decreased 5 percent in both quantity and value from 1959, due to an 11-percent decrease in clay used for cement manufacture. The clay was mined in Citrus County by General Portland Cement Co., in Clay County by the Solite Corp., and in Gadsden County by the Apalachee Correctional Institute.

Universal Sewer Pipe Corp., announced plans to construct a 200,000-square-foot plant near Ocala, to produce vitrified clay pipe and related

[5] Bell, Joseph N., Cement Imports Pose Threat: Rock Products, vol. 63, No. 10, October 1960, pp. 81–93. Price, Frederick C., Cement Outlook: Grim but Hopeful, Chem. Eng., vol. 67, No. 22, Oct. 31, 1960, pp. 60, 62, 64.

Digitized by Google

products; operations at the company's concrete pipe facility near the main plant on Neville Island near Pittsburgh, Pa., were being discontinued. Vulcan Materials Co., with concrete pipe plants in Jacksonville and Tampa, constructed a modern concrete pipe plant at Orlando, Fla. to replace obsolete facilities at Sanford. A new concrete pipe plant also was built by the company at Tallahassee and existing facilities there were expanded at a cost of $250,000. Plans were also announced for a new plant at Apopka. Southern Lightweight Aggregates Corp. of Richmond, Va., changed its name to Solite Corp. The company, in its second year, produced lightweight aggregate at Green Cove Springs for use in structural concrete and masonry. The company also maintained offices in Jacksonville. A description of the Solite operation was published.[6]

**Gem Stones.**—Gem stone output, valued at $3,000 in 1959, declined to less than $1,000. Production of agatized coral from the Tampa Bay area in Hillsborough County was reported. No collecting of selenite or shells was reported, although a certain amount of this type of collection goes on the year round.

**Gypsum.**—United States Gypsum Co. at Jacksonville, Duval County, calcined gypsum for use in manufacturing building products. The company completed a new plant to produce paper used in the manufacture of sheetrock, wallboard and other products manufactured in the company's plant at Jacksonville.

National Gypsum Co., started constructing a gypsum products plant estimated to cost $6 million, on a 30-acre site on Tampa Bay. The plant will process gypsum ore received by ship from National Gypsum's deposits in Nova Scotia, and manufacture gypsum wallboard, lath, sheathing, and plaster. The new plant was expected to be in production in mid-1962. In 1960, the company was supplying the growing Florida market from its recently expanded plant in Savannah, Ga.

Kaiser Gypsum Co., of Oakland, Calif., a wholly owned subsidiary of Permanente Cement Co., exercised its option to purchase 34 acres of property near Jacksonville, as a site for a $3 million gypsum products plant to be completed in 1961. Kaiser Aluminum & Chemical Corp. manufactured sodium silicate at Mulberry.

**Lime.**—Lime was produced in four counties by four companies; three of the operations were captive. Output of lime continued an upward trend, increasing 36 percent in quantity and 111 percent in value over 1959. Dixie Lime Products Co. (Ocala No. 1 limekiln), Marion County, the only commercial lime producer in the State, sold quicklime and hydrated lime for masonry, chemical, and industrial uses. Buckeye Cellulose Corp. (Foley limekiln), Taylor County, the largest producer of lime in the State, produced 97,000 tons of quicklime for use in its own plant for water purification and causticizing. The company announced about midyear a program for increasing capacity for bleached kraft and dissolving pulps by 33,000 tons per year—3 percent higher than the current capacity of 260,000 tons per year. This would be the company's third expansion in 3 years. In 1959, a $20-million expansion was completed when a second produc-

[6] Wright, C. E., Solite Didn't Spare the Spadework: Rock Products, vol. 63, No. 4, April 1960, pp. 144, 146.

Digitized by Google

tion line was added. It was anticipated that lime requirements would expand further as water purification needs increase. Michigan Chemical Corp. (Port St. Joe limekiln), Gulf County, produced quicklime for its own use. The city of Miami (Hialeah limekiln), Dade County, produced 23,000 tons of quicklime valued at $244,000 for municipal water purification and softening.

Chemical Lime, Inc., Brooksville, announced in September that a plant costing $2 million would be constructed to produce quicklime and hydrated lime for the chemical processing and other industries. The plant was to go on stream in the summer of 1961 with a design capacity of 200 tons per day. Raw material—Ocala limestone—will be obtained from the quarry of Camp Concrete Corp.

**Magnesia.**—Michigan Chemical Corp., in its second year of production of magnesia from sea water, increased output considerably. The company produced refractory and caustic-calcined magnesias for use by the plastic, refractories, fertilizer, chemical, paper, glass, rubber, insulation, and petroleum industries. During the year the company installed new equipment, including a special rotary kiln.

**Perlite.**—Crude perlite from Western States was processed by three companies in three counties; combined output was 9,000 tons valued at $599,000 compared with 11,000 tons valued at $786,000 in 1959, a decrease of 18 percent in tonnage and 24 percent in value. This was the first year that a decrease had been recorded since production began in 1952. Average value-per-ton of the processed material increased to $69.23 per ton from $69.09 in 1959. Airlite Processing Corp. of Florida, Indian River County, the largest producer in the State, expanded perlite for use in building plaster and concrete aggregate; Tennessee Products & Chemical Corp., Duval County, expanded perlite for use in building plaster at its Jacksonville plant; and Perlite, Inc., Dade County, expanded perlite at its Hialeah plant for use in building plaster, concrete aggregate, and soil conditioning.

**Phosphate Rock.**—For the 67th consecutive year, Florida led the Nation in total phosphate rock production. Seventy percent of the Nation's marketable phosphate rock was produced in Florida. Tonnage and value both reached record highs in 1960. Combined marketable production of all types of phosphate rock totaled 12.3 million tons valued at $82.5 million, an increase of 7 percent in quantity and 16 percent in value over 1959. Land-pebble phosphate which comprised 99 percent of the total phosphate rock output, established a new record for marketable production and was responsible for the total gain. Hard-rock and soft-rock phosphate both declined in output and value from 1959. The largest decline was in soft rock which decreased 10 percent in tonnage and 7 percent in value; hard-rock output decreased 1 percent in tonnage, but increased 1 percent in value from 1959.

Mine production of land-pebble crude ore, dry basis, was 47,651,000 long tons, with a $P_2O_5$ content of 4,980,000 long tons. A total of 12,132,000 long tons of processed materials with a $P_2O_5$ content of 3,984,000 long tons was sold or used during 1960. Land pebble for agricultural purposes comprised 54 percent of that sold or used and totaled 6,562,000 long tons; 63 percent went into ordinary superphosphate, 24 percent into triple superphosphate, and the remaining 13

Digitized by Google

percent was used for direct application to the soil, other fertilizer uses, and stock and poultry feed. Industrial purposes consumed 20 percent or 2,427,000 tons; 87 percent of this tonnage was used for making phosphoric acid by the wet process and the remaining 13 percent went into the manufacture of elemental phosphorus. Twenty-six percent or 3,143,000 long tons of the total was exported, an increase of 18 percent over 1959. A total tonnage of 1,137,000 long tons of processed material was sold to and purchased from mining companies, an interchange common to the industry.

Land-pebble phosphate came from 14 mines operated by 8 companies in Polk and Hillsborough Counties. In Polk County, the following companies, listed in order of output, operated: International Minerals & Chemical Corp. (Achan and Noralyn mines), Virginia-Carolina Chemical Corp. (Clear Springs and Homine mines), American Agricultural Chemical Co. (South Pierce mine), American Cyanamid Co. (Orange Park mine), Swift & Co. (Varn and Watson mines), W. R. Grace & Co., Davison Chemical Division (Bonny Lake and Clark-James mines), Armour Agricultural Chemical Co. (Armour mine), and Smith-Douglass Co., Inc. (Tenoroc mine). In Hillsborough County, American Cyanamid Co. (Sydney mine) and American Agricultural Chemical Co. (Boyette mine) operated.

Hard-rock phosphate, for use in manufacturing phosphorus and ordinary superphosphates, was produced by only one company, Kibler-Camp Phosphate Enterprise (Section 20 mine), Citrus County.

Soft-rock phosphate production came from seven mines operated by six companies in three counties. The largest single mine producer was Sun Phosphate Co. (Dunnellon mine), Citrus County; the largest producing company, with two mines, was Loncala Phosphate Co. (Mona mine in Gilchrist County, and Lake City Junction mine in Columbia County). Other producers, in order of output, were Soil Builders, Inc. (Mincoll mine), Kellogg Co. (Kellogg mine), Camp Phosphate Co. (Hernando mine), and Superior Phosphate Co., all of Citrus County. Total marketable production was 46,488 long tons

**TABLE 3.—Phosphate rock sold or used by producers, by uses**

| Use | 1959 | | | 1960 | | |
|---|---|---|---|---|---|---|
| | Long tons | Value | | Long tons | Value | |
| | | Total | Average per ton | | Total | Average per ton |
| Ordinary superphosphate | 4,293,954 | $26,891,017 | $6.26 | 4,155,626 | $28,402,633 | $6.83 |
| Phosphoric acid (wet process) | (1) | (1) | (1) | 2,100,706 | 13,094,121 | 6.23 |
| Triple superphosphate | [2] 3,459,413 | [2] 20,220,090 | 5.84 | 1,571,823 | 10,883,760 | 6.92 |

**TABLE 4.—Marketable production of phosphate rock**

(Thousand long tons and thousand dollars)

| Year | Hard rock | | Soft rock | | Land pebble | | Total | |
|---|---|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951-55 (average) | 81 | $637 | 83 | $496 | 9,028 | $54,371 | 9,192 | $55,504 |
| 1956 | 96 | 809 | 59 | 378 | 11,668 | 73,103 | 11,823 | 74,290 |
| 1957 | 80 | 689 | 52 | 365 | 10,059 | 63,736 | 10,191 | 64,789 |
| 1958 | 87 | 737 | 53 | 414 | 10,711 | 67,800 | 10,851 | 68,951 |
| 1959 | 78 | 666 | 52 | 414 | 11,434 | 70,128 | 11,564 | 71,208 |
| 1960 | 77 | 670 | 47 | 384 | 12,197 | 81,476 | 12,321 | 82,530 |

valued at $384,536, a decrease of 10 percent in quantity and 7 percent in value from 1959. The phosphate was all used in stock and poultry feed and for direct application to the soil.

International Minerals & Chemical Corp., Bartow, the largest producer of phosphate rock in the State, increased output 11 percent in quantity and 21 percent in value over 1959, a record year despite damage and flooding by Hurricane Donna, a break in the impounding dam of the Noralyn mine, and labor strikes. The company signed a multi-million-dollar contract with Electric Reduction Co., Toronto, Ont., to supply calcined phosphate rock from its Noralyn mine to Port Maitland, Ont., where Electric Reduction was building a $12-million plant to produce phosphoric acid, dicalcium phosphate, triple superphosphate, and sodium tripolyphosphate. International will serve as U.S. sales agent. In the last quarter of 1960, International announced plans to build a new $1 million phosphate-calcining plant at Noralyn, adjacent to an existing plant, to handle the increased demand resulting from the Electric Reduction contract. The company placed in operation a recirculating system at its Bonnie plant designed to control both liquid and gas wastes in chemical processing of phosphates.

Virginia-Carolina Chemical Corp., Bartow, second largest producer of phosphate, increased output of marketable phosphate 49 percent in quantity and 57 percent in value over 1959, a record high. During 1960 the company tripled superphosphate capacity at its Nichols plant from 100,000 to 300,000 tons per year as part of a $10 million expansion program; completed a new diammonium phosphate plant, with potential capacity of 100,000 tons per year, adjacent to the company's concentrated superphosphate facility at Nichols; and completed a new phosphate-rock flotation plant costing more than $1 million, at the Clear Springs mine, 20 miles south of Nichols. The company sold its one-third interests in Gulfcoast Transit Co. and Mid-South Towing Co., phosphate and coal haulage companies, to Peabody Coal Co. and Tampa Electric Co., former partners in the operations. A labor dispute resulting from a company proposal to divide mining and processing into two contract units, begun in 1959, extended into 1960.

American Agricultural Chemical Co., the third largest producer of marketable phosphate, decreased output 8 percent in quantity and 4 percent in value under 1959, the first decrease by the company since 1955. The company began constructing a new phosphate washer at

Digitized by Google

Palmetto with completion scheduled for March 1961. A hydrosizer for the new plant was developed by the company's metallurgical staff. The company's new air classifiers at its Pierce plant were described.[7]

American Cyanamid Co., Brewster, the fourth largest producer of land-pebble marketable phosphate, increased output 27 percent in quantity and 45 percent in value over 1959, establishing a record year for output at its Orange Park mine. The company's phosphoric acid plant at Brewster was expanded to 200,000 tons (54 percent acid) per year; additional construction was begun at the same location to provide for a total of 400,000 tons of 54 percent phosphoric acid capacity annually. Approximately 3,500 acres of phosphate rock-bearing land in the Brewster area were purchased during 1960, in line with the company's long-range program of reserve acquisition. Planned expansion of the company's triple superphosphate facilities called for the installation of additional rock-grinding equipment, new granulation facilities, and a new quality-control laboratory at Brewster, enabling entry into the direct application market, both in the United States and abroad. The company announced plans at the end of 1960 to increase expenditures for pollution control by $2 million. A large chain mill and scrubber installation, to reduce fluorine emission from the firm's triple superphosphate curing building, was completed at a cost of $500,000 and was expected to reduce fluoride emitted to the atmosphere by about 70 percent. The company's pollution control system was described.[8]

Swift & Co., Bartow, began to double phosphoric acid capacity in the last half of 1960, to increase output of triple superphosphate. The company signed a 3-year labor contract with the International Chemical Workers Union that called for wage increases extending into 1961.

W. R. Grace & Co., Davison Chemical Division closed its Pauway No. 4 mine near Lakeland and opened the new Clark-James mine; extensive modernization and expansion of mining facilities was in progress at the close of the year. The company completed its new 400-ton-per-day sulfuric acid plant at Bartow; expansion of phosphoric acid facilities was also in progress at yearend. A wet scrubber to remove dust ejected into the air by drying plants was installed by the company at its Ridgewood plant. The new scrubber used 15 gallons of water per minute and handled 145,000 cubic feet of exhaust gas per minute. It was the first of its type to be installed in the Florida phosphate field.

Armour Agricultural Chemical Co., Fort Meade, announced that construction of a new phosphate facility to produce phosphoric acid, triple superphosphate, and sulfuric acid, estimated to cost $10 million, would begin in 1961. The new plant was part of a $60 million company expansion program set for completion in 1962.

Smith-Douglass Co., Inc., perfected a new phosphate-ore flotation process that demonstrated 30 percent savings in major equipment costs and 20 percent in operating costs, based on an 8-month test. In the new process, silica is floated first instead of phosphate. The key to the new process is an air-operated cell with no moving parts. Ground

[7] Engineering and Mining Journal. New Air Classifiers Reclaim Phosphate: Vol. 161, No. 10, October 1960, pp. 105-106.
[8] Pit and Quarry. Fluoride Pollution Control System Installed at American Cyanamid Plant: Vol. 53, No. 3, September 1960, p. 115.

Digitized by Google

phosphate rock, mixed with a chemical, enters the feed distribution box at the top of the cell and water is forced through pinholes in rubber tubes on three levels of the cell. Combined action of the water, the air bubbles, and the shape of the cell itself circulates the mineral suspension. About 10 percent more phosphate is recovered from the ore than in conventional cells, where an impeller usually stirs the suspension. Flotation starts as an amine reagent coats the silica lumps, usually about one thirty-second of an inch in diameter. Since the amine has an affinity for air bubbles, buoyant bubbles of encased silica form and float to the surface where they overflow the cell. Phosphate sinks to the bottom and is discharged through the underflow. A detailed description of the process was published.[9] Near the end of 1960, the company doubled the input rate of its flotation pilot plant at the Tenoroc mine, east of Lakeland to 100 tons per hour of phosphate rock. The pilot plant, using the Hollingsworth-Sapp system, was originally built with commercial-size equipment, and the final step in the company's expansion program will be a complete changeover to the new process. During pilot plant testing, phosphate recoveries were 95 percent; 85 percent is normal in other processes. According to the company, this increase could mean a saving of $8 million per year for Florida producers.

U.S. Phosphoric Products division, Tennessee Corp., Tampa, announced a multi-million-dollar expansion for its operations at Gibsonton. The new facilities will increase output of phosphate products 50 percent. An $11 million ammonia plant also was under construction. The new phosphate facilities were expected to be completed by late 1961 or early 1962.

National Phosphate Co., Marseilles, Ill., reported that construction of a new phosphoric acid plant was 50 percent complete; National will use Florida phosphate rock and sulfuric acid to produce phosphoric acid (54 percent) by the wet-process method.

Plymouth Cordage Co., of Plymouth, Mass., acquired Wilson & Toomer Fertilizer Co., of Jacksonville for $8.5 million; Wilson & Toomer makes fertilizers, pesticides, and poultry byproducts. Plymouth Cordage had four plants in Florida and two in Georgia; it also had rock-crushing, stevedoring, and warehousing operations in Florida.

The Tennessee Valley Authority (TVA)[10] continued prospecting in the Florida hard-rock phosphate area. TVA purchased 600 acres of phosphate land, to increase total holdings to 4,074 acres. At the 1960 rate of consumption this represented an ore reserve of about 19 years. No mining was done by TVA in Florida. TVA studies to develop more efficient methods of recovering phosphate from the Florida hard-rock field were continued, wet-screening method now in use commercially recover only about half the phosphate. High-analysis Florida land-pebble phosphate was purchased for the research and mixed with Tennessee phosphate matrix to make a suitable charge for the electric furnaces or treated with phosphoric acid or $P_2O_5$ to make a high-analysis fertilizer. Improvements were made in the demonstration

[9] Chemical Week, Flotation Switch Cuts Phosphate Costs: Vol. 87, No. 3, Sept. 24, 1960, pp. 75–76.

[10] Tennessee Valley Authority, Annual Report of the Tennessee Valley Authority, for fiscal year ended June 30, 1960, 83 pp.

Digitized by Google

plant placed in operation in 1959 for experimental production of nitric phosphate-type fertilizer from leach-zone ore. This ore is primarily an aluminum phosphate and is discarded with overburden in Florida phosphate mining operations. Plant improvements in 1960 increased output; 1,267 tons was produced. TVA made a total of 264,000 tons of fertilizer of all types, sold 250,000, and used the remainder in farm demonstration programs. During 1960 a new process was developed by TVA to make granular diammonium phosphate fertilizer. It was reported that the method can use low-cost wet-process phosphoric acid without a purification step. A more detailed description of the product was published.[11]

**Sand and Gravel.**—A new record was established in combined production of sand and gravel. Total output sold or used by producers was 6.8 million tons valued at $5.6 million, an increase of 1 percent in quantity and 7 percent in value over 1959. Individually, sand production increased 1 percent in tonnage and 8 percent in value; gravel decreased 2 percent in tonnage and increased 5 percent in value. Sand and gravel was produced by 43 mines in 12 counties, 2 counties less than in 1959. Leading sand and gravel producing counties, as in 1959, were Polk, Putnam, and Lake, listed in order of output. Leading producers of sand, all in Polk County, were Mammoth Sand Co. (Lake Wales mine), Pembroke, Standard Sand Co. (Standard mine), Davenport, and Oak Ridge Sand Co. (Achan mine), Mulberry. Eighty percent of the sand produced was sold or used as building sand, 9 percent as fill sand, 6 percent as paving sand, and the remaining 5 percent as glass, molding, blast, and filter sand and for other uses. Gravel, produced by 7 mines in 6 counties, decreased 2 percent in quantity from 1959. Sixty-one percent was used or sold as building gravel and 39 percent as paving gravel. Leading gravel producers were Florida Gravel Co. (Chattahoochee mine), Chattahoochee; Ward Gravel Co. (Century mine), Flomaton, Ala.; and Dade-Broward Rock Co. (Opa Locka mine), Opa Locka. Ninety-five percent of the sand and gravel was processed by washing, classifying, sorting, or other methods and the remaining 5 percent was unprocessed material. Fifty-eight percent of the sand and gravel was transported by railroad, and 42 percent by truck.

Southern Materials Co., Jacksonville, established a new sand operation in Putnam County, and spent $3.4 million for diversification and expansion. Seven ready-mixed concrete plants, a concrete block plant, and the sand operation were added in the Jacksonville area. The Florida Division of Oakland Consolidated Corp. of Michigan started construction on a new sand plant 2 miles west of Clermont, Lake County. The new plant, to be operated by Oakland Sand and Minerals Corp., was expected to be operating in the first half of 1961. The plant will have a capacity of 7,500 tons per day. A major feature of the plant will be a 100-foot-high tower for gravity stockpiling of more than 75,000 tons of finished sands. Ferro Corp., Cleveland, Ohio, a large producer of porcelain enamel frit, announced plans to build a new fiber glass plant at North Miami, Dade County, as part of Ferro Corp's. $2.8 million expansion program. Products of the

[2] Includes glass, molding, blast, filtration, and other sands.

plant will be glass mats and colored coatings for the Florida glass boat industry. Benner Glass Co., Jacksonville, announced expansion of its glassware plant; the 6-year-old company had increased employment from 12 to 175 workers, and distributed its products throughout the eastern half of the United States.

Precast and prestressed concrete bridge sections were used in constructing the 3-mile Pensacola Bay Bridge. Monolithic deck units spanned 60 feet and weighed 156 tons; some of the prestressed cylinder piles were 164 feet long, believed to be the longest of their type used in U.S. bridge construction.

**Staurolite.**—Staurolite output reached a new high with an increase of 5 percent in tonnage and 8 percent in value over 1959, the previous record year. E. I. du Pont de Nemours & Co., Inc., Clay County, the

Digitized by Google

only producer in the United States recovered staurolite as one of the byproducts in concentrating titanium minerals at its Highland and Trail Ridge plants. Staurolite was sold as a source of alumina and iron oxide for the manufacture of cement.

**Stone.**—Florida led the Southeastern States in total stone production with an output of 27.6 million tons valued at $37.4 million, increases of 3 percent in tonnage and 4 percent in value over 1959, the previous record year. Total stone production had increased each year since 1952, attesting to the rapid growth of construction in Florida. Crushed limestone, the principal stone commodity, also established a new high in 1960; output was 26 million tons valued at $34.9 million, an increase of 4 percent in quantity and 5 percent in value over 1959, the previous record year. Crushed limestone accounted for 94 percent of total stone production. Crushed limestone used in cement manufacture decreased 13 percent in tonnage and 8 percent in value below 1959, due to decreased raw-material requirements by the cement industry. Crushed oystershell production, which had been growing since 1955, decreased 16 percent in tonnage and 10 percent in value under 1959; total output was 1.6 million tons valued at $2.6 million. It was used for concrete and roadstone (97 percent) and poultry grit (3 percent). For the first time since 1951, no dimension limestone was recorded. Marl was produced for the first year since 1949, by Seminole Shell Products Co., Inc. (Dunedin quarry), Pinellas County, for use as a filler.

Crushed limestone was produced at 75 mines in 20 counties; 84 percent was used for concrete, roadstone, and screenings, and the remainder for agricultural railroad ballast, and other uses; 9 companies in 7 counties produced crushed limestone for agricultural purposes.

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other."
[2] Includes cement, asphalt filler, poultry grit, lime, other uses, and uses indicated by footnote 1.

Leading counties in crushed limestone output were Dade, Hernando, and Broward; Broward was the second leading county in 1959. Leading State producers in order of output were Florida Rock Products Co. and Camp Concrete Rock, both of Hernando County, and Ideal Crushed Stone Co., Dade County.

Noncommercial crushed limestone was produced by six county highway departments in 1960, compared with only one of record in 1959; 395,000 tons of limestone valued at $308,000, all used for concrete, roadstone, and screenings, was produced. The leading noncommercial producer was Palm Beach County Highway Department. Crushed limestone was transported 63 percent by truck, 35 percent by railroad, and 2 percent by water. All noncommercial limestone was transported by truck.

Crushed oystershell was produced by seven companies in six counties at eight locations, mostly on leases obtained from the State of Florida. Decreases in output for the year were attributed to inclement weather and fluctuations in roadbuilding. Leading oystershell producers were, in order of output, Bay Dredging and Construction Co., Hillsborough County; Benton and Co., Pinellas County; and Bay Towing and Dredging Co., Walton County. Oystershell was transported 51 percent by truck, 47 percent by water, and 2 percent by railroad.

New limestone producers reporting for the year included the following: W. & M. Construction Co., Inc. (Norfleet quarry), Alachua County; Crystal River Quarries, Inc. (Crystal River quarry), and Colitz Mining Co. (Blue Water quarry) both in Citrus County; A. J. Capeletti, Inc. (Pennonco quarry), Joe Daniel, Inc., Division of A. J. Capeletti, Inc. (Joe quarry), Harry C. Delaney, Inc. (Peterson quarry), all of Dade County; Limestone Products, Inc. (Columbia City quarry), Columbia County; Williston Shell Rock Co. (Chauncey quarry), Lafayette County; Peacock Lime Rock Co. (Wildwood quarry), Sumter County; R. H. Wright, Inc. (HDSSF quarry), Monroe County; and Port Richey Mining Corp. (Hudson quarry), Pasco County.

Articles were published concerning crushed stone operations owned or operated by the following: Three Bays Improvement Co. (Rock-

Digitized by Google

dale quarry) near Perrine;[12] Seminole Rock Products Co., Inc. (Medley quarry) near Miami;[13]. Quality Lime Products Co. (Sumterville quarry), Sumter County;[14] and R. H. Wright, Inc., Florida Unit of Houdaille Industries, Inc., of Buffalo, N.Y.[15]

**Vermiculite.**—Zonolite Co. exfoliated vermiculite in plants at Jacksonville, Duval County; Tampa, Hillsborough County; and Boca Raton, Palm Beach County. Plant output increased 19 percent in quantity and 18 percent in value over 1959. The raw material supplying the plants was mined in South Carolina, Montana, and the Union of South Africa. Verlite Co., Tampa, opened a modern vermiculite-exfoliating plant, utilizing South African material, in October.

Research on new uses for vermiculite continued throughout the year; the Vermiculite Institute and the Vermiculite Association, Inc., increased research budgets for 1961. Concrete blocks, slabs, planks, and other forms were improved by research with aerating and foaming additives and by adding latex to the mix.

## METALS

**Ferroalloys.**—American Agricultural Chemical Co., Pierce, and Virginia-Carolina Chemical Corp., Nichols, produced ferrophosphorus as a byproduct of the electric furnace process for smelting phosphate rock to make elemental phosphorus. Approximately 88 percent of the ferrophosphorus produced was shipped.

**Rare-Earth Metals.**—Titanium Alloy Manufacturing Division of National Lead Co., near Jacksonville, the only producer of monazite in Florida, recovered a small quantity of monazite as a byproduct in concentrating titanium minerals, but made no shipments during the year.

**Steel.**—Florida Steel Corp. of Tampa, and Easterby & Mumaw, Inc., Charlotte, N.C., merged during the year. Florida Steel operated four plants in Tampa including an electric furnace with a 51,000-ton ingot capacity per year, one plant in Miami, and one in Orlando. Easterby & Mumaw, with plants in Charlotte and Raleigh, N.C., was engaged in steel fabrication and warehousing.

Sovreign Resources, Inc., and John D. McArthur, Chicago, announced that a steel plant with a capacity of 75,000 to 90,000 tons of finished reinforcing bars and merchant shapes, would be constructed in the Miami trade area. The plant was expected to be in production in the first half of 1961.

Sa-Nu Steel Corp., Hialeah, placed in operation a small steel smelting plant employing about 10 persons.

Metal and Thermit Corp. began constructing a new $500,000 detinning plant, east of Tampa. The company, largest detinner in the world, will recover tin and steel from scrap obtained from both domestic and foreign sources.

**Titanium Concentrates.**—For the fifth consecutive year, Florida ranked second in the Nation in production of titanium concentrates.

[13] Pit and Quarry. Seminole Keeps Pace with Florida Boom: Vol. 53, No. 3, September 1960, pp. 142–145.

[14] Pit & Quarry. Quality Lime Solves Water Problem, Reopens Abandoned Quarry: Aug. 12, 1960, pp. 80–81.

[15] Dean, Stan. All Wright . . . All Ways: Business Wheels, vol. 9, No. 2, 1960, pp. 9–12.

Digitized by Google

Total output of concentrates, including ilmenite and rutile, was a record 286,000 tons valued at $7,489,000, increases of 9 percent in tonnage and 4 percent in value over 1959. Ilmenite output increased 9 percent in tonnage and 5 percent in value over 1959; rutile output increased 3 percent, and value remained about the same.

E. I. du Pont de Nemours & Co., Inc., produced ilmenite from the Highland mine near Lawtey, Clay County, and from the Trail Ridge mine near Starke, Bradford County. Du Pont was the principal producer of ilmenite.

Titanium Alloy Manufacturing Division of National Lead Co. (Skinner mine), Duval County, produced both ilmenite and rutile near South Jacksonville; the company was the largest producer of rutile.

Florida Minerals Co. (Vero mine), Indian River County, produced both ilmenite and rutile. Rutile Mining Co. of Florida (Jacksonville mine) did not produce any titanium concentrates during the year, but made shipments of rutile from stocks.

A Florida Supreme Court decision gave Coastal Petroleum Corp., a wholly owned subsidiary of Coastal Carribean Oils, Inc., rights to all minerals under the company's drilling leases, covering about 4.5 million acres. The decision upheld a prior action, early in the year, of the District Court of Appeals in Tallahassee which denied a State of Florida contention that State drilling leases excluded rights to metallic minerals. The position of Coastal Petroleum was that its leasehold interests gave it claim to all minerals, including not only oil, gas, and sulfur, but also metallic minerals such as ilmenite, rutile, and zircon.

**Zircon.**—Florida for the 21st consecutive year ranked first in the Nation in zircon production. Output was slightly under 1959, but value increased 6 percent. E. I. du Pont de Nemours & Co., Inc., the largest producer, recovered and sold zircon from its Trail Ridge and Highlands operations, for use in refractories and foundries. Titanium Alloy Manufacturing Division of National Lead Co. (Skinner mine), Duval County, recovered and sold zircon. Florida Minerals Co. (Vero mine), Indian River County, recovered zircon as a by-product of rutile and ilmenite mining.

Columbia-National Corp., the only producer of zirconium sponge in the Southeast, which had closed in December 1959, reopened its Pensacola plant to supply a contracted 700,000 pounds per year of zirconium sponge to AEC. The plant had been closed pending corrosion tests on the metal.

## MINERAL FUELS

**Natural Gas.**—Production of natural gas, all from Sunniland field, Collier County, decreased 12 percent from 1959. Houston Texas Gas & Oil Corp., a division of the Houston Corp., was authorized by the Federal Power Commission to spend $16 million to build 235 miles of sales laterals and to boost its compressor capacity by 30,000 horsepower. The company, which owned a transmission line from Baton Rouge, La., to Miami, planned to increase its maximum deliveries by 93 million cubic feet per day, and transport the gas into Florida for sale to 21 new customers for resale purposes, to 11 new consumers,

615629—61——19

Digitized by Google

and to 1 existing company at a new location. New companies to be supplied included two electric power companies, Florida Power Corp., St. Petersburg, and Florida Power and Light Co., Miami, and the U.S. Phosphoric Products Division of Tennessee Corp. for use as the raw material in a 350-ton-per-day ammonia plant under construction at Tampa.

**Peat.**—Florida ranked second in the Nation in peat production, moving up from third in 1959. Total output from seven producers in four counties was 39,000 tons valued at $162,000, an increase of 14 percent in tonnage and 3 percent in value over 1959. Putnam County was first in production, followed by Hillsborough, Orange, and Palm Beach, in order of output. Two types of peat, humus and reed-sedge, were produced chiefly for soil improvement.

**Petroleum.**—Preliminary crude petroleum production, from 11 wells, all in Sunniland field, Collier County, and all operated by Humble Oil & Refining Co., decreased from 424,000 barrels in 1959 to 368,000 barrels in 1960, a 13-percent decline. Cumulative production through 1959 totalled 6.5 million barrels.

The U.S. Supreme Court handed down a formal order setting the seaward boundary of Florida and providing the State with constitutional authority to control the leasing of submerged land seaward for 10.5 miles into the Gulf of Mexico. The Court ruled that Florida was entitled to a 3-marine-league belt under the gulf, as described in the State's 1868 constitution, and upheld Florida's contention that Congress approved such a 3-league boundary for Florida after its admission into the Union.

Coastal Production Co. was formed as a wholly owned subsidiary of the Houston Corp., St. Petersburg, for the purpose of participating in exploration and production along the route of natural gas lines operated by the company's subsidiaries, Coastal Transmission Co. and Houston Texas Gas & Oil Corp.

The 23 Federal leases, totaling 132,400 acres, in the Marquesas area off Florida failed to yield production. Exploration on the leases, acquired jointly by The California Co. and Gulf Oil Corp. in 1959, was conducted during 1960. A 15,294-foot test well, the Gulf-Calco No. 1 OCS, was plugged and abandoned in April. The company began drilling on tract OCS–44, using a floating vessel, and planned to do additional core drilling during 1961. Application for the first deep test off the west coast was made to the State, on State Lease 224–B, 4 miles off La Costa Island, Lee County. The test was to be drilled jointly by the California Co. and Coastal Petroleum Co. Mobile Oil Co. completed a dry hole and abandoned a 12,525-foot wildcat in Santa Rosa County, about 10 miles south of the Alabama line and 50 miles southeast of the Citronelle field in Alabama. The decision to drill came after nearly 2 years of geophysical and geological studies covering 235,000 acres in western Florida and southern Alabama.

Florida Southern Oil Co., a subsidiary of Frontier Refining Co., Jacksonville, exercised its option to buy a 100-acre tract near Drummond Point, and began construction of a $15 million refinery, expected to be completed by late 1961. The company signed a long-term contract with U.S. Oil of Louisiana, Inc., for 10,000 barrels per day of crude oil with deliveries scheduled to start July 1962.

Digitized by Google

Gulf Oil Co. announced that construction had begun on a new petroleum and products terminal on Drummond Point near Jacksonville, that would cost $3.5 million and be completed late in 1961. The company also completed expansion of its multi-State division office in Jacksonville, at a cost of $1 million.

## REVIEW BY COUNTIES

Mineral production was recorded in 41 of 67 counties, 3 more than in 1959. Polk, Dade and Hillsborough, in order of value, were again the three leading mineral-producing counties. Polk County furnished 43 percent of the total mineral production value, Dade furnished 13 percent, and Hillsborough 12 percent. Other important mineral producing counties, in order of value, were Hernando, Clay, Flagler, Gadsden, and Broward, each having a total value of more than $5 million, and Citrus and Duval Counties, having values over $2 million, each. Crushed limestone was produced in 20 counties; sand and gravel in 12; phosphate rock and crushed oystershell in 6; clay in 5; titanium concentrates, lime, and peat in 4; and perlite and vermiculite were processed in 3 counties, each, zircon in 3 and cement in 2. The county with the largest percentage increase in value during the year was Taylor with 154 percent over 1959. Of the leading 10 counties, Sumter, Polk, and Hernando had the greatest increases in mineral production value, 17, 7, and 7 percent, respectively, over 1959; total mineral production value of these 10 counties was $163.2 million, 92 percent of the total State value.

**Alachua.**—Total value of mineral production increased 62 percent over 1959. Listed in order of output, the Newberry Corp. (Newberry Corp. quarry), Williston Shell Rock Co. (Buda and Haile quarries), Ocala Lime Rock Co. (Haile quarry), and W. & M. Construction Co., Inc. (Norfleet quarry), a new quarry in the county, crushed limestone for use in concrete, as roadstone and screenings, and for agriculture. Eighty-nine percent of the total tonnage was transported by railroad and eleven percent by truck.

**Bay.**—Taylor Sand Co. (Taylor mine) and Cato Sand Co. (Mill Bayou mine) produced building and paving sand; all of the sand was transported by truck.

**Broward.**—Broward County ranked eighth in value of mineral production, for the second consecutive year, and was third in stone output. Crushed stone decreased 25 percent in quantity and 17 percent in value compared with 1959, the record year. Sand and gravel output increased over 400 percent in tonnage and value, a new record. Ten companies crushed limestone at thirteen quarries; a new quarry reporting for the first year was R. H. Wright, Inc. (Green quarry). The three leading quarries, in output, were Hollywood quarries (Broward County quarry), Maule Industries, Inc. (Prospect quarry), and R. H. Wright, Inc. (Green quarry). Meekins, Inc., operated three quarries (Oakland Park No. 5, Hollywood No. 1, and Deerfield No. 4 quarries); R. H. Wright operated two quarries (Green and Wright quarries). Broward County Highway Department crushed limestone for use in its road construction program. Crushed lime-

Digitized by Google

TABLE 9.—Value of mineral production in Florida, by counties[1]

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Alachua | $635,126 | $1,030,731 | Limestone. |
| Bay | (2) | (2) | Sand and gravel. |
| Broward | 6,233,292 | (2) | Limestone, sand and gravel. |
| Citrus | 2,562,813 | 2,522,756 | Limestone, phosphate rock, miscellaneous clay. |
| Clay | (2) | (2) | Ilmenite, zircon, staurolite, miscellaneous clay. |
| Collier | (2) | (2) | Petroleum, limestone, natural gas. |
| Columbia | (2) | (2) | Limestone, phosphate rock. |
| Dade | 23,310,400 | 23,642,909 | Cement, limestone, sand and gravel, lime. |
| Duval | (2) | (2) | Rutile, ilmenite, oystershell, zircon. |
| Escambia | 406,239 | 356,812 | Sand and gravel. |
| Flagler | (2) | (2) | Cement, limestone. |
| Gadsden | (2) | 6,727,050 | Fuller's earth, sand and gravel, miscellaneous clay. |
| Gilchrist | (2) | (2) | Phosphate rock. |
| Glades | ---------- | (2) | Sand and gravel. |
| Gulf | (2) | (2) | Magnesium compounds, lime. |
| Hendry | (2) | (2) | Limestone. |
| Hernando | 8,333,638 | 8,893,350 | Do. |
| Hillsborough | 21,221,344 | 20,798,784 | Cement, phosphate rock, oystershell, peat, gemstones. |
| Indian River | (2) | (2) | Rutile, ilmenite, zircon, limestone. |
| Lafayette | 182,700 | 209,088 | Limestone. |
| Lake | 573,157 | 585,786 | Sand and gravel. |
| Lee | (2) | (2) | Limestone, oystershell. |
| Leon | 75,850 | 110,545 | Sand and gravel. |
| Levy | 825,939 | 784,152 | Limestone. |
| Manatee | (2) | (2) | Limestone, oystershell. |
| Marion | (2) | (2) | Limestone, lime. |
| Monroe | (2) | (2) | Limestone. |
| Orange | (2) | (2) | Peat. |
| Palm Beach | (2) | (2) | Limestone, peat. |
| Pasco | (2) | (2) | Limestone. |
| Pinellas | (2) | (2) | Oystershell, marl, limestone. |
| Polk | 65,755,924 | 76,812,386 | Phosphate rock, sand and gravel. |
| Putnam | (2) | (2) | Sand and gravel, kaolin, peat. |
| St. Johns | ---------- | (2) | Limestone. |
| St. Lucie | (2) | (2) | Sand and gravel. |
| Sarasota | ---------- | (2) | Limestone. |
| Sumter | (2) | (2) | Do. |
| Suwannee | (2) | (2) | Do. |
| Taylor | 763,400 | 1,940,000 | Lime. |
| Volusia | (2) | (2) | Sand and gravel. |
| Walton | (2) | (2) | Oystershell. |
| Undistributed | 32,566,178 | 32,505,651 | |
| Total | 163,446,000 | 176,920,000 | |

[1] The following counties are not listed because no production was reported: Baker, Bradford, Brevard, Calhoun, Charlotte, DeSoto, Dixie, Franklin, Hamilton, Hardie, Highlands, Holmes, Jackson, Jefferson, Liberty, Madison, Martin, Nassau, Okaloosa, Okeechobee, Osceola, Santa Rosa, Seminole, Union, Wakulla, and Washington.

[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."

stone was used chiefly for concrete, roadstone, and screenings and was transported primarily by truck. Florida Silica Sand Co., Inc. (Pegram mine) and Davie Sand Corp. (Ft. Lauderdale mine) produced sand for building and fill purposes, respectively. Dade-Broward Rock Co. (Opa Locka mine) produced building sand and gravel. All three sand and gravel producers reported for the first year.

**Citrus.**—Citrus County ranked ninth in value of mineral production. Crushed limestone output decreased slightly from 1959 due to decreased requirements for stone used in cement. General Portland Cement Co. (Citrus County quarry) crushed limestone and mined miscellaneous clay for use in manufacturing cement. Colitz Mining Co. (Blue River quarry) produced limestone for concrete, roadstone, and screenings; Crystal River Quarries, Inc. (Crystal River quarry), for agricultural purposes. Both Colitz and Crystal River were new operations reporting for the first year.

Digitized by Google

Kibler-Camp Phosphate Enterprise (Enterprise mine) the only hard-rock phosphate producer in the State, mined 77,000 tons of phosphate rock valued at $670,000; tonnage decreased slightly, but value increased over 1959.

Soft-rock phosphate was produced at five mines by five companies; total output decreased 5 percent in quantity and increased 4 percent in value over 1959. Producers, in order of output, were Sun Phosphate Co. (Dunnellon mine), the largest producer in the State, Soil Builders, Inc. (Mincoll mine), Kellogg Co. (Kellogg mine), Camp Phosphate Co. (Hernando mine) and Superior Phosphate Co. (Bar mine). All of the phosphate rock was used for agricultural purposes and as a feed additive.

**Clay.**—Clay County ranked fifth in value of mineral production, moving up from sixth in 1959. Total mineral production value increased 5 percent over 1959, due principally to increases in ilmenite, zircon, and staurolite production. E. I. du Pont de Nemours & Co., Inc. (Highland and Trail Ridge mines) produced ilmenite, zircon and staurolite; ilmenite and staurolite output increased 11 and 4 percent, respectively, and zircon output decreased slightly from 1959.

Solite Corp., a subsidiary of Southern Lightweight Aggregates Co. (Russell mine) mined miscellaneous clay for producing aggregate for use in structural concrete and masonry. The company was listed in 1959 as the Florida Solite Corp., but changed its name to Solite Corp. in 1960. The company is in its second year of operation in the State.

**Collier.**—Collier County was the only county reporting petroleum and natural gas production. All of the output came from Sunniland field. Production of petroleum decreased 13 percent and natural gas production 12 percent from 1959.

Industrial Limerock, Inc. (Sunniland quarry) and Sunniland Limerock Co. (Sunniland quarry) crushed limestone for concrete, roadstone and screenings; total output was 2 percent less than in 1959. Sixty-four percent of the stone was transported by truck and 36 percent by railroad.

**Columbia.**—Loncala Phosphate Co. (Fort White mines), mined soft-rock phosphate which was processed at its Lake City Junction plant; tonnage and value more than doubled over 1959. The material was used primarily for agricultural purposes and as a livestock-feed additive.

Limestone Products, Inc. (Columbia City quarry), a new operation reporting for the first year, crushed limestone for concrete, roadstone, and screenings.

**Dade.**—Dade County was second in value of mineral production for the second consecutive year; total value of mineral production increased one percent over 1959. The county led the State for the third consecutive year in crushed stone output; 13 companies operated 18 quarries. The three leading producers were Ideal Crushed Stone Co. (Dade County quarry), Maule Industries, Inc. (Red Road, Tropical, and Homestead quarries), and Oolite Crushed Stone Co. (Richmond quarry). Stone production was 7.7 million tons valued at $9.7 million. New producers, reporting for the first year, were A. J. Capeletti, Inc. (Pennsuco quarry), Joe Daniel, Inc., division of A. J. Capeletti, Inc. (Joey quarry), Harry C. Delaney, Inc. (Peterson

Digitized by Google

quarry), and R. H. Wright, Inc. (Meekins quarry). Dade County Highway Department reported for the first year since 1948.

Lehigh Cement Co. (Miami mill) and General Portland Cement Co. (Everglades mill) both produced masonry and portland cement. Both companies crushed limestone for use in manufacturing cement. Total masonry and portland cement output declined for the first year since production began in 1958. Portland cement decreased 6 percent in quantity and 5 percent in value below 1959; masonry cement declined 3 and 2 percent, respectively.

Sand and gravel output and value more than doubled over 1959 and was higher than any year since 1954. Total output was 712,000 tons valued at $530,000. Sand producers, in order of output, were Sample Rock Co., Inc. (Opa Locka mine), fill sand; Des Rochers Sand Co., Inc. (Cape Florida mine), paving sand; and Sand Lake Development Co. (Miami mine), reporting production for the first year since 1955. Golden Brown Soil Co. (Miami mine) produced sand for fill and lawn dressing and paving gravel.

The city of Miami (Hialeah limekiln) produced 23,000 tons of quicklime valued at $244,000, for use as a water-softening and purification agent in its municipal waterplant. Output and value increased 6 percent over 1959.

Perlite, Inc., Hialeah, expanded perlite produced in Western States, for use in concrete, building plaster, and soil conditioning.

**Duval.**—Duval County was 10th in value of mineral production; total value increased 1 percent over 1959. Titanium Alloy Manufacturing Division of National Lead Co. (Skinner mine) produced and shipped ilmenite, rutile, and zircon. Zircon shipments by the company increased 2 percent over 1959. A small amount of monazite also was produced but none was shipped during the year. Rutile Mining Co. of Florida (Jacksonville operation) ceased mining in 1958, but made shipments in 1960 from stocks, although at a reduced rate from 1959.

White Shell Corp. (White Shell plant) produced 36,250 tons of crushed oystershell valued at $523,000, for use as poultry grit; tonnage decreased 10 percent and value 8 percent under 1959.

Tennessee Products & Chemical Corp. expanded perlite produced in Western States, at its plant near Jacksonville, for use in building plaster; tonnage and value remained the same as in 1959. Zonolite Co. exfoliated vermiculite at its plant near Jacksonville, using material mined by the company at deposits in South Carolina and Montana.

United States Gypsum Co. calcined gypsum at its plant near Jacksonville for use in manufacturing building products. The company completed a new plant to produce paper used in the manufacture of its products at the Jacksonville plant.

Kaiser Gypsum Co. of Oakland, Calif., exercised its option to purchase 34 acres near Jacksonville for the construction of a $3 million gypsum-products plant, expected to be completed in 1961.

Universal Atlas Cement Co., division of United States Steel Co., secured options on three sites along the eastern seaboard for cement distributing stations. One of the sites was near Jacksonville.

Florida Southern Oil Co., a subsidiary of Frontier Refining Co., Jacksonville, exercised its option to purchase a 100-acre tract near

Digitized by Google

Drummond Point, and began constructing a $15 million refinery, expected to be completed in late 1961. The company signed a long-term contract with U.S. Oil of Louisiana, Inc., for 10,000 barrels of crude oil per day, with deliveries to start in July 1962.

**Escambia.**—Sand and gravel, the only mineral commodity produced in the county, decreased 19 percent in quantity and 12 percent in value under 1959. Ward Gravel Co. (Century mine) and Campbell Sand and Gravel Co. (Flomaton mine) produced building sand and gravel; Clark Sand Co. (Pensacola mine) produced building sand only. Total output of the three mines was 387,000 tons valued at $357,000; about 95 percent of the material was processed, 66 percent was transported by railroad, and the remainder by truck.

**Flagler.**—Flagler County ranked sixth in value of mineral production, dropping from fourth place in 1959, as output of masonry and portland cements and crushed stone used in the manufacture of cement declined. Portland cement output decreased 15 percent in quantity and 14 percent in value; masonry cement decreased 16 percent in both quantity and value, and crushed stone output decreased 15 percent in quantity and 16 percent in value from 1959. Masonry and portland cements were manufactured by Lehigh Portland Cement Co. at its Bunnell mill; crushed stone was produced at its Coquina quarry. Shipments of cement from the Bunnell plant decreased for the second successive year.

**Gadsden.**—Florida, and Gadsden County, ranked first in the Nation in production of fuller's earth; the county, for the third year, ranked seventh in the State in total value of mineral production. Output of fuller's earth reached a new high; total production by three companies was 252,000 tons valued at $6.4 million, an increase in tonnage and value of 3 percent over 1959, the previous record year. Producers, in order of output, were Minerals and Chemicals Philips Corp. (La Camelia mine), Floridin Co., Inc. (Quincey mine which was acquired by Pennsylvania Glass Sand Co. in 1959), and Magnet Cove Barium Corp. (Havana mine). About midyear, Minerals & Chemical Corp. and Philips Brothers, Inc., merged to form Minerals and Chemicals Philips Corp.

Florida Gravel Co. (Chattahoochee mine) mined 213,000 tons of sand and gravel valued at $357,000; only the sand was processed. Both sand and gravel were transported equally by railroad and truck, 50 percent, each. Brundydge Sand Co. (Havana mine) produced 10,000 tons of sand valued at $7,000.

Appalachee Correctional Institute (Chattahoochee mine), produced miscellaneous clay for use in manufacturing brick.

**Gilchrist.**—Loncala Phosphate Co. (Mona mine), the only mineral producer in the county, mined and processed soft-rock phosphate; output increased 64 percent and value 70 percent over 1959 the largest increase since 1953.

**Glades.**—Caloosa Industries, Inc. (Ortona mine), a subsidiary of Lykes Bros., Tampa, mined building sand, all of which was transported by truck. The company, reporting for the first year, was the only mineral producer in the county.

**Gulf.**—Michigan Chemical Corp. produced magnesium compounds from sea water near Port St. Joe. Tonnage and value of refractory

Digitized by Google

and caustic-calcined magnesias increased considerably in 1960, the first full year of operation. The oxide was used by the plastic, refractories, fertilizer, chemical, paper, glass, and petroleum industries. In addition to magnesia, the company produced quicklime at its Port St. Joe limekiln for use in paper, chemical, and other industrial uses.

**Hendry.**—Caloosa Rock Corp. (La Belle quarry) crushed limestone for concrete aggregate, roadstone, and screenings. The company, in its third year of operation in the county, increased tonnage 51 percent and value 108 percent over 1959. All of the stone was transported by truck.

**Hernando.**—Hernando County ranked fourth in value of mineral production, moving up from fifth in 1959; value was 7 percent higher than in 1959. The county ranked second in output of crushed limestone, moving up from third in 1959; a record 5.4 million tons valued at $8.9 million was produced, increases of 11 percent in tonnage and 7 percent in value over 1959. Seven companies crushed limestone at seven quarries; two of the three leading crushed-limestone producers in the State, Florida Rock Products Co. (Lansing quarry) and Camp Concrete Rock Co. (Gay quarry) were first and second, respectively, in output. Other producers, in order of output, were Brooksville Rock Co. (Broco quarry), Lansing Rock Co. (Brooksville quarry), Aripeka Limerock Co., Inc. (Aripeka quarry), William P. McDonald Corp. of Florida (Cowrock quarry), and Hernando Limerock Co. (Brooksville quarry), a new operation reporting for the first year.

**Hillsborough.**—Hillsborough County, for the second consecutive year, ranked third in value of mineral production, led the State in production of crushed oystershell, and was second in peat. General Portland Cement Co. (Tampa mill) manufactured portland and masonry cements; portland cement shipments decreased 3 percent in quantity and 1 percent in value; masonry cement shipments decreased 36 percent in quantity and 35 percent in value. American Cyanamid Co. (Sydney mine) and the American Agricultural Chemical Co. (Boyette mine) produced land-pebble phosphate rock; combined marketable production decreased 7 percent in quantity but increased 3 percent in value over 1959.

Bay Dredging & Construction Co. (State Lease No. 639) crushed oystershell for use as roadstone, concrete, and poultry grit; output increased 17 percent in quantity and 5 percent in value, making 1960 a record year for the company. A small amount of agatized coral, as gem stone material, was collected by Robert Morgan in the Tampa Bay area.

Holmes Nurseries (Tampa), Ruth C. McKissick (Limona), and F. E. Stearns' Peat (Val Rico) produced both reed-sedge and humus-type peat. F. E. Stearns pulverized its product using a company-designed pulverizer. The county ranked second to Putnam in total peat production.

**Indian River.**—Florida Minerals Co. (Vero mine), mined beach sands and recovered ilmenite, rutile, and zircon. Ilmenite output increased 8 percent in quantity but value decreased from 1959. Zircon and rutile output decreased slightly. The Indian River County Highway Department crushed limestone for use in road building, for the first year. Airlite Processing Corp. of Florida, expanded perlite ob-

Digitized by Google

mined from out-of-State at its plant near Vero Beach; tonnage and value both decreased considerably from 1959.

**Lafayette.**—Williston Shell Lock Co. crushed limestone at its Bell quarry and established a record high for both quantity and value. [illegible] tons valued at [illegible]. The company also opened a new quarry, the Chauncey quarry, which it operated during the last 2 months of 1960, producing [illegible] tons of crushed limestone valued at [illegible]. Sixty-nine percent of the stone produced in the county was transported by railroad and the remainder by truck.

**Lake.**—Four companies mined building sand at four locations; output increased 11 percent in quantity and 2 percent in value over 1959 a record high for the county. Producers, in order of output, were E. E. Fams Industries, Inc. (Clermont mine), operated in 1960 by Clermont Sand Co.; Silver Lakes Estates (Leesburg mine); Central Sand Co. (Tavares mine), and Coldings White Sand Co. (Eustis mine), which also produced a small amount of blast sand and reported for the first year. All of the sand was processed; 54 percent was transported by railroad and the remainder by truck.

The Florida Division of Oakland Consolidated Corp. of Michigan started construction of a new sand plant west of Clermont, with a capacity of 7,500 tons per day.

**Lee.**—West Coast Rock Co. (Fort Myers quarry) crushed limestone for use in concrete, roadstone, and screenings; tonnage and value increased considerably over 1959. Most of the stone was transported by truck.

Oystershell was dredged by three companies operating on separate State leases; output totaled 52,400 tons valued at $96,000, a decrease in both quantity and value from 1959. Producers, in order of output, were Fort Myers Shell Co. (Lease No. 1052), Fort Myers Shell Co. (Lease No. 1044), a new operation reporting for the first year, and Fort Myers Dredging Co. (Lease No. 1218).

**Leon.**—Three companies mined building sand at three locations; total production was 79,000 tons valued at $111,000, an increase of 39 percent in quantity and 46 percent in value over 1959. Producers, in order of output, were Asa Maige Sand Co. (Northeet mine), Middle Florida Sand Co. (Tallahassee mine), and Johnson Sand Co. (Northeet mine). All of the sand was processed and was transported by truck.

**Levy.**—Five companies crushed limestone from five quarries for use as concrete, roadstone, and screenings, and for agricultural purposes; total output was 414,200 tons valued at $784,000, a decrease of 82 percent in tonnage and 5 percent in value below 1959, the lowest recorded output since 1954. Producers, listed in order of output, were United Limerock Co. (Williston quarry), Dixie Lime Products Co. (Lebanon quarry), Levy County Lime Rock Co. (No. 1 quarry) and Ralph Swiney (Miller quarry), reporting for the first year. The stone was transported 57 percent by railroad and 43 percent by truck.

**Manatee.**—Southern Dolomite Co. (Palmetto quarry) crushed limestone for agricultural purposes and transported it by rail and truck; tonnage and value both decreased from 1959. Bradenton Dredging and Shell Co. (Lease No. 61) crushed oystershell for concrete and roadstone; output decreased considerably below 1959.

Digitized by Google

**Marion.**—Three companies and one noncommercial producer crushed limestone at five quarries; output decreased 8 percent in quantity and 23 percent in value under 1959. Producers, in order of output, were Dixie Lime Products Co. (Plant No. 3 quarry), Ocala Lime Rock Co. (Kendrick quarry), and Cummer Lime and Mfg. Co. (Kendrick and Martin quarries). The material was used for concrete, roadstone, and agricultural purposes and was transported 62 percent by railroad, 22 percent by truck, and 16 percent by water. The Marion County Highway Department, reporting for the first year since 1949, crushed limestone for use in its road program. Dixie Lime Products Co. (Ocala No. 1 limekiln) produced quicklime for building and chemical purposes; tonnage and value increased slightly over 1959.

**Monroe.**—Charley Toppino and Sons, Inc. (Stock Island quarry) crushed limestone for use in concrete block, ready-mixed concrete, and fill; output increased 55 percent over 1959. R. H. Wright, Inc. (HDSSF quarry), a new producer, crushed limestone for concrete, roadstone, and screenings. All stone was transported by truck.

**Orange.**—The county was third in peat production; Daetyler Peat mine (Orlando) and Raymond Johnson (Apopka) produced 8,521 tons of humus and reed-sedge peat; output decreased 3 percent from 1959. The peat was used primarily as a soil conditioner. No other mineral commodities were produced in the county.

**Palm Beach.**—The county ranked fourth in peat production; Latham Farms (West Palm Beach) produced peat for use as a soil conditioner; tonnage and value increased over 1959. Belle Glade Rock Co. (Belle Glade quarry) crushed limestone for concrete, roadstone, and screenings; output decreased considerably from 1959. Palm Beach County Highway Department, the largest noncommercial producer of crushed limestone in the State, crushed 173,000 tons valued at $96,000, for highway use.

**Pasco.**—Camp Concrete Rock Co. (Ivy quarry) and Port Richey Mining Corp. (Hudson quarry), a new producer, crushed limestone for concrete, roadstone, and screenings. Combined output of the two companies increased county output 26 percent in tonnage and 55 percent in value over 1959. All of the material was transported by truck.

**Pinellas.**—Benton and Co. (Lease No. 460) dredged and crushed oystershell for use in concrete and road material; output decreased 53 percent in quantity and 42 percent in value from 1959. Seminole Shell Co., Inc. (Dunedin quarry), the only marl producer in Florida, produced marl for use as a filler, and reported for the first year. Pinellas County Highway Department, which reported for the first time, crushed limestone for use in roadbuilding.

**Polk.**—Polk County led in mineral production value, and established a new record. The county furnished 43 percent of the total State value, $76.8 million compared with $65.8 million in 1959, an increase of 17 percent. The increase was due to expanding output of phosphate rock and continued sand and gravel production. Marketable land-pebble phosphate-rock output came from 12 mines operated by 8 companies established a record high. Output totaled 11 million tons valued at $74.6 million, an increase of 8 percent in quantity and 18 percent in value over 1959. The three leading county producers, in order of out-

Digitized by Google

put, were International Minerals & Chemical Corp. (Achan and Noralyn mines), Virginia-Carolina Chemical Corp. (Clear Springs and Homine mines), and American Agricultural Chemical Co. (South Pierce mine). Other companies operating in the county were American Cyanamid Co. (Orange Park mine), Swift and Co. (Varn and Watson mines), Davidson Chemical Co. Division of W. R. Grace Co. (Bonny Lake and Clark-James mines), Armour Agricultural and Chemical Co. (Armour mine) and Smith-Douglass Co., Inc. (Tenoroc mine). New plants and major expansions of existing facilities highlighted the industry in the county in 1960. International Minerals & Chemical Corp. Bartow, announced plans for a new $1 million calcining plant at Noralyn to process material for Electric Reduction Co., Toronto, Ontario, Canada. The company installed new equipment designed to control both liquid and gas wastes in chemical processing of phosphate rock. Virginia-Carolina Chemical Co., Bartow, tripled the superphosphate capacity of its Nichols plant, as part of a $10 million expansion program, and completed a new $1 million flotation plant at the Clear Springs mine. The company sold its interest in Gulfcoast Transit Co. and Mid-South Towing Co., phosphate rock and coal haulage companies. American Agricultural Chemical Co., Pierce, began constructing a new washer at Palmetto, with completion scheduled for 1961. American Cyanamid Co., Brewster, acquired approximately 3,500 acres of phosphate-rock-bearing land during the year and expanded its phosphoric acid plant to 200,000 tons per year. The company installed a large chain mill and scrubber in its triple superphosphate building. Swift and Co., Bartow, announced an increase of its phosphoric acid capacity that would double output. Davison Chemical Co. Division of W. R. Grace Co. closed its Pauway No. 4 mine near Lakeland and opened a new mine, the Clark-James. The company also completed its new 400-ton-per-day sulfuric acid plant, expanded its phosphoric acid facilities, and installed pollution control equipment. Armour Agricultural Chemical Co., Fort Meade, announced that construction would begin in 1961 on a new phosphoric acid and triple superphosphate facility, estimated to cost $10 million. Smith-Douglass Co., Inc., Plant City, perfected a new phosphate ore-flotation process that demonstrated savings in equipment and operation costs.

Polk County was the leading sand and gravel producing county and mined 3.1 million tons of sand valued at $2.3 million. This was 45 percent of the State output, and a decrease of 8 percent in tonnage and 5 percent in value below 1959. Ten companies produced sand from 10 mines. The three leading producers of sand and gravel in the State, all in Polk County, in order of output, were Mammoth Sand Co. (Lake Wales mine), Pembroke, Standard Sand Co. (Standard mine) Davenport, and Oak Ridge Sand Co. (Achan mine) near Mulberry. Most of their output was used for building and paving purposes. Other producers, also listed in order of output, were Gall Silica Sand Co., Inc. (Lake Wales mine), Lake Wales Independent Sand Co. (Independent mine), Lake Wales Concrete Sand Co. (Lake Wales mine), MacCalla Bros. (Polk County mine), Waverly Road Sand Co. (Winter Haven mine), Davenport Sand Co. (Polk County mine), and Superior Sand Co. (Winter Haven mine), a new company reporting

Digitized by Google

for the first year. Ninety-nine percent of the sand was processed; 96 percent was transported by railroad and 4 percent by truck.

**Putnam.**—The county ranked first in peat production, and second in sand and gravel production for the third consecutive year. Sand output totaled 955,000 tons valued at $824,000, a 23-percent decrease in tonnage and 18-percent decrease in value from 1959. Eight companies produced building, paving, glass, or fill sand at eight mines, two more than in 1959. Producers, in order of output, were Diamond Interlachen Sand Co., Inc. (Interlachen mine); All-Florida Sand Co. (Interlachen mine); Keuka Sand Co. (Putnam County mine); Edgar Plastic Kaolin Co. (Edgar mine); Southern Materials Co. of Florida (Putnam Hall mine), a new company reporting for the first year; Keystone Sand Co. (Grandin mine); Chesser and Strickland Sand Co. (Hollister mine), new in 1960; and United Clay Mines Corp. (Crossley mine). Ninety-five percent of the sand was processed; 50 percent was transported by truck and 50 percent by railroad.

Kaolin was produced by Edgar Plastic Kaolin Co. (Edgar mine) and United Clay Mines Corp. (No. 4 mine); quantity and value decreased 2 and 7 percent, respectively, below 1959; the clay was used in pottery, stoneware, floor and wall tile, and clay crucibles.

Putnam County ranked first in peat output, up from third in 1959. Glen Saint Mary Nurseries Co. (Glen Saint Mary) and Troxlers Peat Co. (Florahoma) mined 13,850 tons of humus peat for use as a soil conditioner; output increased 128 percent over 1959, establishing a record high for the county.

**St. Johns.**—Phillip McLeod (St. Johns County quarry) resumed limestone crushing after an absence of 1 year; quantity and value were about the same as in 1958. The stone was used for concrete, roadstone, and screenings and was transported by truck.

**St. Lucie.**—Fort Pierce Sand and Material Co. (Pierce mine operated by Dixie Sand Co. in 1959), mined paving sand; tonnage and value more than trebled over 1959. None of the sand was processed and all was transported by truck.

**Sarasota.**—Florida Dolomite Co. (Sarasota quarry) resumed crushed limestone production for agricultural purposes, after an absence of 1 year; tonnage increased 8 percent and value 15 percent over 1958. Fifty percent of the stone was transported by railroad and 50 percent by truck.

**Sumter.**—Three companies crushed limestone at three quarries, for concrete, roadstone, and agricultural purposes; total output increased 32 percent in quantity and 56 percent in value over 1959. Quality Lime Products Co. (Sumterville quarry), the largest producer in the county, and Nobleton Rock Co. (Nobleton quarry) crushed limestone for roadstone and concrete; Peacock Lime Rock Co. (Wildwood quarry) crushed limestone for agricultural uses and reported for the first year. The stone was transported 69 percent by railroad and 31 percent by truck.

**Suwannee.**—Florida Rock Products Corp. (Suwannee quarry) and Live Oak Stone Co. (Live Oak quarry) crushed limestone for roadstone, concrete, and screenings. Live Oak's quarry was sold to Florida Rock Products Corp. Division of Shands and Baker, about midyear and Live Oak Stone Co. began operating on adjacent property. Com-

Digitized by Google

bined output of the two operations increased 91 percent in quantity and 70 percent in value over 1959.

**Taylor.**—Taylor was the largest lime producing county. Buckeye Cellulose Corp. (Foley limekiln) produced 97,000 tons of quicklime for use in its own paper plant for water purification and causticizing. The company, in its second year of operation, announced plans for increasing plant output of bleached kraft and dissolving pulps by 33,000 tons per year, 13 percent above 1960 capacity. It was anticipated that lime needs of the captive operation would increase accordingly.

**Volusia.**—White Sand and Materials Co. (New Smyrna Beach mine) produced building sand, and produced gravel for the first year since 1955; total tonnage and value decreased from 1959. Houser Concrete Co. (Deland mine) produced a small amount of building sand and reported for the first year since 1955.

**Walton.**—Bay Towing and Dredging Co. (Lease No. 753), the third largest oystershell producer in the State, crushed oystershell for use in concrete, roadstone, and screenings. Output increased 33 percent over 1959 and was larger than any year since 1957.

# The Mineral Industry of Georgia

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Geological Survey of Georgia.**

By James L. Vallely [1] and Garland Peyton [2]

SUBSTANTIAL increases in the production value of barite, kaolin, and stone and smaller increases in cement, fuller's earth, miscellaneous clay, scrap mica, peat, and sand and gravel, carried Georgia's 1960 mineral production to a new high of $91.2 million, 6 percent above 1959. Decreases in output of feldspar, sheet mica, talc, coal, bauxite, iron ore, iron oxide pigments, and manganese ores were more than offset by the gains of the other minerals.

Clays comprised 44 percent of the State's total production value; stone, 41 percent; sand and gravel, 3 percent; other nonmetals, 11 percent; and coal, peat, and metals, slightly more than 1 percent.

Among the States, Georgia led in the output of kaolin, marble, and crude iron oxide pigments and was second in fuller's earth, third in barite and mica, and fourth in feldspar.

**TABLE 1.—Mineral production in Georgia [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays.....thousand short tons.. | 3,352 | $36,232 | 3,519 | $40,160 |
| Coal.....do.... | 7 | 34 | 4 | 21 |
| Gem stones | (3) | (3) | (3) | (3) |
| Iron ore (usable).....thousand long tons, gross weight.. | 186 | 945 | 128 | 613 |
| Manganese ore.....short tons, gross weight.. | 1,547 | (4) | | |
| Mica, sheet.....pounds.. | 18,461 | 119 | 10,218 | 89 |
| Peat.....short tons.. | 4,288 | (4) | 6,904 | 73 |
| Sand and gravel.....thousand short tons.. | 2,909 | 2,982 | 3,338 | 3,047 |
| Stone.....do.... | 13,771 | 35,973 | 14,297 | 37,033 |
| Talc and soapstone.....short tons.. | 53,692 | 107 | 40,200 | 88 |
| Value of items that cannot be disclosed: Barite, bauxite, cement, feldspar, iron oxide pigments, manganiferous ore, mica (scrap) and values indicated by footnote 4 | | 10,979 | | 11,181 |
| Total Georgia [5] | | 86,262 | | 91,203 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Weight not recorded.
[3] Less than $1,000.
[4] Figure withheld to avoid disclosing individual company confidential data.
[5] Total adjusted to eliminate duplicating value of clays and stone.

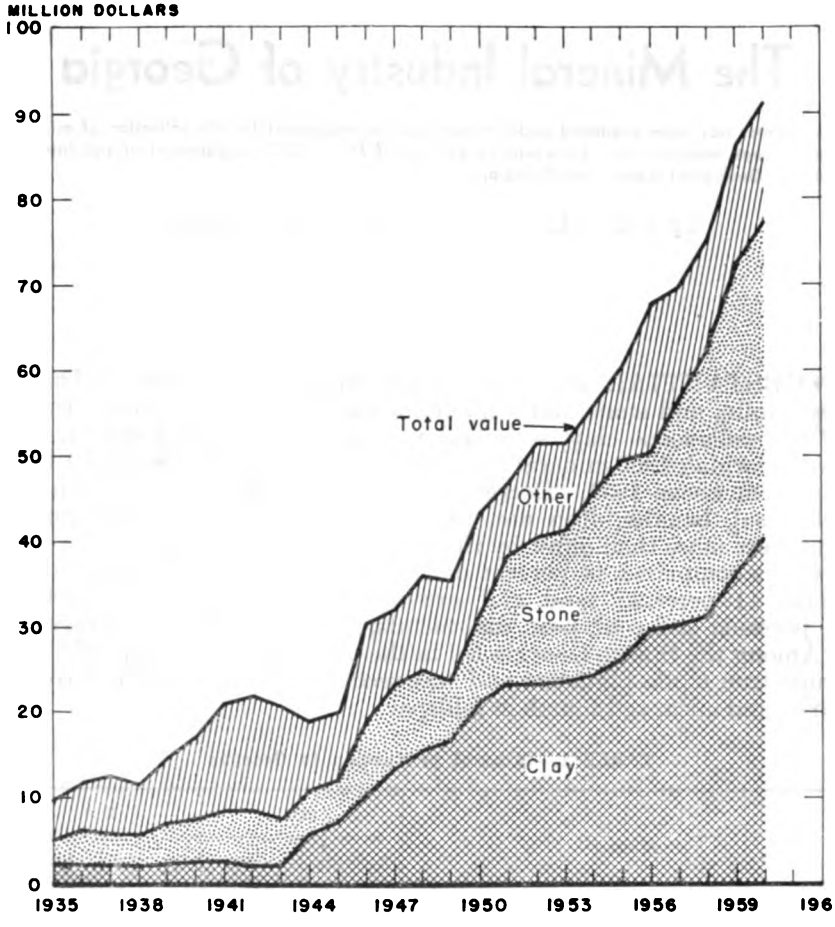

FIGURE 1.—Value of clays and stone, and total value of mineral production in Georgia, 1935–60.

**Employment and Injuries.**—Employment in the mineral industries was slightly higher than in 1959. Total man-hours worked increased from 15.9 to 16.2 million, an increase of 2 percent, and the number of men working daily increased from 7,200 to 7,492; however, the average active days decreased from 276 to 270. Employment in nonmetal mines increased 8 percent, more than offsetting the losses in quarries and mills (2 percent), sand and gravel plants (12 percent), metal mines (42 percent), and coal mines (40 percent).

Four fatal accidents were recorded, three in quarries and mills, one more than in 1959, and one at sand and gravel mines compared with none in 1959. The number of nonfatal accidents declined from 424 to 364, and the overall injury-frequency rate improved 15 percent. As in 1959, no accidents were recorded for coal or metal mines.

**TABLE 2.—Employment and injuries in the mineral industries**

| Year and industry | Active operations | Men working daily | Average active days | Man-hours worked | Fatal injuries | Non-fatal injuries | Injuries per million man-hours |
|---|---|---|---|---|---|---|---|
| 1959: | | | | | | | |
| Nonmetal mines | 80 | 3,582 | 282 | 8,089,463 | ---------- | 227 | 28 |
| Quarries and mills | 66 | 3,096 | 277 | 6,854,085 | 2 | 184 | 27 |
| Sand and gravel mines | 35 | 349 | 281 | 784,432 | ---------- | 13 | 17 |
| Metal mines | 19 | 153 | 123 | 150,281 | ---------- | ---------- | ---------- |
| Coal mines | 4 | 20 | 154 | 24,720 | ---------- | ---------- | ---------- |
| Total | 204 | 7,200 | 276 | 15,902,981 | 2 | 424 | 27 |
| 1960: [1] | | | | | | | |
| Nonmetal mines | 70 | 3,886 | 280 | 8,697,775 | ---------- | 174 | 20 |
| Quarries and mills | 72 | 3,187 | 264 | 6,724,995 | 3 | 179 | 27 |
| Sand and gravel mines | 39 | 315 | 273 | 687,100 | 1 | 11 | 17 |
| Metal mines | 20 | 92 | 118 | 87,158 | ---------- | ---------- | ---------- |
| Coal mines | 2 | 12 | 155 | 14,886 | ---------- | ---------- | ---------- |
| Total | 203 | 7,492 | 270 | 16,211,914 | 4 | 364 | 23 |

[1] Preliminary figures.

**Trends and Developments.**—Numerous plant expansions and improvements were recorded in the State's mineral industry in 1960. Chattahooche Brick Co. completed its fifth tunnel kiln and increased plant capacity 30 percent.[3] Merry Bros. Brick and Tile began constructing the first of two kilns and accessory equipment to cost $4 million. Stevens Fire Brick Co. installed new mixing and blending equipment and planned to overhaul firing and clay-preparation facilities. Bestwall Gypsum Co. began construction of an acoustical ceiling tile plant as an addition to its new plant[4] completed in 1959. Consolidated Quarries Corp., with crushed granite plants at Lithonia and Douglasville, merged with Georgia Marble Co. The new Yatesville granite quarry of Tyrone Rock Products Co.,[5] and Georgia Lightweight Aggregates Co.'s slate-expanding plant[6] at Rockmart were described. Numerous improvements and expansions were completed at quarries and plants in the Elberton granite district.

Humble Oil Co. completed drilling the first of two test wells in South Georgia;[7] it was the 94th dry hole drilled in the State since 1938.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Barite.**—Primary barite production, after a 2-year decline, increased 33 percent in tonnage and 26 percent in value. Crushed and ground barite were shipped principally for barium chemicals and well-drilling muds. Production came from Bartow County.

Digitized by Google

**Cement.**—Shipments of portland cement were slightly higher than in 1959, with a 4-percent increase in value; masonry cement shipments were lower in tonnage and value. Out-of-State shipments were principally to Florida, with smaller tonnages to Alabama and South Carolina. Marquette Cement Manufacturing Co. produced portland and masonry cements at Rockmart; Penn-Dixie Cement Corp. manufactured portland cement at Clinchfield. Marquette completed its plant modernization program at Rockmart, and construction of a new kiln and other facilities was underway at Penn-Dixie's Clinchfield plant.

**Clays.**—Clay ranked first in value of mineral production and accounted for 44 percent of the State total, compared with 42 percent in 1959. Kaolin production exceeded 2 million tons for the first time, tonnage and value increasing 9 and 11 percent, respectively, over 1959. Fuller's earth production was 93,700 tons valued at $1,777,000, a decrease of 6 percent in tonnage but an increase of 3 percent in value. Miscellaneous clay was down 1 percent in tonnage and up 2 percent in value.

Georgia led the Nation in production of kaolin and ranked second in fuller's earth. Twenty companies mined kaolin in 9 counties; 6 companies produced fuller's earth in 5 counties (Decatur, Grady, Jefferson, Thomas, and Twiggs), and miscellaneous clay was mined by 14 companies in 11 counties. The leading kaolin producers were: Georgia Kaolin Co., J. M. Huber Corp., Minerals and Chemicals-Phillips Corp., and Southerns Clays, Inc. Producers of fuller's earth were: Cairo Production Co., Inc., Diversey Corp., Econo-Sorb Co., Georgia-Tennessee Mining and Chemical Co., Milwhite Co., Inc., and Waverly Petroleum Products Co.

**Feldspar.**—Appalachian Minerals Co. mined feldspar rock from several locations in Jasper County and produced flotation concentrate for glass and pottery uses at its mill near Monticello.

**Gem Stones.**—A small quantity of asterated quartz and corundum were the only gem materials reported in 1960.

**Gypsum.**—Bestwall Gypsum Co. (Brunswick plant) and National Gypsum Co. (Savannah plant) calcined imported gypsum for manufacturing wallboard and other gypsum products.

**Mica.**—Sheet mica production dropped to the lowest level since 1951. Output was 10,200 pounds valued at $88,600 compared with 18,500 pounds valued at $118,900 in 1959, a decrease of 45 percent in quantity and 26 percent in value. Included in the total were 3,150 pounds of full-trimmed mica and 4,546 pounds of punch obtained from 78,772 pounds of hand-cobbed mica. All hand-cobbed and full-trimmed mica was sold to the Government through the General Services Administration (GSA) at the Spruce Pine (N.C.) purchase depot. Scrap mica decreased 22 percent in tonnage but increased 21 percent in value. Output of ground mica was 27 percent below 1959. Scrap mica was mined in Cherokee and Hart Counties. Except for a few pounds in Cherokee County, all sheet mica came from Hart, Pickens, and Upson Counties.

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other counties."

**Sand and Gravel.**—Sand and gravel production increased 15 percent in tonnage but only 2 percent in value. Sand production increased 16 percent in tonnage and 1 percent in value; however, output of gravel, little changed from 1959, was 10 percent higher in value. Output of both paving and structural sand increased 21 percent. All other sands, except for fill and railroad ballast, decreased in tonnage and value. Twenty-eight companies produced sand only in 22 counties, and 5 companies produced sand and gravel in Bibb, Muscogee, and Richmond Counties. Brooks, Crawford, Muscogee, Talbot, Taylor, and Thomas were the principal producing counties. Atlanta Sand & Supply Co. (Crawford Co.), Bannockburn Sand Co. (Brooks Co.), Brown Bros. (Talbot Co.), Dawes Silica Mining Co. (Dougherty, Effingham, Long, and Thomas Counties), Howard Sand Co., and Taylor Sand Co. (Taylor Co.) were the State's leading producers.

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other."
[2] Includes agstone, cement, terrazzo, roofing, and uses indicated by footnote 1.

**Stone.**—Stone was produced in 31 counties by 49 companies and 3 Government-and-contractor operations. Dimension granite was produced in 6 counties from 26 quarries, crushed granite in 16 counties from 22 quarries, and crushed limestone in 8 counties from 10 quarries. Crushed and dimension marble was produced in Pickens County and crushed marble only in Gilmer County. Crushed slate was mined in Bartow, Murray, and Polk Counties, quartzite in Richmond County, dimension sandstone in Pickens County, crushed sandstone in Polk County, and byproduct quartz in Jasper County. Leading producers of crushed granite were Stockbridge Stone Division of Vulcan Materials Co., Tyrone Rock Products Co., and Weston and Brooker Co.; leading producers of dimension granite were Coggins Granite Industries, Inc., Worley Bros. Granite Co., Inc., and Davidson Granite Co. Georgia Marble Co. produced crushed and dimension marble, and Marble Products Co. crushed marble only. Dalton Rock Products Co. and the two cement companies, Marquette Cement Manufacturing Co. and Penn-Dixie Cement Corp., were the leading crushed limestone producers. Superior Stone Co., Division of American-Marietta Co. was the only producer of quartzite. Slate was mined for roofing granules by the Funkhouser Mills Division of Ruberoid Co. and Georgia Talc Co. and for manufacturing lightweight aggregate by Georgia Lightweight Aggregate Co.

**Talc and Soapstone.**—Georgia Talc Co., with mines and mills at Chattsworth, Murray County, was the only talc producer. Production of crude talc decreased 25 percent in tonnage and 18 percent in value from 1959. Sales of sawed and ground talc also were lower than in 1959.

**Vermiculite.**—Zonolite Co. produced exfoliated vermiculite at its Atlanta plant.

## METALS

**Bauxite.**—American Cyanamid Co., the only producer, mined crude bauxite in Floyd and Sumter Counties. The bauxite was dried at the company's Hall Station drying plant, Bartow County, and shipped for chemical use.

**Gold and Silver.**—The last production of gold and silver in Georgia was in 1953. The history of gold mining in Georgia shows a large production from placer mining and important production from gold-

Digitized by Google

quartz veins. About 80 percent of the total gold production of the State was from the placer operations before 1880. There was a steady production of about 5,000 ounces of gold yearly from lode mines during the period 1880–1905. The increase in the price of gold in 1933 led to a revival of placer mining, with a sustained small production during the period 1933–42. Production since 1942 has been very small. Table 11 shows the production of gold and silver, 1830–1960.

**Iron Ore.**—Shipments of brown iron ore declined for the third consecutive year, and were down 31 percent in tonnage and 35 percent in value. Most of the output came from the Stewart-Webster County area south of the Fall Line, with less than one-third from the Bartow-Polk County area. Leading producers were Brown-Nuggett Mining Co., Dunbar and Layton, and Smith Mining Co.

Crude iron oxide pigments sold or used decreased 21 percent in tonnage but only 6 percent in value. Finished pigment sales also were lower in tonnage and value. New Riverside Ochre Co. in Bartow County was the only producer.

**Manganese.**—Manganiferous ore (−35 percent Mn) for use in making steel was mined by three companies in Bartow County. Production and value increased more than 30 percent. No manganese ore (+35 percent) was produced during the year.

## MINERAL FUELS

**Coal.**—Two operators, excluding those producing less than 1,000 tons annually, mined bituminous coal in Walker County. Tonnage decreased 43 percent and value was 38 percent below 1959.

**Peat.**—Output of peat was 61 percent higher than in 1959; production came from Lowndes and Screven Counties, and was used principally for agricultural and horticultural purposes.

## REVIEW BY COUNTIES

Mineral production was reported from 76 of Georgia's 159 counties, compared with 70 counties in 1959. Twenty counties had production valued above $1 million; 10 exceeded $2 million and made up 74 percent of the State's total production. The leading counties, in descending order were: Twiggs, Washington, Pickens, Wilkinson, Polk, Houston, De Kalb, Bartow, Elbert, and Richmond.

**Baldwin.**—General Refractories Co. mined kaolin for use in refractories.

**Bartow.**—Value of mineral production increased 14 percent. Increased barite, limestone, and iron ore production more than offset losses in slate, iron oxide pigments, and manganese.

Barite producers were: B. R. Cain Mining Co., T. E. Johnsey, Paga Mining Co., and New Riverside Ochre Co. The latter company also was the State's only producer of crude and finished iron oxide pigments. Thompson-Weinman & Co. operated a grinding plant at Cartersville to produce fillers, or extenders, from barite, kaolin, marble, mica, and other minerals. Funkhouser Mills Division of the Ruberoid Co. mined slate to produce flour and roofing granules. Marquette Cement Manufacturing Co. quarried limestone for use in its cement plant at Rockmart. Hodge Mining Co., Joe Mosteller, and Mosteller Bros. mined brown iron ore. Lake Mining Co., Mosteller Bros., and Oakland Heights Mining Co. mined manganiferous ore.

TABLE 15.—Value of mineral production in Georgia, by counties [1]—Continued

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Whitfield | $11,900 | (2) | Limestone, miscellaneous clay. |
| Wilkinson | 5,242,161 | $5,382,449 | Kaolin. |
| Undistributed | [3] 43,065,521 | 43,270,770 | |
| Total | 86,262,000 | 91,203,000 | |

[1] The following counties are not listed because no production was reported: Appling, Atkinson, Bacon, Baker, Banks, Barrow, Ben Hill, Berrien, Bleckley, Brantley, Bryan, Bullock, Burke, Calhoun, Butts, Camden, Candler, Carroll, Catoosa, Charlton, Chattahoochee, Clay, Clinch, Coffee, Colquitt, Cook, Coweta, Crisp, Dawson, Dodge, Early, Echols, Emanuel, Forsyth, Glascock, Greene, Habersham, Haralson, Harris, Heard, Irwin, Jackson, Jeff Davis, Jenkins, Johnson, Lanier, Laurens, Lee, Liberty, Lincoln, Lumpkin, McDuffie, McIntosh, Marion, Miller, Morgan, Newton, Oconee, Paulding, Peach, Pierce, Pike, Putnam, Quitman, Randolph, Schley, Seminole, Spalding, Stephens, Taliaferro, Terrill, Toombs, Treutlen, Turner, Union, Walton, Wayne, Wheeler, Wilcox, Wilkes, Worth.

[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."

[3] Revised figure.

**Bibb.**—Burns Brick Co. and Cherokee Brick and Tile Co. mined miscellaneous clay for manufacturing brick and other clay products. Macon Brick & Block Co., Sand Supplier, Inc., and Cornell-Young Co. produced building and paving sand. Cornell-Young Co. also produced a small tonnage of gravel.

**Brooks.**—Bannockburn Sand Co. mined building, paving, and railroad ballast sand near Valdosta.

**Chatham.**—Fitzgerald-Montgomery Sand Corp. mined building sand. Bestwall Gypsum Co. (new plant completed at Brunswick in late 1959) and National Gypsum Co., Savannah, calcined imported crude gypsum for board, lath, and plaster.

**Chattooga.**—Wolf Creek Sand Co. produced unwashed foundry sand.

**Cherokee.**—Georgia Talc Co. (Waleska mine) and Thompson-Weinman & Co. (Brady mine) produced scrap mica (sericite), and Glenn Young produced a minor quantity of sheet mica.

**Clarke.**—Gainesville Stone Co. quarried granite at Athens for riprap, aggregate, and roadstone.

**Clayton.**—Tyrone Rock Products Co. continued to expand production of crushed granite at its new Clayton quarry.

**Cobb.**—Stockbridge Stone Division of Vulcan Materials Co. quarried and crushed granite for concrete and roadstone at the Kennesaw quarry.

**Columbia.**—Georgia Vitrified Brick & Clay Co. mined miscellaneous clay at the Campania mine.

**Crawford.**—Atlanta Sand and Supply Co. mined building, paving, blast, engine, and other sands near Gaillard. Middle Georgia Pottery Co. mined miscellaneous clay at Lizella for use in manufacturing clay products.

**Dade.**—Dave L. Brown Co. quarried and crushed limestone at Morganville for concrete and roadstone.

**Decatur.**—The Milwhite Co. mined and processed fuller's earth at Attapulgus. Econo-Sorb Co. produced a small tonnage of fuller's earth, but ceased operations early in the year.

**De Kalb.**—Tonnage and value of both crushed and dimension granite were higher than in 1959. Consolidated Quarries Division of Georgia Marble Co. and Stone Mountain Grit Co., Inc., quarried granite for

Digitized by Google

riprap, concrete, road metal, poultry grit, filter, and stone sand. Davidson Granite Co., Inc., produced riprap, rubble, curbing and flagging, and dressed architectural stone. Stone Mountain Granite Corp. and J. T. Reagin Granite Co. quarried rubble, curbing, and flagging. Stamps Sand Co. mined paving sand.

**Dooley.**—Chandler Bros. (Unadilla mine) was a new producer of brown iron ore.

**Dougherty.**—Dawes Silica Mining Co., Musgrove Sand Co., and Quick Service Sand Co. mined building sand; Garrett Base Materials Co., paving sand; and Albany Lime & Cement Co., filter sand.

**Douglas.**—Consolidated Quarries Division of Georgia Marble Co. quarried and crushed granite at Douglasville for riprap, concrete, and road metal. J. Tom Bell mined building sand for local use.

**Effingham.**—Dawes Silica Mining Co. produced building, blast, filter, molding, and other sands.

**Elbert.**—The value of monumental, rough, and dressed dimension granite produced by companies operating quarries in the county totaled over $2 million, 54 percent higher than in 1959. Twelve companies were active during the year: Coggins Granite and Marble Industries, Comolli Granite Co., Continental Granite Co., Doves Creek Granite Co., Elberton City Quarries, Elberton Granite Finishing Co., Elberton Granite Industries, Inc., Harpers Quarry, Inc., M. W. Kantala & Sons, Robin Blue Quarries, Inc., A. G. & M. H. Veals, and Worley Bros. Granite Co.

**Evans.**—Evans Concrete Products Co. mined building sand.

**Fannin.**—Fannin County Highway Department quarried and crushed granite for roadstone at Blue Ridge, and Willingham-Little Division of Georgia Marble Co. crushed limestone for concrete, roadstone, agricultural stone, terrazzo, and other uses.

**Fayette.**—Tyrone Rock Products Co. quarried and crushed granite for concrete and roadstone.

**Floyd.**—American Cyanamid Co. mined bauxite from three pits and kaolin from another; Oconee Clay Products Co. mined shale for use in its clay-products plant at Milledgeville. Ready-Mixed Concrete Co. and Floyd County Highway Department quarried and crushed limestone for railroad ballast, concrete, and roadstone.

**Fulton.**—Hitchcock Corporation and Stockbridge Stone Division of Vulcan Materials Co. quarried and crushed granite for concrete and roadstone. W. J. Griffins, C. J. Ross, and Thompson Bros. Sand Co. produced building, paving and fill sand for local use. Atlanta Brick and Tile Co. and Chattahooche Brick Co. mined clay for use in brick and other clay products. Zonolite Corp. exfoliated crude vermiculite shipped into the State at its Atlanta plant.

**Gilmer.**—The Willingham-Little Division of Georgia Marble Co. mined and crushed marble at Whitestone for terrazzo, roofing granules, agricultural stone, and other uses.

**Glynn.**—Gray Towing Co. produced building and filter sands. Bestwall Gypsum Co. completed the first full year of operation of its new calcining and gypsum products plant at Brunswick.

**Gordon.**—Plainville Brick Co. mined shale for use in its brick plant at Plainville.

Digitized by Google

**Grady.**—Cairo Production Co. mined and processed fuller's earth for absorbent uses.

**Gwinnett.**—Stockbridge Stone Division of Vulcan Materials Co. and The State Board of Correction produced crushed granite for concrete and roadstone.

**Hall.**—Gainesville Stone Co. quarried and crushed granite for concrete, roadstone, and riprap.

**Hancock.**—Weston and Brooker Co. produced crushed granite for concrete, roadstone, and railroad ballast at Granite Hill. Middle Georgia Quarrying Co. opened a new dimension granite quarry near Sparta.

**Hart.**—Funkhouser Mills Division of the Ruberoid Co. mined mica schist and produced ground mica at Hartwell. Arthur Mining Co. Taylor mine, and Payne Bros. produced hand-cobbed and full-trim mica. Stokes Buchanan, Ralph Cunningham, and Mitchell Lumber Co., produced full-trim mica.

**Henry.**—Stockbridge Stone Division of Vulcan Materials Co. quarried granite for concrete and roadstone.

**Houston.**—Penn-Dixie Cement Corp. mined clay and limestone and manufactured portland cement at Clinchfield. Georgia Limerock Co. quarried and crushed limestone, principally for agricultural use.

**Jasper.**—Appalachian Minerals Co. mined feldspar rock from several locations and produced flotation-grade feldspar and byproduct quartz at its Monticello mill.

**Jefferson.**—Georgia-Tennessee Mining and Chemical Co. mined fuller's earth near Wrens for absorbent uses.

**Jones.**—Hitchcock Corp. (Gray quarry) and Weston-Brooker Co. (Ruby quarry) produced crushed granite for concrete and roadstone, riprap, and railroad ballast.

**Lamar.**—Tyrone Rock Products Co. completed the first full year of operation at its Yatesville quarry and produced crushed granite for concrete and roadstone.

**Long.**—Dawes Silica Mining Co., Inc., mined building sand at Ludowici.

**Lowndes.**—Georgia Peat Moss Co. produced peat for agricultural and horticultural uses.

**Macon.**—American Cyanamid Co. mined kaolin at the Cavender bauxite mine.

**Madison.**—Coggins Granite Industries, Inc., quarried rough monumental granite from the Piedmont quarry near Carlton.

**Meriwether.**—Lehigh-Portland Cement Co. mined kaolin near Greenville for use in its Florida cement plants.

**Mitchell.**—Bridgeboro Stone Co., Inc., crushed limestone for concrete, roadstone, and agricultural use.

**Montgomery.**—R. W. Geiger mined building and paving sand at Mt. Vernon.

**Murray.**—Georgia Talc Co. mined crude talc from the Georgia, Lindsey, and Southern mines and marketed crayons and ground talc for insecticides, roofing, rubber, and textiles; the company also quarried and crushed slate for roofing granules.

Digitized by Google

**Muscogee.**—Brown Sand and Gravel Co. and Calhoun Sand and Gravel Co. operated pits near Columbus, and Stockbridge Stone Division of Vulcan Materials Co. quarried granite for riprap, concrete, and roadstone. Alabama Aggregates Co. closed its quarry in January.

**Oglethorpe.**—Seven companies quarried dimension granite. Elbert County Granite Co., Inc., produced both rough and dressed monumental stone, and the following produced rough monumental stone only: American Granite Quarries, Inc., Dixie Granite Quarries, Enterprise Granite Co., Hoover Granite Quarries, Inc., Liberty Granite Co., and Oglethorpe Granite Co.

**Pickens.**—Pickens County ranked third in the State in value of mineral production. Georgia Marble Co. quarried and dressed marble for building and monumental stone at Tate. Marble Products Co. of Georgia (Whitestone mine) and Calcium Products Division of Georgia Marble Co. mined and crushed marble for terrazzo, roofing granules, filler, whiting, agricultural, and other uses. Carl Johnson and Hardy Johnson quarried dimension sandstone for flagging and rubble. A. B. Schuer mined a small quantity of hand-cobbed mica.

**Polk.**—Polk County ranked fifth in the State in value of mineral production with a 4-percent increase in value over 1959. Marquette Cement Manufacturing Co. produced portland and masonry cements at Rockmart from clay and sandstone mined in Polk County and limestone mined in Bartow County by the cement company. Georgia Lightweight Aggregate Co. mined and expanded slate for lightweight aggregate at Rockmart. Only a small tonnage of brown iron ore was produced by two operators during the year.

**Pulaski.**—Pope and Chandler mined brown iron ore near Hawkinsville.

**Rabun.**—Rabun Quarries, Inc., produced crushed granite for concrete and roadstone.

**Richmond.**—Albion Kaolin Division of Interchemical Corp. mined kaolin for refractories; Georgia-Carolina Brick & Tile Co., Georgia Vitrified Brick & Clay Co., and Merry Bros. Brick & Tile Co. mined miscellaneous clay for brick and other clay products. Superior Stone Co. Division of American-Marietta Co. quarried and crushed quartzite for concrete and roadstone. Richmond Sand Co. and Speer Sand and Gravel Co. produced sand and gravel for building, paving, and railroad ballast.

**Rockdale.**—Kelly Granite Co., Inc., quarried dimension granite for rubble, curbing, and flagging.

**Screven.**—Atlanta Peat Co. produced humus peat near Sylvania for agricultural and horticultural uses.

**Stewart.**—Brown iron ore production decreased for the second successive year, dropping 35 percent in both tonnage and value. Producers were: H. E. Bowden, Dunbar and Layton, Luverne Mining Co., and Smith Mining Co.

**Sumter.**—American Cyanamid Co. mined kaolin from the Holloway mine and bauxite from the Thigpen mine.

**Talbot.**—Brown Bros. and Taylor Sand Co. mined building and paving sand.

Digitized by Google

**Tattnall.**—Phillips Sand Co. mined a small tonnage of building sand for local use.

**Taylor.**—Butler Sand Co. and Howard Sand Co. produced building sand.

**Telfair.**—Flanders Bros. mined building sand for local use.

**Thomas.**—Dawes Silica Mining Co. produced building, glass, filler, and other industrial sands. Waverly Petroleum Products Co. mined and processed fuller's earth for absorbent uses.

**Tift.**—Quality Sand Co. mined building sand for local use.

**Towns.**—J. M. Steinoff collected a small quantity of corundum.

**Troup.**—Fred O. Scruggs collected a considerable quantity of rose quartz.

**Twiggs.**—Twiggs County ranked first in the State in value of mineral production. Georgia Coating Clay Co., Georgia Kaolin Co., J. M. Huber Corp., and Southern Clays, Inc., mined and processed kaolin for whiteware and pottery, refractories, paper filling and coating, and many other filler uses. Stevens Fire Brick Co. mined kaolin for fire brick and other refractories, and The Diversey Corp. mined and processed fuller's earth for insecticides, absorbents, and filtering uses.

**Upson.**—Southern Mining Co. and Joe L. Snyder produced hand-cobbed and full-trimmed mica.

**Walker.**—Georgia Limestone Co. quarried and crushed limestone for concrete and roadstone. Key-James Brick Co. mined shale for the manufacture of brick at the Chattanooga, Tenn., plant. W. T. Blevins and Powell & Hixon were the State's only bituminous coal producers.

**Ware.**—E. W. Pafford mined building sand near Waycross.

**Warren.**—Weston and Brooker Co. quarried and crushed granite at Camak for concrete, roadstone, riprap, and railroad ballast.

**Washington.**—Washington County ranked second in the State in value of mineral production. Kaolin, the only mineral produced, was used for whiteware, pottery, refractories, and heavy clay products; and for paper coating and filling, and many other filler purposes. Producers were American Industrial Clay Co., Anglo-American Clay Corp., Champion Paper and Fibre Co., Minerals and Chemicals-Phillips Corp., Thiele Kaolin Co., United Clay Mines Corp., and General Refractories Co.

**Webster.**—Brown-Nuggett Mining Co. was the only brown iron ore producer.

**White.**—Helen Sand and Rock Co. mined building sand for local use.

**Whitfield.**—Dalton Brick & Tile Corp. mined miscellaneous clay for the manufacture of brick and other clay products. Dalton Rock Products produced crushed limestone for concrete, roadstone, and agricultural stone.

**Wilkinson.**—Wilkinson County ranked fourth in the State in value of mineral production. Kaolin was mined principally for paper filling and coating, rubber, and paint by Evans Clay Co., M & W Clay Co., and Minerals and Chemicals-Phillips Corp. Refractory kaolin was mined by Harbinson-Walker Refractories Co., D. C. Hardie, and Oconee Clay Products Co.

# The Mineral Industry of Hawaii

By L. E. Davis [1] and R. Y. Ashizawa [2]

THE VALUE of Hawaii's mineral output established a new record of $9.3 million in 1960, compared with $7.6 million in 1959. An outstanding event of the year was the first full-scale production of portland cement at two new plants on Oahu Island. The anticipated gains in the production of sand and gravel, and stone materialized when the quantities required to keep pace with Hawaii's construction boom reached 4 million tons valued at $7.8 million, compared with 3.5 million tons and $6.7 million in 1959. Increases in the output of trachyte and volcanic cinder were also substantial.

**Employment.**—In 1960, Hawaii's mineral industry reported to the Bureau of Mines that 695 employees worked a total of 1,031,353 manhours. There were 2 fatalities and 35 nonfatal lost-time injuries. The fatalities occurred at separate basalt quarries on Oahu Island and were the result of falls.

**Consumption, Trade, and Markets.**—There was no notable change in the marketing pattern of the mineral industry. None of the minerals produced and processed in Hawaii was exported. Interisland shipments were limited to sand and volcanic cinder barged from Molokai to Oahu and trachyte from the island of Hawaii to Oahu. Mineral-material receipts from the Mainland consisted chiefly of cements, pe-

**TABLE 1.—Mineral production in Hawaii [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Cement—thousand 376-pound barrels | ---- | ---- | 113 | $571 |
| Pumice—thousand short tons | 276 | $548 | 361 | 676 |
| Sand and gravel—do | 463 | 1,253 | 490 | 1,324 |
| Stone—do | 3,034 | 5,480 | 3,535 | 6,443 |
| Value of items that cannot be disclosed: Clays, gem stones, and lime | ---- | 363 | ---- | 353 |
| Total Hawaii [2] | ---- | 7,630 | ---- | 9,254 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Total adjusted to eliminate duplicating value of raw materials used in manufacturing cement and lime.

troleum products, natural asphalts, salt, and special construction, chemical, and fertilizer materials.

**Trends and Developments.**—Heavy demand for construction materials raised Hawaii's mineral production to a new record in 1960. The State's structural concrete and concrete-products industry became virtually self-sufficient when two new cement plants went on stream. Hawaii's first steel plant, constructed for Hawaiian Western Steel, Ltd., Honolulu, began production of ingots for reinforcing rod at Barbers Point in July. Scrap metal obtained locally was utilized. The new $1.5-million electric arc furnace facility was built adjacent to the company's rolling mill which had been hot-rolling Canadian ingots since 1959 into reinforcing rod.

With a combined annual production capacity of 2.7 million barrels (more than double Hawaii's past annual rate of consumption), the new $25.5-million cement industry took steps to expand further the use of portland cement concrete into all areas of construction, including homes and highways. Technical advancements in Hawaii's construction industry, which brought about increased use of prestressed, precast, thin-shell, and lift-slab concrete, and concrete tile, block, and pipe, adversely affected a structural clay products industry, which discontinued operations during 1960. Future requirements for clay tile and brick appeared limited and would necessitate imports.

**Legislation and Government Programs.**—State management of Hawaii's mineral-resources program was assigned as a function of the Division of Water and Land Development, Department of Land and Natural Resources, pending final approval by the State legislature.

Metallurgical research on the extraction of alumina from Hawaii's bauxitic soils, conducted under an agreement negotiated early in 1959 by the then Territory of Hawaii, was completed during 1960 at the Bureau of Mines Rolla Metallurgy Research Center at Rolla, Mo. Beneficiation methods were applied to the bauxite samples from Kauai, Maui, and Hawaii, and a detailed report on the study was being prepared for the State government and for subsequent release as a Bureau of Mines Report of Investigations. Additional metallurgical research on bauxitic soils of Hawaii, including the recovery of titanium and iron minerals, continued at the Rolla Center under the Bureau's program to develop methods of utilizing domestic deposits of aluminous materials.

The Federal Geological Survey continued its drilling and sampling project on Kauai to determine the distribution, quantity, and type of bauxite resources on the island. In the summer of 1960, the project was enlarged to include reconnaissance of bauxitic soils on Maui. A progress report on the drilling tests and sampling of the deposits in eastern Kauai was placed on open file in Honolulu by the Geological Survey.

No new ordinances or resolutions affecting Oahu's minerals or mineral-extraction operations were adopted by the City and County of Honolulu in 1960. Correspondence from the office of the attorney general stated that the Land Court of the State of Hawaii was presented with a question on the validity of mineral reservations contained in Royal Patents issued upon Land Commission Awards. The supreme court of Hawaii was expected shortly to consider the question

Digitized by Google

which is both unique and important to Hawaii, since title to large areas of land is burdened with the reservation.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Cement.**—Kilns of the new cement plants on Oahu Island were fired, and full-scale production of portland cement began in August 1960. Hawaiian Cement Corp. and Permanente Cement Co. established their highly automated plants at Barbers Point and Waianae, respectively, with a combined annual capacity of 2.7 million barrels. Raw-material sources were coral limestone from nearby company quarries, gypsum from San Marcos Island, Mexico, silica sand from South Viet Nam and California, and other materials from local and Mainland sources. Both plants were operated for several months and were then shut down temporarily in November for operational adjustments while the cements were being tested pending approval for use in Federal projects. Sales of the locally produced portland cement during 1960 were for use in non-Government construction projects, and shipments of cement from the Mainland continued.

**Clays.**—A dwindling market for structural clay products and the encroachment of residential development on clay deposits and on an existing plant site forced Hawaii's clay brick and tile producers on Oahu to discontinue operations in 1960. Waialae Tile, Ltd., operators of the former Wilsonite Brick Co., Ltd., Wilson claypit near Waimanalo and the brick and tile plant on Oili Road, Honolulu, lost its plant-site lease. The plant was situated on estate land earmarked for construction of tract homes. GasprO, Ltd., ceased mining clay at Kokokahi and discontinued production of clay products at its Honolulu plant during the latter part of 1960. The company established a new plant at Waimanalo to fabricate its Stahlton prestressed concrete floor and roof systems.

**Gem Stones.**—Maui Divers of Hawaii, at Lahaina, Maui, continued to skin dive for substantial quantities of black coral at a depth of more than 200 feet in the channel between Maui and Lanai Islands. The precious gem material, which was cut and polished and fashioned into freeform jewelry at the Maui Diver's lapidary, was fast becoming a popular tourist item. Pex of Hawaii, Honolulu, sold tumble-polished Hawaiian olivine that had been collected during prior years.

**Lime.**—The quantity of quicklime and hydrated lime sold or used by producers on Oahu and Maui was slightly lower in 1960, compared with 1959. Increased sales of lime to the building trade and to pineapple canneries offset much of the drop in lime shipped to sugar mills for use in clarifying cane juice. During 1960, Hawaii's cane sugar industry, the principal market for lime, felt the effects of the 1958 strike that disrupted the 2-year harvesting cycle. The Oahu lime plant used coral limestone as its raw material; at the Maui plant, coral beach sand was calcined to produce lime.

**Pumice (Volcanic Cinder).**—Volcanic cinder used for construction and repair of roads on Hawaii Island, particularly in the Kapoho area which was buried by lava in January 1960, represented much of the

Digitized by Google

rise in the total volume quarried in 1960, compared with 1959. The need for good roads to reduce the cost of truck haulage was apparent at many of the sugar and pineapple plantations in the Hawaiian Islands. Although some companies were surfacing their main haulage systems with asphaltic concrete, others maintained excellently compacted haul roads utilizing volcanic cinders. Increased quantities of lightweight trachyte were quarried at Puuwaawaa on Hawaii Island for local use and for shipment to Oahu. Volcanic cinder from Molokai Island was shipped to Oahu for use in lightweight concrete and concrete products. On Oahu, the demand for black cinder from Makiki Round Top in Honolulu was substantially above that of the previous year.

**Salt.**—Construction of a plant and pond facilities at Barbers Point, Oahu, to produce solar-evaporated salt from sea water was announced by Smith Chemical Products, Inc., Honolulu. The company leased 8 acres of ground on the ocean front for its plant and concentrating ponds, and expected to make limited shipments of salt beginning in the latter half of 1961. Virtually all of Hawaii's requirements of salt for live stock feed, food processing, and other industrial and domestic uses, including table salt, were shipped from plants in California and Louisiana in 1960.

**Sand and Gravel.**—Output of natural coral beach and dune sands and basaltic streambed sand and gravel increased from 463,000 tons in 1959 to 490,000 tons in 1960. The quantity of coral sand obtained from the northern shores of Oahu decreased. Oahu's additional requirements of sand for concrete and mortar were barged from Molokai Island and obtained from Barbers Point on Oahu Island, where sand was produced from dredged coral. Sand requirements on the other islands were supplied from beach, dune, and stream deposits. Basaltic streambed gravel was used by county and plantation crews and by local contractors for road base, fill, and drain rock. Stream deposits were also sources of the smoothly rounded pukapuka (holey) bluestone cobbles used for the imu (underground rock oven) during the traditional and frequently held Hawaiian luaus.

**Stone.**—The volume of stone quarried in the Hawaiian Islands increased to 3.5 million tons in 1960 from 3 million tons in 1959. Output of basalt rock quarried and crushed, primarily for base course and concrete aggregate, accounted for nearly 65 percent of the stone yield. The rock was commercially produced at four quarries on Oahu, three quarries on Hawaii, and one each on Kauai, Maui, and Molokai, and at various noncommercial government or contractor project sites. A portable crusher was shipped from Hawaii Island to Lanai in 1960 to process basalt rock for highway construction. The quantity of coral limestone consumed in the State increased from 526,000 tons in 1959 to 846,000 tons in 1960. Oahu Island, where limestone quarry operations were predominant, lost one quarry and gained three new quarries. Limestone was used for base course, concrete aggregate, agricultural purposes, and for manufacturing cement and lime. The output of miscellaneous stone, including Hawaiian aa, fieldstone, moss rock, and decomposed rock, declined, owing principally to the limited uses for the material.

**Vermiculite.**—Vermiculite of Hawaii, Inc., a successor to Vermiculite of Hawaii, Ltd., moved its office and plant facilities in Honolulu,

Digitized by Google

from Mokumoa Street to Mapunapuna Street. Crude vermiculite mined near Libby, Montana, was exfoliated at the plant to produce lightweight aggregate for heat and sound insulation, plaster and concrete aggregate, roofing, and horticultural uses.

## MINERAL FUELS

The first stage of the Standard Oil Co. of California refinery at Barbers Point, Oahu, was completed in October 1960. Dedication ceremonies were conducted on November 3, and production was started on 13 products ranging from asphalt through various grades of jet fuels, diesel, and liquefied petroleum gases. The company simultaneously announced reductions in its wholesale prices of gasoline, fuel oil, kerosine, diesel oil, and stove oil. Crude oils from Sumatra and Arabia were pumped to the refinery through offshore submarine pipelines connecting the refinery to the tanker mooring area 2 miles off the southeast coast of Barbers Point. The second-phase construction of the catalytic cracking plant and related facilities for production of high-octane motor gasoline, aviation gasolines, and other products was expected to be completed by the end of 1961, instead of mid-1962 as previously announced. In 1960, the Hawaii Division of the Union Oil Co. of California completed construction of its storage and distributing facilities on Maui Island for gasolines, fuel oil, and solvents.

## REVIEW BY ISLANDS

**Hawaii.**—James W. Glover, Ltd., operated a stationary crushing and screening plant at its main Hilo facility and a portable crusher at Kalopa to process basalt rock and aa rock. The portable crusher was shipped to Lanai Island for a highway project during the latter part of 1960. The J. M. Tanaka, Inc., quarry, southeast of Kailua-Kona, was the source of basalt and aa rock prepared by the producer primarily for use in asphaltic concrete. Corps Construction, Ltd., in the same area, processed aa rock obtained near Keauhou. The 299th pit near Hilo Airport supplied aa rock for road base. Decomposed volcanic rock and cinder from deposits on plantation lands in the Papaaloa and Paauhau areas and on cattle-ranch lands west of Honokaa were used for roads. The Kau Desert was the source of road and fill material used by maintenance crews at the Hawaii National Park. Streambeds in the North Kohala District and beach deposits in the Puna District yielded some sand and gravel for local projects.

**TABLE 2.—Value of mineral production in Hawaii, by counties**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Hawaii | $1,374,934 | $1,394,001 | Stone, pumice (volcanic cinder), sand and gravel. |
| Honolulu | 5,317,011 | 6,526,046 | Stone, sand and gravel, cement, lime, pumice (volcanic cinder), clays. |
| Kauai | 208,463 | 563,673 | Stone, sand and gravel, pumice (volcanic cinder). |
| Maui | 729,669 | 770,124 | Stone, pumice (volcanic cinder), sand and gravel, lime, gem stones. |
| Total | 7,630,000 | 9,254,000 | |

Digitized by Google

Substantial quantities of volcanic cinder and ash were obtained near Kapoho by Kuwaye Bros., Inc., for use as road base and were screened for use as a soil additive. Plantation operators, including Hawaiian Agricultural Co., Ltd., at Pahala, Honokaa Sugar Co., at Haina, Kohala Sugar Co., at Hawi, and the Pepeekeo Sugar Co., as well as the county maintenance crews obtained cinder from company-owned pits for road construction and repair. Trachyte was quarried and processed at Puuwaawaa by Volcanite, Ltd., for local use as lightweight concrete aggregate and for shipment to Oahu via Kawaihae Harbor.

**Kauai.**—One of the last of the plantations in the Hawaiian Islands to change its sugarcane haulage system from railroad to truck, the Lihue Plantation Co., utilized nearly 150,000 tons of coral limestone during 1960 for road construction. The coral was dredged from the reef and stockpiled toward the mountain (mauka) from Kapaa from May through December 1959.

Grove Farm Co., Ltd., quarried and processed coral limestone and volcanic cinder near Koloa and basalt rock near Puhi, primarily for sale to building and paving contractors. Output of the Koloa cinder which was used to maintain the company's plantation haul roads decreased; output from both the limestone and basalt operations was greater than in 1959. Decomposed basalt rock for use as road base was quarried near Kilauea by crews of the Kilauea Sugar Co., Ltd. The crews used a bulldozer to work the single-bench quarry.

McBryde Sugar Co., Ltd.'s Kapeku Cinder Hill deposit, 1.8 miles south of Kalahea, was the island's principal source of volcanic cinder sold and used for horticulture, road and driveway surfacing, concrete aggregate, and fill. The deposit consisted of clean black cinders on the northwest side of the hill and weathered cinder on the southeast side, both of which were consumed in relatively large quantities during 1960.

Virtually all of the accessible beaches from Haena along Highways 56 and 50 to Bonham, the Wahiawa Stream, and the Hanapepe and Waimea Rivers were sources of coral sand and basaltic streambed sand and gravel, used in concrete and for road maintenance.

**Lanai.**—James W. Glover, Ltd., Hilo, Hawaii Island, shipped its Kalopa portable crusher to Lanai Island, Maui County, for the Kaumalapau highway project. The crusher was set up at a site one-half mile east of Kaumalapau Harbor, where basalt and aa rock were quarried and processed for use as base course and concrete aggregate.

**Maui.**—Hawaiian Commercial & Sugar Co., Ltd., operated its rotary kiln and continuous hydrator facility near Lower Paia, utilizing coral beach sand to produce hydrated lime for the sugar, pineapple, and building construction industries. A new dust collector and a 22-foot stack were added to the lime plant in January 1960. The company also worked the Puuhele Cinder Pit near Maalaea and obtained substantial quantities of the volcanic cinder for concrete aggregate.

Crews from Baldwin Packers, Ltd., worked the Wahikuli cinder pit 2 miles northeast of Lahaina for volcanic cinder for road construction and maintenance. County road crews and contractors utilized cinder from the Honokohau ash pit and the Kahakuloa cinder pit in northwestern Maui and from the Puu Pane pit of the Haleakala

Digitized by Google

Ranch Co. near Makawao. Black cinder from the upper and lower banks of Puumahoe, west of the Makena post office, was sold by Ulupalakua Ranch, Ltd., in 60-pound bags and by the cubic yard to growers of orchids and other flowers and also for walkways and driveways. The maintenance crew of the Hawaii National Park used black cinder obtained from a bank near Red Hill at the summit of Haleakala Crater for repairing Park roads and trails.

The quarry and processing plant operated by Kahului Railroad Co. at Camp 10 near Puunene supplied all of the local requirements for crushed basalt rock used in concrete aggregate and for railroad ballast. Coral beach sand used to blend with fines from the rock crusher was obtained from the Kaa area at Kahului Bay. Coral sand from the Wailuku dunes and from Kaanapali beach were used primarily for maintenance of plantation roads, some of which were oil surfaced. The 2½-mile double-crescent-shaped Kaanapali beach, a source of sand for many years, was taken over by a resort development project near the end of 1960. Basaltic gravels hauled from various stream deposits were used by county crews for road maintenance.

Black coral gem material obtained from the deep channel between Lanai and Maui Islands was fashioned into jewelry by Maui Divers of Hawaii at Lahaina.

**Molokai.**—Honolulu Construction & Draying Co., Ltd., shipped substantial quantities of lightweight volcanic cinder from the Waieli cinder pit and coral sand from the Papohaku beach on Molokai, Maui County, to Oahu via the company-constructed Hale O Lono barge facility. A $150,000 dredging operation was begun by mid-1960 to enlarge the channel at the barge harbor to accommodate larger tugs for the company's $1.5-million sand and cinder project. Volcanic cinder used on Molokai for fill and road maintenance was obtained principally from the Mauna Loa, Kaunakakai, and Puuluahine cinder pits.

Molokai Rock & Equipment, the island's sole commercial supplier of quarried stone, sold and used crushed basalt rock from stockpiles maintained at its quarry and plant site at Manawainui Gulch near Kaunakakai. Local requirements of coral sand used for concrete aggregate were obtained chiefly from the Moomomi dunes. Basaltic gravels from streambeds were used for fill and road maintenance.

**Oahu.**—A record construction year and the completion of Hawaii's new cement plants on Oahu, Honolulu County, advanced the value of the island's mineral output to $6.5 million from $5.3 million in 1959. The total yield of stone quarried and crushed on Oahu for use as riprap, roadstone, and concrete aggregate and for manufacture of cement and lime rose from 2.2 million tons in 1959 to 2.6 million tons in 1960, with values of $3.9 million and $4.6 million, respectively.

Clark-Halawa Rock Co., Hawaii Division of Pacific Cement and Aggregates, Inc., San Francisco, operated a basalt quarry at Halawa Valley near Aiea and a limestone quarry near Lualualei. Pacific Concrete & Rock Co., Ltd., quarried basalt rock at the Palailai quarry near Ewa and limestone at its Kailua quarry. Basalt rock was quarried by Honolulu Construction & Draying Co., Ltd. (HC&D), at the Kapaa quarry on the Kailua side of Oahu and by Hawaiian Rock & Supply Co., Ltd., at the Kaena quarry near Camp Erdman.

Digitized by Google

Nanakuli Paving & Rock Co., Ltd., worked its Testa quarry near Nanakuli for coral limestone. Coral pits of the Ewa Plantation Co. and the Malaekahana and Laie quarries of the Kahuku Plantation Co. were sources of limestone used for construction and maintenance of plantation roads. Road crews of the City and County of Honolulu hauled coral limestone from stockpiles maintained at Laie, and maintenance crews at Schofield Barracks worked the quarry at Kolekole Pass.

GasprO, Ltd., produced quicklime and hydrated lime at its rotary kiln and continuous hydrator facility near Waianae, utilizing coral limestone purchased from Clark-Halawa's Lualualei quarry. The Waianae limestone quarry site, from which the lime plant had been obtaining its raw material, was sold during the year to a land-development group.

Three new coral limestone deposits on Oahu were opened for commercial use in 1960. Oahu Aggregates, Inc., established its dragline and processing plant operation at Barbers Point to produce a wide range of aggregates from base course to washed concrete and mortar sand. The entire operation was conducted in the course of creating a new harbor at Barbers Point. Sand from the plant supplemented the coral sands obtained by other producers from northern Oahu and eastern Molokai.

Hawaiian Cement Corp., jointly owned by American Cement Corp., Cyprus Mines Corp., and a Honolulu hui (group), opened its 533-acre coral limestone deposit at Barbers Point to supply basic raw material to its new 1-million-barrel dry-process cement plant. Permanente Cement Co. obtained coral limestone from its quarry site near Maile, 2 miles from its new 1.7-million-barrel wet-process cement plant. Both of the cement plants installed extensive dust-collection systems, television monitors, automated controls, and other equipment of the latest type.

Clay used for brick and tile was obtained near Kokokahi by GasprO, Ltd. The company discontinued its clay-products operation before the end of 1960. Waialae Tile, Ltd., liquidated its brick and tile operation on Oili Road, near Waialae Avenue, Honolulu. Substantial quantities of black cinder were taken from stockpiles maintained at the Makiki Round Top cinder deposit to meet the demand for use as cushion under pipes and concrete slabs and for lightweight concrete aggregate. Large quantities of lightweight aggregate for Oahu's construction industry were shipped from a volcanic cinder deposit on Molokai by HC&D and from a trachyte deposit on the island of Hawaii by Volcanite, Ltd. Crude vermiculite from Montana was exfoliated at the relocated Honolulu plant of Vermiculite of Hawaii, Inc., and was used as lightweight aggregate in building products and in agriculture.

# The Mineral Industry of Idaho

**This chapter has been prepared under a cooperative agreement for the collection of mineral data between the Bureau of Mines, U.S. Department of the Interior, and the Idaho Bureau of Mines and Geology.**

By Frank B. Fulkerson,[1] Gary A. Kingston,[1] and Norman S. Petersen [1]

IDAHO mineral production in 1960 declined 18 percent, largely because of a 7-month strike in lead-zinc mines of the Coeur d'Alene mining region, Shoshone County. Output of all minerals was $57.4 million, compared with $70.2 million in 1959. The 1960 value was the lowest since 1946. Lead, zinc, and silver declined $10.3 million (24 percent) in value. A similar sharp decrease of $2.6 million (49 percent) was recorded in copper production. Cobalt, columbium-tantalum concentrate, and rare-earth metals were not produced in 1960. In contrast, the overall nonmetal output continued to increase, because of greater production of phosphate rock, even though several nonmetals, including sand and gravel, dropped in output.

An index measuring the change in the volume of production showed that the quantity of minerals produced was 87 (1959=100). The index was an average of the percentage increases or decreases from 1959 to 1960 in the quantity of the commodities produced, weighted by their 1960 values.

**Trends and Developments.**—Important new developments took place in nonmetal industries. J. R. Simplot Co. completed construction of a $1.5 million clay-beneficiation plant in Latah County; The Bunker Hill Co. finished erection of a $2 million phosphate-products plant at Kellogg; and J. R. Simplot Co. and Food Machinery & Chemical Corp. began to expand the capacity of their Pocatello phosphate-products plants.

The Federal Bureau of Mines and the Idaho Bureau of Mines and Geology reported widespread beryllium discoveries in the Sawtooth Mountains in south-central Idaho and in the Yellow Jacket Mountains, 80 miles to the north. Further prospecting and exploration was believed necessary to determine the extent and importance of the occurrences.

**Consumption, Trade, and Markets.**—A slowdown in business activity in Idaho as well as in the Nation was a principal factor affecting mineral production in 1960. Output of several mineral products declined because of lower construction activity. Employment in the construction industry dropped 5 percent, and the value of building per-

**TABLE 2.—Selected economic statistics**

| | 1959 | 1960[1] | Change, percent |
|---|---|---|---|
| Personal income: | | | |
| Total.....millions | $1,187.0 | $1,224.0 | +3 |
| Per capita | $1,804.0 | $1,824.0 | +1 |
| Construction activity: | | | |
| Building permits.....millions | $39.9 | $33.9 | −15 |
| Cement shipments to and within Idaho, thousand 376-pound barrels | 1,230.0 | 1,351.0 | +10 |
| Average weekly hours of construction workers | 37.7 | 37.3 | −1 |
| Mineral production.....millions | $70.2 | $57.4 | −18 |
| Factory payrolls.....do | $146.1 | $148.0 | +1 |
| Average monthly employment: | | | |
| Construction | 10,100.0 | 9,600.0 | −5 |
| Food processing | 8,600.0 | 9,300.0 | +8 |
| Lumber | 12,800.0 | 12,200.0 | −5 |
| All manufacturing | 30,300.0 | 29,900.0 | −1 |
| Total labor force | 261,200.0 | 261,800.0 | 0 |
| Unemployment | 13,000.0 | 14,200.0 | +9 |

[1] Preliminary figures.

Source: Survey of Current Business, Construction Review, Idaho Labor Market, Labor Force and Employment in Idaho, Distribution by Industry of Wages Paid for Covered Employment in Idaho, and Bureau of Mines.

mits issued by the principal cities decreased 15 percent. Employment declined despite several active road and other large projects. Construction was in progress on the Mountain Home Titan Missile Base, which will cost $40 million to complete. Regarding general economic conditions in the State, personal income received by Idaho residents from all sources increased, but the gain both in the State total and in the per capita figure was less than the U. S. advance because of the decline in construction, particularly in residential building, an unfavorable price for lumber, and depressed metal-mining production that resulted from the strike and poor markets.

**Employment and Injuries.**—Employment was reduced sharply by a strike and by mine closures. The phosphate fertilizer, phosphoric acid, and sulfuric acid industries were the only mineral industries to

Digitized by Google

record gains in employment, according to the Idaho Employment Security Agency.

**Legislation and Government Programs.**—Five contracts were active, compared with 11 in 1959, under the program of the Office of Minerals Exploration (OME), U.S. Department of the Interior, to encourage exploration for strategic and critical minerals. A new project was begun at the Copper Camp group, Valley County.

## REVIEW BY MINERAL COMMODITIES

### METALS

**Antimony.**—Sunshine Mining Co., Shoshone County, output of cathode metal (662 tons containing 96 percent antimony) was 8 percent below that of the previous year, but was slightly more than 1 percent higher in antimony content. Antimony contained in concentrate produced from ores of the Unit, Sunshine, Rambo, Suncon, and Yankee Girl properties was recovered by leaching and electrolysis. Cathode metal resulting from electrolysis was marketed to various smelters, secondary smelters, and brokers throughout the United States and Canada.

Smelter production of antimonial lead and high-purity antimony metal (99.99 to 99.999 percent Sb) by The Bunker Hill Co., Shoshone County, was interrupted by an extended strike in the Coeur d'Alene region. Because it is not identifiable by mine source, The Bunker Hill Co. output of antimony contained in antimonial lead is not included in State mineral-production totals.

**Beryllium.**—Exploration interest during the year centered about beryllium mineralization in the Idaho batholith. A Department of the Interior press release announced in August the discovery of widespread beryllium mineralization in the Sawtooth Mountains area of south-central Idaho (Elmore County) by field exploration teams of the Federal Bureau of Mines and the Idaho State Bureau of Mines and Geology. The discovery resulted from a lead provided by a local prospector, Kenneth Liddiard. In November, the two Bureaus announced a second discovery, this one in the Yellow Jacket Mountains (Lemhi County), 15 miles west of Cobalt and 80 miles north of the Sawtooth Mountains deposit. Although no deposits of economic

Digitized by Google

value were revealed by reconnaissance sampling of the two areas, the find indicated the possible existence of beryllium ore in commercial quantities. Further exploratory work was needed to ascertain the extent and importance of the discoveries.

Beryllium International, Inc., a Washington, D.C. company, acquired options on the 13 Sawtooth area discovery claims of Kenneth Liddiard; immediate investigation was scheduled to determine the extent of the occurrence.

**Cobalt.**—There was no production of cobalt in the State. In June, Calera Mining Co., a subsidiary of Howe Sound Co., abandoned interest in the Blackbird mine and mill at Cobalt, Lemhi County. Declining market prices brought Calera's cobalt production to a halt when the company's contract to deliver cobalt to the Government was completed in 1959. Domestic market demand for cobalt metal and oxide was being supplied principally by imports from Europe (Belgium-Luxembourg) and Africa (Republic of the Congo).

**Columbium-Tantalum.**—Columbium-tantalum dredging operations at Bear Valley, Valley County, were not resumed by Porter Bros. Corp. of Boise after completion in 1959 of the company contract with the Government. Research was conducted under a cooperative agreement between the Porter company and the Federal Bureau of Mines (Albany, Oreg.) to develop a commercial process for treating the euxenite (columbium-tantalum-bearing mineral) concentrate. Should the research prove successful in developing an economical process, it was anticipated by the company that both the two-boat dredging operation and the concentration plant at Lowman again would become active. Porter Bros. Corp., from 1955 through 1959, extracted a total of 130,521 tons of black-sand concentrate from its Bear Valley claims. Sizable tonnages of stockpiled byproduct ilmenite, monazite, and magnetite remained at the company plant at Lowman and warehouse at Boise.

**Copper.**—Output of copper was 4,208 tons, a sharp decline (52 percent) from the 8,713 tons produced in 1959. Calera Mining Co. milled stockpiled ore at Cobalt, Lemhi County, before quitting the Blackbird mine and mill operation in June; gold and silver also were recovered. The Blackbird mine was in previous years the leading copper producer in the State, the metal resulting as a byproduct of cobalt mining. Extended production stoppages at mines in the Coeur d'Alene region owing to a labor dispute reduced the quantity of copper produced in that area; output at the Sunshine mine was unaffected.

**Gold.**—Closure of the largest gold-producing operation, the Calera Mining Co. Blackbird mine, resulted in a 41-percent decline to 6,135 ounces, compared with 10,479 ounces in 1959. Also contributing to the decline was the curtailment, because of a prolonged strike, of the lesser quantities normally recovered from northern Idaho base-metal mines. In contrast with the State trend, the Lucky Friday Silver-Lead Mines Co. Lucky Friday mine, unaffected by the strike showed a 149-percent increase over the previous year and accounted for 24 percent of the State total.

Research was conducted under a cooperative agreement between the Porter company and the Federal Bureau of Mines (Albany, Oreg.) to develop a commercial process for treating the euxenite (columbium-tantalum-bearing mineral) concentrate. Should the research prove successful in developing an economical process, it was anticipated by the company that both the two-boat dredging operation and the concentration plant at Lowman again would become active. Porter Bros. Corp., from 1955 through 1959, extracted a total of 130,521 tons of black-sand concentrate from its Bear Valley claims. Sizable tonnages of stockpiled byproduct ilmenite, monazite, and magnetite remained at the company plant at Lowman and warehouse at Boise.

**Copper.**—Output of copper was 4,208 tons, a sharp decline (52 percent) from the 8,713 tons produced in 1959. Calera Mining Co. milled stockpiled ore at Cobalt, Lemhi County, before quitting the Blackbird mine and mill operation in June; gold and silver also were recovered. The Blackbird mine was in previous years the leading copper producer in the State, the metal resulting as a byproduct of cobalt mining. Extended production stoppages at mines in the Coeur d'Alene region owing to a labor dispute reduced the quantity of copper produced in that area; output at the Sunshine mine was unaffected.

**Gold.**—Closure of the largest gold-producing operation, the Calera Mining Co. Blackbird mine, resulted in a 41-percent decline to 6,135 ounces, compared with 10,479 ounces in 1959. Also contributing to the decline was the curtailment, because of a prolonged strike, of the lesser quantities normally recovered from northern Idaho base-metal mines. In contrast with the State trend, the Lucky Friday Silver-Lead Mines Co. Lucky Friday mine, unaffected by the strike showed a 149-percent increase over the previous year and accounted for 24 percent of the State total.

| 1959 | 10 | 92 | 1,878 | 14 | 5 | 89 | 24 | 98 | 1,967 |
| 1960 | [1] 9 | 64 | 793 | 11 | 6 | 50 | 20 | 70 | 843 |

[1] Includes 4 dragline dredges and 5 hydraulic operations; combined to avoid disclosing individual company confidential data.

**Iron Ore.**—Shipments of iron ore increased 63 percent, rising to 8,967 long tons from 5,501 long tons in 1959. Production went to cement plants and to several steel plants in Oregon and Washington. Two new producers—one each in Washington and Benewah Counties—accounted for the increase.

**Lead.**—Output of lead dipped 31 percent to 42,907 tons (the lowest since 1895), compared with 62,395 tons in 1959; the drop resulted from nearly complete stoppage of major mining and ore processing in the Coeur d'Alene region because of labor disputes at operations of the

[1] Less than $500.
[2] Includes values and quantities that cannot be shown separately for Ada, Adams, Blaine, Clark, Elmore, Idaho, Jerome, and Owyhee Counties.
[3] Because of rounding, individual items may not add to total shown.

American Smelting and Refining Co. and The Bunker Hill Co. The northern-Idaho lead-producing area yielded little metal from May through December because of a work stoppage called by the International Union of Mine, Mill and Smelter Workers, after failure of the union and the affected mining companies to reach a new contract agreement on issues of wages, fringe benefits, and management responsibilities. The mining community of Kellogg and the surrounding area suffered severe economic paralysis from an approximate $1 million-a-month salary loss for more than 7 months of the year. A sizable increase (48 percent) in output over the previous year at the Lucky Friday Silver-Lead Mines Co.'s Lucky Friday mine (operated by Hecla Mining Co.) and lesser production increases at the Sunshine Mining Co. Sunshine group and The Bunker Hill Co.'s Star mine (operated by Hecla Mining Co.) helped to alleviate the impact of the strike-caused production losses. Through a National Labor Relations Board supervised election in December, Bunker Hill Co. employees chose a new bargaining agent, and the company negotiated a 5-year settlement with the new union; a contract between American Smelting

| Zinc: Old slag smelted | 1 | 13,107 | -------- | 7,869 | 37,300 | 572,300 | 2,711,700 |
| Total "lode" material | 79 | 1,105,306 | 5,292 | 13,646,416 | 8,416,000 | 85,814,000 | 73,602,000 |
| Gravel (placer operations) | 20 | [3] | 843 | 92 | ---------- | ---------- | ---------- |
| Total | 99 | 1,105,306 | 6,135 | 13,646,508 | 8,416,000 | 85,814,000 | 73,602,000 |

[1] Because some mines produce more than one class of material, detail will not necessarily add to total shown.
[2] Combined to avoid disclosing individual company confidential data.
[3] 69,616 cubic yards.

**TABLE 11.—Mine production of gold, silver, copper, lead, and zinc in 1960, by types of material processed and methods of recovery, in terms of recoverable metals**

| Type of material processed and method of recovery | Gold (troy ounces) | Silver (troy ounces) | Copper (pounds) | Lead (pounds) | Zinc (pounds) |
|---|---|---|---|---|---|
| Lode: | | | | | |
| Amalgamation | 714 | 439 | ---------- | ---------- | ---------- |
| Concentration and smelting of concentrates: | | | | | |
| Ore | 4,102 | 13,596,045 | 8,024,400 | 84,966,500 | 70,855,100 |
| Direct smelting: | | | | | |
| Ore and assay rejects [1] | 476 | 42,063 | 354,300 | 275,200 | 35,200 |
| Old slag | ---------- | 7,869 | 37,300 | 572,300 | 2,711,700 |
| Total | 476 | 49,932 | 391,600 | 847,500 | 2,746,900 |
| Placer | 843 | 92 | ---------- | ---------- | ---------- |
| Grand total | 6,135 | 13,646,508 | 8,416,000 | 85,814,000 | 73,602,000 |

[1] Combined to avoid disclosing individual company confidential data.

and Refining Co. and the Mine-Mill union was signed shortly after the Bunker Hill election.

The outlook for the Coeur d'Alene area improved during the year when The Bunker Hill Co. entered into a long-term agreement with National Lead Co. for the purchase of all Bunker Hill metal production; the contract was to become effective January 1, 1961, and, along with the new labor-management agreement, was expected to bring Bunker Hill Kellogg operations to maximum production capacity.

Digitized by Google

**Mercury.**—State mercury output declined 22 percent to 1,538 flasks (76 pounds each) from 1,961 flasks in 1959. This was the lowest production since 1955, when output was 1,107 flasks. Production at the Idaho-Almaden mine (Rare Metals Corporation of America) near Weiser was 11 percent less than in 1959, and the Holley Minerals Corp. operation, also near Weiser, was idle. Ore treated yielded 2.1 pounds of mercury a ton, compared with 2.6 pounds in the previous year. Value of production dropped 27 percent below 1959, based on an average price of $210.76 a flask.

**Nickel.**—Upon closure of the Calera Mining Co. Blackbird mine, Lemhi County, nickel production in Idaho ceased. Mine output of the metal halted in June 1959 with the fulfillment of commitments for cobalt (associated in the ore with the nickel) under Government contracts.

**Rare-Earth Metals.**—There was no production of the rare-earth-bearing minerals (monazite and euxenite) in Idaho during the year. The Porter Bros. Corp. dredging operation was shut down (see Columbium-Tantalum), and no shipments of monazite resulted from reprocessing of stockpiled concentrate at the J. R. Simplot Co. Boise sand plant (see Titanium).

**Silver.**—Because of the work stoppage occasioned by the northern-Idaho labor dispute, silver output declined to 13.6 million ounces, a drop of 18 percent from 1959. The Sunshine group and Lucky Friday mines, unaffected by the strike, were the leading producers and accounted for 64 percent of the State total.

**Thorium.**—There were no commercial shipments of thorium-bearing ore or concentrate during the year. The location of new thorite mining claims in the Salmon area of Lemhi County subsided, and there was limited activity by several companies, one of which (Nuclear Fuels & Rare Metals Corp.) was redesigning a mill owned by Salmon River Uranium Development Corp. The mill, near North Fork, was to be used by Nuclear Fuels to beneficiate ore from a property near Tendoy. In the Lemhi Pass area, Rare Metals Corporation of America explored properties leased in 1959 from Agency Creek Thorium & Rare Metals Corp.

**Titanium.**—Stockpiled ilmenite dredge concentrate was reprocessed at the J. R. Simplot Co. Boise plant to produce 2,032 tons of ilmenite for high-density concrete and roofing granules.

**Tungsten.**—Small-scale mining and milling were resumed late in the year by Salmon River Scheelite Corp. at the Tungsten Jim mine on Thompson Creek near Clayton, and exploratory work was continued. No tungsten concentrate was shipped.

**Uranium.**—Owing to an increase in grade of ore, the value of uranium production increased despite a decrease in ore shipments. Two producers shipped—The Childs Co. (Lightning group) and Phillips Petroleum Co. (Elk No. 1 Deerstrike)—from mines in Custer County.

**Vanadium.**—Minerals Engineering Co. and Susquehanna-Western, Inc., a subsidiary of The Susquehanna Corp., organized a joint venture for recovery of vanadium contained in Idaho phosphate rock. The new company, named Susquehanna Minerals, purchased the former Calera Mining Co. cobalt refinery in Salt Lake City, Utah, where high-purity vanadium oxide was to be produced at the rate of 1.5

Digitized by Google

million pounds annually. A two-stage process developed by Minerals Engineering Co. and Food Machinery & Chemical Corp. was planned—the first step would be carried out at Pocatello and the second, a refining step, would take place at the Salt Lake City plant, for which $500,000 in new facilities was authorized.

**Zinc.**—Because of the strike in the Coeur d'Alene region, production of zinc dropped to 36,801 tons—a 34-percent decline compared with 1959 and the lowest output since 1935. The Bunker Hill Co. Star mine, Shoshone County, operated the entire year by Hecla Mining Co., was by far the leading producer; concentrates formerly going to the Bunker Hill smelter were stockpiled.

## NONMETALS

**Barite.**—The Sun Valley barite mine of J. R. Simplot Co., Blaine County, was idle throughout the year; however, shipments were made from stocks to the company grinding plant in Power County, west of Pocatello. Shipments of ground barite, marketed principally as a weighting agent for oil-well drilling muds, were reduced sharply compared with 1959.

**Cement.**—Idaho Portland Cement Co. continued production of portland and masonry cements at Inkom, Bannock County. Production and shipments were 6 percent lower than in 1959. Cement was shipped mainly to destinations within the State; smaller quantities were shipped to other markets in the Rocky Mountain area.

**Clays.**—The quantity of clay sold or used by Idaho producers increased 6 percent over 1959. Greater production of fire clay accounted for the advance. Miscellaneous clay used in making heavy clay products, mainly building brick, was produced in Bonneville, Cassia, Elmore, and Minidoka Counties. Fire clay for refractories was mined in Latah County.

A small tonnage of bentonite mined near Grandview, Owyhee County, was marketed as a hydroseal for irrigation canals and reservoirs and for use in oil-well drilling muds.

J. R. Simplot Co. completed construction in February of a $1.5 million clay-beneficiation plant at Bovill, Latah County. The installation was built to produce mixtures of clay, quartz, and mica suitable for use as paper clay and glass sand. The sand section of the plant began operating in February; the clay section began test operations in October.

**Garnet (Abrasive).**—Production and shipments of abrasive garnet by Idaho producers were down sharply from the previous year. Shipments were made from operations in Benewah, Ada, and Boise Counties. Output by Porter Bros. Corp. (Boise County) and J. R. Simplot Co. (Ada County) was a byproduct of milling sand concentrates previously dredged at the companies' operations in Valley County.

**Gypsum.**—No production of gypsum was reported from the Rock Creek gypsum mine in Washington County; however, shipments from stocks were made during the year. Less gypsum was marketed for agricultural purposes than in 1959.

Digitized by Google

**Mica.**—Test lots of hand-cobbed mica were shipped to the General Services Administration (GSA) mica-purchase depot at Custer, S. Dak., from prospects near Riggins, Idaho County, and Murphy, Owyhee County. In July, controlling interest in Western Mica Corp., Deary, Latah County (Muscovite mine), was purchased by Ida-Mica Industrial Minerals, Inc. No production of mica was reported from the Muscovite mine in 1960.

**Peat.**—Peat production advanced more than twofold compared with 1959; however, tonnages remained relatively small. Reed-sedge peat, produced at bogs in Bannock and Teton Counties, was marketed mainly for soil-conditioning uses.

**Perlite.**—Oneida Perlite Corp. began developing a newly discovered perlite deposit northwest of Malad, Oneida County. The company constructed an expanding plant at Malad that was to process crushed ore shipped from the mine about 25 miles away. The largest use of the expanded perlite was expected to be in building plaster.

**Phosphate Rock.**—Production of marketable phosphate rock by Idaho producers increased to 2.2 million long tons, compared with 1.6 million long tons in the previous year. Mine production of phosphate rock advanced 3 percent over the 2.2 million long tons mined in 1959. Phosphate rock was produced from six operations in 1960—three in Caribou County, two in Bear Lake County, and one in Bingham County. In addition, shipments were made from stocks at a mine in Caribou County. San Francisco Chemical Co. began production in May from the newly opened Diamond Gulch property north of Montpelier (Caribou County). Output from the mine was trucked to the company mill at Montpelier for grinding before shipment to fertilizer-manufacturing plants in the western United States.

Phosphate rock sold or used by producers was 2 million long tons, an increase of 25 percent over the 1.6 million long tons sold or used in 1959. The largest use continued to be for manufacturing elemental phosphorus; the quantity of rock consumed for this purpose remained substantially the same as in 1959. The quantity of rock used to manufacture phosphate fertilizers and wet-process phosphoric acid and that shipped for export increased over 1959.

Phosphate rock was utilized at elemental phosphorous plants of Food Machinery & Chemical Corp., Mineral Products Division, Pocatello; Monsanto Chemical Co., Soda Springs; and Central Farmers Fertilizer Co., Georgetown. The Central Farmers firm used elemental phosphorus to make phosphoric acid, which in turn was used to produce phosphate fertilizers at the company Georgetown plant. J.R. Simplot Co. continued producing phosphate fertilizers at a plant west of Pocatello in Power County. San Francisco Chemical Co. operated a grinding and pulverizing plant at Montpelier, Bear Lake County.

In June, The Bunker Hill Co. completed construction of a $2 million plant at Kellogg, Shoshone County, which was to produce phosphoric acid for fertilizer use. The company was developing phosphate-rock deposits in Montana as a source of raw material for this plant; however, phosphate rock from Idaho and Wyoming was to be used initially. Sulfuric acid used in the process would be supplied from the nearby company acid plant. The new facility remained idle

Digitized by Google

throughout the year because of a labor dispute that halted all Bunker Hill operations in the Kellogg area. In September, Collier Carbon & Chemical Corp. began constructing a $225,000 acid-concentrating plant adjacent to the Bunker Hill phosphoric acid facility. The addition, owned by the Collier concern, would be used by Bunker Hill to manufacture highly concentrated phosphoric acid which would be shipped to Collier company fertilizer plants in California.

J. R. Simplot Co. in July announced that productive capacity at its Pocatello fertilizer plant would be doubled. Included in the proposed expansion program was an ammonium phosphate plant to manufacture complex fertilizers containing nitrogen and phosphorus. Also, additional dust- and fume-collecting equipment was to be installed. The expansion was scheduled for completion in 1961.

Food Machinery & Chemical Corp., Mineral Products Division, began a $2.5-million modernization program that would boost productive capacity at the Pocatello elemental-phosphorus plant.

**Pumice and Volcanic Cinder.**—Pumice and volcanic cinder sold or used by producers declined sharply compared with 1959. Output was from operations in Bonneville, Canyon, and Twin Falls Counties. Three pumice operations in Bonneville County continued to supply the major portion of the output. Pumice and volcanic cinder were used chiefly as lightweight-concrete aggregate. A quantity of crude pumice was used as feedlot fill and for surfacing roads. Boise Cascade Concrete, a subsidiary of Boise Cascade Corp., optioned 260 acres of pumice claims near Fairfield, Camas County, for the purpose of testing the extent and quality of the deposits. The firm considered establishing a plant at the deposits to manufacture lightweight-concrete products.

**Sand and Gravel.**—Sand and gravel output was 7.1 million tons—a decline of 23 percent from the 9.2 million tons produced in 1959. The drop was caused by decreased use of sand and gravel at State highway department and U.S. Forest Service projects. The quantity of sand and gravel used at State highway projects (3.1 million tons) was 38 percent less than for the previous year. Sand and gravel produced by commercial firms was 2.5 million tons, compared with 2.1 million tons for 1959. Noncommercial (Government-and-contractor) output was 4.6 million tons—a decline of 35 percent from the 7.1 million tons produced the previous year. Production was from operations in 36 of the 44 counties in the State. Cassia County ranked as the largest producing area; Bonneville and Owyhee Counties ranked second and third, respectively.

Industrial sands were produced at two operations—one each in Gem and Latah Counties. Special high-quality sands for glass, filter, plaster, and foundry purposes were produced.

**Stone.**—Total production of stone for all purposes advanced 22 percent over 1959. Output by commercial producers increased 43 percent from the previous year and was the principal cause of the rise. Increased use of roadstone at State and Federal projects also contributed to the advance. Noncommercial (Government-and-contractor) tonnages were 6 percent greater than in 1959. In terms of tonnage, basalt continued to be the principal stone quarried. Output was used chiefly for road construction and maintenance; smaller quantities were used

| Total | 7,082 | 5,862 | 4,602 | 3,977 |
| All operations: | | | | |
| Building | 722 | 909 | 851 | 1,198 |
| Road material | 8,243 | 6,997 | 5,747 | 5,057 |
| Railroad ballast | (1) | (1) | (1) | (1) |
| Other | 219 | 174 | 490 | 339 |
| Grand total [2] | 9,184 | 8,080 | 7,088 | 6,594 |

[1] Included with "Other" to avoid disclosing individual company confidential data.
[2] Because of rounding, individual items may not add to totals shown.

for ballast and riprap. The quantity of limestone quarried decreased 15 percent from the previous year. Output, which was from quarries in Bannock and Lewis Counties, was used mainly for cement manufacture. Other uses included sugar refining, metallurgical flux, paper manufacturing, and agricultural applications. Quartzite used as flux in electric furnaces of elemental-phosphorus plants was quarried in Caribou and Power Counties. The quantity produced for this use increased moderately over 1959. Stone production was reported from 17 of the State's 44 counties.

**Sulfuric Acid.**—The Bunker Hill Co. continued production of sulfuric acid at Kellogg, Shoshone County, until May, when a labor dispute idled all Bunker Hill operations in the Kellogg area. Output, which normally was used partly for manufacturing fertilizers and partly at the company metallurgical works, was drastically reduced from the previous year. J. R. Simplot Co. continued to produce sulfuric acid at a plant west of Pocatello in Power County for use in an adjacent company fertilizer plant to manufacture phosphate fertilizers and wet-process phosphoric acid.

## REVIEW BY COUNTIES

**Ada.**—Remaining stocks of ilmenite derived from earlier dredging in Valley County by Baumhoff-Marshall, Inc., were sold by J. R. Simplot Co., Boise.

Sand and gravel for construction and road use was produced in the county; however, output was down sharply from 1959 because of curtailed requirements for road gravel at State highway department projects. A quantity of crushed stone was produced for use at U.S. Army Corps of Engineers works.

Digitized by Google

**Adams.**—The South Peacock mine at Helena, 10 miles north of Cuprum in the Seven Devils district, was operated by Todd Russell and Jack Darling. Copper ore was hand sorted and shipped to the Tacoma, Wash., smelter.

**Bannock.**—Portland and masonry cements were produced at the Inkom plant of Idaho Portland Cement Co. Limestone for use at the plant was obtained from a nearby quarry. Peat was produced at about the 1959 rate from a bog near Downey. Sand and gravel production declined sharply because of reduced demand by State and county highway departments. Crushed stone output advanced compared with 1959 owing to increased use of basalt at State highway department projects.

**TABLE 13.—Value of mineral production in Idaho, by counties**

(Thousand dollars)

| County | 1959 | 1960 | Minerals produced in 1960, in order of value |
|---|---|---|---|
| Ada | $613 | (1) | Sand and gravel, stone, silver, gold. |
| Adams | 22 | (1) | Copper, silver, gold. |
| Bannock | (1) | (1) | Cement, stone, sand and gravel, peat. |
| Bear Lake | (1) | (1) | Phosphate rock, sand and gravel, stone. |
| Benewah | (1) | $212 | Sand and gravel, abrasive garnet, stone, iron ore. |
| Bingham | (1) | (1) | Phosphate rock, sand and gravel. |
| Blaine | 257 | (1) | Barite, silver, lead, zinc, gold. |
| Boise | 2 | 35 | Stone, gold, silver. |
| Bonner | 101 | 107 | Sand and gravel, silver, lead, gold. |
| Bonneville | 534 | 462 | Sand and gravel, pumice, and clays. |
| Boundary | 171 | 99 | Sand and gravel, stone, lead, silver. |
| Butte | 14 | (1) | Lead, gold, silver. |
| Camas | ---------- | 80 | Sand and gravel. |
| Canyon | 263 | 232 | Sand and gravel, pumice. |
| Caribou | (1) | (1) | Phosphate rock, stone, sand and gravel. |
| Cassia | 598 | 957 | Sand and gravel, clays. |
| Clark | 79 | 36 | Sand and gravel, copper, silver, gold. |
| Clearwater | (1) | 188 | Sand and gravel, stone, gold, silver. |
| Custer | 436 | 549 | Lead, silver, copper, uranium, zinc, gold. |
| Elmore | 520 | 196 | Sand and gravel, stone, clays, gold, silver. |
| Franklin | 152 | 112 | Sand and gravel, stone. |
| Fremont | (1) | 27 | Sand and gravel. |
| Gem | 12 | 214 | Sand and gravel, gold, silver, lead, zinc, copper. |
| Gooding | 201 | (1) | Sand and gravel. |
| Idaho | 395 | 419 | Stone, sand and gravel, gold, silver, mica. |
| Jefferson | 312 | ---------- | |
| Jerome | 8 | 204 | Sand and gravel, gold, silver. |
| Kootenai | 574 | 300 | Sand and gravel. |
| Latah | (1) | 153 | Stone, sand and gravel, clays. |
| Lemhi | 4,449 | 1,002 | Copper, gold, sand and gravel, lead, silver, zinc. |
| Lewis | (1) | 297 | Stone. |
| Lincoln | 33 | (1) | Sand and gravel. |
| Madison | 160 | (1) | Do. |
| Minidoka | 70 | 171 | Sand and gravel, clays, stone. |
| Nez Perce | 26 | 21 | Sand and gravel. |
| Oneida | 4 | 45 | Do. |
| Owyhee | 41 | 348 | Sand and gravel, stone, clays, gold, mica. |
| Payette | 106 | 37 | Sand and gravel. |
| Power | 1,880 | 272 | Sand and gravel, stone. |
| Shoshone | 44,341 | 33,393 | Silver, lead, zinc, copper, antimony, gold, stone. |
| Teton | 98 | (1) | Sand and gravel, peat. |
| Twin Falls | 356 | 267 | Sand and gravel, pumice. |
| Valley | 641 | 35 | Titanium (ilmenite), abrasive garnet, sand and gravel, gold, silver. |
| Washington | 484 | 840 | Sand and gravel, mercury, iron ore. |
| Undistributed [2] | 12,256 | 16,131 | |
| Total | 70,209 | 57,441 | |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."

[2] Includes value of some sand and gravel, stone, and gem stones that cannot be assigned to specific counties and values indicated by footnote 1. Excludes value of raw materials used in manufacturing cement.

Digitized by Google

**Bear Lake.**—Mine production of phosphate rock was lower than in 1959 because of reduced output at the Central Farmers Fertilizer Co. Georgetown mine. Production was used by the firm to produce elemental phosphorus, phosphate fertilizers, phosphoric acid, and a beneficiated phosphate-rock product. A quantity of rock also was shipped for export. San Francisco Chemical Co. mined and shipped phosphate rock from the Waterloo mine early in the year; shipments were made from stocks at the mine during the last half of the year. Increased requirements for sand and gravel at State highway department projects resulted in a sharp production rise over the previous year.

**Benewah.**—Iron ore was mined near Tensed by C. C. Hill from an open-pit operation; ore was sold for use at a cement plant in Washington.

**Bingham.**—J. R. Simplot Co. continued mining phosphate rock at the Gay mine near Fort Hall. Production of both phosphate rock and phosphatic shale increased compared with 1959. Phosphate rock was shipped to the Simplot fertilizer works west of Pocatello in Power County. Phosphatic-shale production was utilized at the elemental-phosphorous plant of Food Machinery & Chemical Corp. at Pocatello.

**Blaine.**—Lead ore was mined and shipped from the six-claim La Grande group northwest of Hailey in the Mineral Hill district. In the same district, the Shelton Cheney Mining Co. Liberty Gem mine and the Star mine operated by Thornley Williams yielded silver ore. Exploration and development were conducted by Silver Star Queens Mines, Inc., at the Minnie Moore lead mine near Hailey.

The J. R. Simplot Co. Sun Valley barite mine was not operated in 1960; however, shipments of crude barite were made from stock to the company grinding plant at Pocatello. The quantity of crude barite shipped for grinding was down sharply compared with the previous year.

**Boise.**—Seven placer operations in the Boise Basin district yielded 185 ounces of gold and 41 ounces of silver from 22,324 cubic yards of stream and bench gravel and old tailings. A dragline dredge used on old tailings at the Pennington mine was the principal operation. Six small lode-gold mines were active, including the Gold Belt and Gold Hill properties in the Boise Basin district and the Golden Cycle and King mines in the Summit Flat mining district.

**Bonner.**—Small quantities of lead and silver ore were mined at four properties; a fifth mine, the Austin Meyer Corp. Weber mine, Lakeview district, yielded a comparatively large tonnage of lead ore. Selkirk Mining Co. announced plans to construct a 750-foot tramway at the Plowboy mine (lead ore), Kootenai mining district, to be used to carry ore from the mine to a stockpile area, from which the ore was to be trucked to a smelter. The Conjecture mine, north of Lake Pend Oreille, was under development by Conjecture Mines, Inc.

**Bonneville.**—Three operations in the county continued to supply the bulk of the pumice produced in the State. Output, which was marketed for use as lightweight-concrete aggregate, was less than in 1959. Sand and gravel production remained substantially the same as for the previous year.

Digitized by Google

**Butte.**—Minor tonnages of lead and gold-silver ores were produced from three mines in the Dome district.

**Caribou.**—Mine production of phosphate rock increased sharply over 1959. Greater production from the Conda mine (J. R. Simplot Co.) was the principal reason for the advance. Production from the new Diamond Gulch operation of San Francisco Chemical Co. and increased output from the Ballard properties of Monsanto Chemical Co. also contributed. J. R. Simplot Co. shipped phosphate rock from the Conda mine for fertilizer manufacture and for export; the Ballard mine continued to supply phosphate rock used at Monsanto's elemental-phosphorus plant at Soda Springs. Output from San Francisco Chemical Co. Diamond Gulch mine was ground at the company Montpelier mill. Phosphate rock for fertilizer manufacture was shipped from stockpiles at the J. A. Terteling operation during the year.

**Clark.**—Copper ore was mined from the Valley View mine, Birch Creek district.

**Clearwater.**—A dragline dredge was utilized by Moose Mountain Mining Co. on the Lilly No. 1 and No. 2 claims to recover 67 ounces of gold and 11 ounces of silver from 5,000 yards of stream gravel.

**Custer.**—Custer county ranked third in the State in the value of gold, silver, copper, lead, and zinc produced; Clayton Silver Mines (Clayton mine) was the principal producer, accounting for 93 percent of the tonnage of these ores mined in the county. Exploration and development at the Clayton mine, 2 miles north of Clayton in the Bayhorse district, consisted of 228 feet of raising, 1,034 feet of drifting, and 432 feet of crosscutting; mining was by the shrinkage stope method. The Clayton mill zinc circuit was idle because of low market prices, and some lead ore was bypassed in the mine for the same reason. The mine and mill were operated 6 and 7 days a week, respectively, for the entire year. The Clayton Silver Mines' annual report to shareholders stated in part:

> The North Drift, on the 800 level, was completed after advancing 760 feet to a point some 1,900 feet north of the shaft. The downward extension of the 500 north ore body was found approximately as planned at 1,400 feet north of the shaft. The drift was advanced on very good lead-zinc-silver ore for 140 feet. In the next 300 feet some lead and practically no zinc was found, but the silver content rose sharply. The occurrence of tetrahedrite which carried the silver in this latter area is rather erratic but the total content over a 40-foot width is considerable. By the end of the year not enough information had been gained to definitely establish grade and tonnage, but it looks as though there are over 225,000 tons with a probable content value of around $8.00 a ton at the present prices of lead and silver. The tonnage of lead-zinc-silver ore mentioned above in the first 140 feet between the 500 and 800 is estimated at 108,700 tons.
>
> The 500 North Drift was advanced 275 feet and a crosscut was driven 173 feet eastward to explore the east wall. Some mineralization but no ore was found.
>
> The reserves of broken ore in the south 700 and north 500 stopes were estimated at 4,000 tons at year's end.
>
> The diamond drilling contemplated during 1960 was deferred until 1961 from fear of increasing the mine water flow which had been near the pump's capacities.
>
> The major projects for 1961 will be development of the 800 north end ore body and diamond drilling.

In the Alder Creek district, the Empire group produced copper ore. It was the only other significant producer of base metal ores in the county. The White Knob lead mine also was active. In addition to

Digitized by Google

the Clayton mine, other mines producing in the Bayhorse district were the Ellis group (lead), Estes Gold (copper), and Red Top (lead-zinc) properties. The D & E mine (Sheep Mountain district) yielded lead-zinc ore and the Charles Dickens (silver) and Lucky Day (gold) mines produced in the Yankee Fork district.

The Grubstake mine (Seafoam district), the only active placer, yielded several ounces of gold from stream gravel.

Sidney Mining Co. conducted a diamond-drilling program in the Bayhorse district under an agreement with Umont Mining, Inc., which held a lease option from Bayhorse Mines, Inc.; the Bayhorse firm held the Ramshorn group containing 19 patented and 4 unpatented claims. Exploration was concentrated in the Beardsley Gulch area.

The Childs Co. and Phillips Petroleum Co. operated uranium properties and accounted for the total State production of uranium ore.

There was production but no shipment of tungsten concentrate at the Salmon River Scheelite Corp. Tungsten Jim mine near Clayton.

**Elmore.**—Talache Mines, Inc., mined gold ore from the Boise-Rochester group in the Middle Boise district; the Golden Stringer gold mine also was active in the district. Two placer operations produced in the Bear Creek district—dragline dredge at the Feathers placer on stream gravel and a small-scale hand operation on bench gravel.

**Gem.**—Of the four gold and base metal mines that produced, the Dewey mine (gold) near Emmett yielded the largest ore tonnage in the county. Other properties, all in the Westview mining district, were the Black Rock (gold-silver and lead-zinc), Checkmate (gold-silver from old tailings), and Eagle Talon (gold-silver). A new 40-ton jig-flotation mill was in operation at the Gem State Consolidated Mines, Inc., Dewey group mine. Gold sponge derived from sulfide ores was shipped to the Denver Mint, and concentrate went to the East Helena, Mont., smelter. The Gem State company, operating from March through December, did 400 feet of exploration-and-development raising, drifting, and crosscutting and 125 feet of long-hole drilling; 11,375 tons of development rock was mined to dump. The ore was mined by using stulled stopes.

**Idaho.**—Two placers using hydraulic methods and two small-scale hand placer operations were active. The Gold Bar placer, operated by Del Dewey in the Mt. Marshall district, was the principal producer. Idaho Mining & Milling Co. was readying a dredge to be used for recovering gold in the Florence Basin.

Kimberly Gold Mines, Inc., produced gold ore from the Kimberly group, Marshall Lake district, and blocked out enough ore to operate a 100-ton flotation mill near Riggins for 2 years. Two other gold properties—Gauntlet (Florence district) and Center Star (Ten Mile district)—produced lesser quantities of ore.

A test-lot shipment of hand-cobbed mica was made to GSA from the Mica lode and Lake Creek prospects east of Riggins.

**Latah.**—In February, J. R. Simplot Co. began operating the sand-separation section of a clay-sand beneficiation plant near Bovill. Output was shipped mainly for glass and foundry purposes. Fire clay produced near Helmer was used in manufacturing refractories at the Troy plant of A. P. Green Firebrick Co. The Muscovite mine

Digitized by Google

(mica) of Ida-Mica Industrial Minerals (formerly Western Mica Corp.) was idle throughout 1960. The mine in recent years had been a source of hand-cobbed mica which was shipped to the GSA for Government stockpiling. A quantity of crushed stone for road use also was produced.

**Lemhi.**—Lemhi County ranked second in the State in value of gold, silver, and base metals produced. Ore output came principally from the Calera Mining Co. Blackbird mine at Cobalt. Stockpiled ore was milled by the Calera company until operations ceased in June. Lesser quantities of gold, silver, copper, lead, and zinc ores were mined at 16 other lode properties; those yielding sizable tonnages were the Black Pine, Peacock, Golden Copper Queen, Twin Peaks group, United Idaho, and Yellowjacket mines. Hydraulic placering was carried out on the Leesburg-Tacoma placer near Salmon. Over 31,000 cubic yards of stream gravel yielded 194 ounces of gold.

The Agency Creek thorite claims near Salmon were examined by Rare Metals Corporation of America.

**Power.**—Phosphate rock was processed at two plants west of Pocatello. Phosphatic shale from the Gay mine, Bingham County, was utilized at the elemental-phosphorus plant of Food Machinery & Chemical Corp. J. R. Simplot Co. continued manufacturing phosphate fertilizers and wet-process phosphoric acid from rock produced at the company Gay mine, Bingham County, and Conda mine, Caribou County. The Simplot firm announced plans for doubling productive capacity at the Pocatello fertilizer works. The expansion, which was to include facilities for manufacturing ammonium phosphate fertilizer, was the second the company had announced in as many years. In 1959, the company completed installing additional grinding, filtering, and evaporating equipment and constructing a sulfuric acid plant as part of an expansion program begun in 1958. Quartzite quarried near Pocatello was utilized as flux in electric-furnace manufacture of elemental phosphorus. Sand and gravel production was reduced sharply compared with 1959 because of curtailed requirements at State highway department projects in the county.

**Shoshone.**—The value of gold, silver, copper, lead, and zinc production in Shoshone County declined 25 percent from 1959; of the five metals, silver ranked first, followed, in order of value, by lead, zinc, copper, and gold. Although value of the other four commodities dropped, that of gold increased 10 percent over the previous year. County production of these metals accounted for 95 percent of the State output.

Lead and zinc showed the lowest production since 1896 and 1938, respectively, because of an extended labor strike at major mining and milling operations in the county. The International Union of Mine, Mill and Smelter Workers called strikes at The Bunker Hill Co. and American Smelting and Refining Co. operations, resulting in unemployment for approximately 2,500 employees for over 7 months. The walkouts came after many monthly contract extensions following expiration of work agreements in 1959. American Smelting and Refining Co. mines (Page and Galena) were closed from May 25 to December 17 before settlement was reached with the Mine-Mill union. The Bunker Hill Co. employees moved to decertify the Mine-Mill

Digitized by Google

**TABLE 14.—Mine production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region, Shoshone County, in terms of recoverable metals**

| Year | Mines producing | | Material sold or treated (thousand short tons) | Gold, lode and placer (troy ounces) | Silver, lode and placer (thousand troy ounces) |
|---|---|---|---|---|---|
| | Lode | Placer | | | |
| 1951–55 (average) | 49 | -------- | 1,955 | 2,272 | 13,782 |
| 1956 | 36 | 2 | 1,675 | 1,963 | 12,663 |
| 1957 | 31 | -------- | 1,701 | 2,254 | 14,398 |
| 1958 | 25 | -------- | 1,337 | 2,363 | 15,615 |
| 1959 | 17 | 1 | 1,422 | 2,349 | 16,461 |
| 1960 | 22 | 1 | 980 | 2,591 | 13,459 |
| 1884–1960 | -------- | -------- | (1) | 428,000 | 617,830 |

| Year | Copper (short tons) | Lead (short tons) | Zinc (short tons) | Total value (thousands) |
|---|---|---|---|---|
| 1951–55 (average) | 2,208 | 66,483 | 64,644 | $52,160 |
| 1956 | 2,889 | 60,221 | 46,738 | 45,701 |
| 1957 | 3,473 | 67,125 | 54,825 | 47,117 |
| 1958 | 3,884 | 52,488 | 49,532 | 38,645 |
| 1959 | 3,678 | 61,155 | 55,454 | 44,058 |
| 1960 | 2,606 | 41,692 | 36,639 | 33,153 |
| 1884–1960 | 99,000 | 6,472,000 | 2,087,000 | 1,819,052 |

[1] Complete data not available: 1904–1960, 105,071,000 short tons.

union as their representative and, after being on strike beginning May 5, the workers, through a National Labor Relations Board supervised election on December 10, voted in a new union (Northwest Metal Workers Union, independent).

According to The Bunker Hill Co. annual report to shareholders, the company lead smelter near Kellogg worked on a 6-day basis until the strike and all five electrolytic units were operated at the zinc plant. During the strike, research, field geology, and engineering projects were conducted. After considerable maintenance and repair, the smelter was ready to return to full production in December; however, only the zinc plant was in operation before the end of the year, producing small quantities of refined zinc and cadmium.

In June, The Bunker Hill Co. at Kellogg completed constructing a phosphoric acid plant which was begun in 1959. The plant remained idle throughout the year because of a labor dispute. In September, Collier Carbon & Chemical Corp. began erecting an acid concentrating plant adjacent to the Bunker Hill facility. The plant was to be used to concentrate standard-analysis phosphoric acid prior to shipment to Collier fertilizer plants in the West.

**Beaver District.**—The Day Mines, Inc., Goat mine (Monitor property), yielding zinc-lead-silver ore, was worked by lessees.

**Evolution District.**—Three silver properties produced—Rainbow property (Coeur d'Alene Mines Corp.), Silver Summit (Hecla Mining Co.), and Sunshine operating group (Sunshine Mining Co.). The Sunshine group was the principal producer, but output and average grade of ore milled was below 1959. Over 232,000 tons of ore, averaging 27.14 ounces of silver a ton, was mined. Ore from Sunshine properties was yielded mostly (93 percent) from the Unit mine

Digitized by Google

(214,926 tons), and the remainder was from the Sunshine, Rambo, Suncon, and Yankee Girl mines. The Sunshine company's annual report to shareholders stated the following:

**The extensive drifting, raising, and crosscutting on the 3400, 3550, 3700, and 4000 levels in connection with the new shaft development, has limited eastward exploration to drifting and diamond drilling in the Chester fault zone on the 4000 level and in the hanging wall of the Syndicate fault on the 3700 level. A total of 340 horizontal feet of new ore on those levels has been exposed with the vertical extent yet to be determined.**

**A sand-fill system has been installed whereby the tailings from the mill are pumped back into the mine to fill the voids in stopes created by removal of the ore, heretofore filled with waste rock from exploration and development. The economy of a sand-fill system is based upon the expectation that less timber will be needed and that there will be better control of grade so that less waste rock is extracted.**

Sunshine company mining costs increased due to general wage increases, but costs were below those experienced in 1956 and 1957. Ore reserves declined at all properties except the Unit mine, which showed a slight increase in available tonnage. Exploration and development by Sunshine Mining Co. totaled 8,034 feet of drifting, raising, crosscutting, and sinking; 62 diamond-drill holes yielded 10,717 feet of exploratory core.

*Hunter District.*—High-grade silver ore was mined and milled (133,724 tons) by Hecla Mining Co. at the Lucky Friday mine (1 mile east of Mullan) owned by Lucky Friday Silver Lead Mines Co. Ore, formerly milled at the Golconda Lead Mines concentrator, was diverted early in the year to a new 680-ton-a-day (maximum capacity) mill constructed at the mine; the company planned to expand mill capacity to 750 tons a day. Mill feed averaged 20 ounces of silver and nearly 11 percent lead.

The Morning mine (American Smelting and Refining Co.) and The Bunker Hill Co. Star mine (operated by Hecla Mining Co.) produced lead and zinc ore. A small ore tonnage was derived from the Morning mine as a result of closing operations. The Morning Mill was dismantled by Alaska Junk Co. of Spokane, Wash. The Bunker Hill Co. Star mine was unaffected by the regional labor strike because the property was operated by Hecla Mining Co., whose workers were represented by the nonstriking United Steel Workers of America. According to The Bunker Hill Co. annual report, the Star mine operated 5 days a week, with concentrate being stockpiled after May 5; yearend ore reserves were reported at 756,798 tons.

*Lelande District.*—The Hercules and Sherman mines of Day Mines, Inc., yielded lead ore. Hercules production was from stockpiled concentrates; the mine was closed in March, and the workings below the No. 5 adit were allowed to flood. Ore from the Sherman property was derived from cleanings.

*Placer Center District.*—The Dayrock, Galena, and Tamarack No. 5 mines were the principal producers in the district. According to the Day Mines, Inc., annual report, operation of the Dayrock mine was curtailed throughout the year to allow active development of the Hornet vein, an ore body that extended about 100 feet upward from the 1100-level drift. Operations at the Galena mine by American Smelting and Refining Co. were halted by the long strike. Only nomi-

Digitized by Google

nal development was carried out during the year on the Silver vein and the North vein. Drifting on the 2800 level of the North vein failed to disclose ore; limited work on the Silver vein indicated a comparatively small vein containing higher than average quantities of silver. The Day Mines' Tamarack property was mined (lead-zinc ore) on a small scale by a lessee. A small tonnage of copper ore was shipped from the Hansy mine.

*Smelter District.*—The Bunker Hill Co. fumed over 13,000 tons of zinc-dump slag that yielded 286 tons of lead and 1,356 tons of zinc.

*Yreka District.*—District output was predominantly from mines of The Bunker Hill Co.—Bunker Hill (lead-zinc ore) and Crescent (silver ore). The American Smelting and Refining Co. Page mine (lead-zinc ore) also was a significant producer. Sidney Mining Co. produced lead-zinc ores from the Nabob and Sidney properties. The Bunker Hill and Crescent mines operated on a 5-day basis until the strike; yearend ore reserves at these properties were 2,870,173 tons and 62,792 tons, respectively. Sidney Mining Co. halted mining activities in the Pine Creek area. An agreement between the Sidney company and Nabob Silver-Lead Co. for the operation of the Nabob mine was terminated, and production at the Sidney mine, from block leases, ceased in March.

**Valley.**—Dredging operations of Porter Bros. Corp. at Bear Valley were idle. No activity was reported at the Hermes mercury property (Holly Minerals Corp.).

**Washington.**—Iron ore was mined by George Budock at a property near Cambridge and by Glen Clark at the Mortimer mine near Weiser. Production was marketed at cement and steel plants in Oregon and Washington.

Rare Metals Corporation of America mined and furnaced mercury ore from the Idaho-Almaden property 16 miles east of Weiser. Over 55,000 tons of ore and nearly 44,000 tons of waste rock were moved at the open-pit operation. Exploration and development drilling totaled 14,440 feet.

The Rock Creek gypsum mine near Weiser was idle throughout the year; however, shipments from stock for agricultural purposes were made.

# The Mineral Industry of Illinois

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Illinois State Geological Survey.**

By Matthew G. Sikich [1]

VALUE of Illinois mineral output in 1960, greater than any prior year, was $590.8 million, a 3-percent increase over 1959, and 2 percent more than the $576.9-million record attained in 1958. Increases in production of clays, fluorspar, lead, lime, liquified petroleum gases, petroleum, sand and gravel, stone, tripoli, and zinc all contributed to the record output. Total quantities and values of output decreased in 1960 for portland and masonry cements, natural gas, natural gasoline, and peat. The total value of coal sold decreased, but output increased slightly. New highs in production of sand and gravel and stone were established.

Mineral fuels continued as the major commodity group, furnishing nearly 75 percent of the total value of mineral production. Nonmetals supplied 24 percent, and metals comprised the remainder.

Illinois produced a wide variety of mineral commodities. In 1960 the State led in fluorspar production, ranked fourth in bituminous coal output, and was among the leading States in producing minerals of construction—cement, clays, lime, sand and gravel, and stone. Illinois also ranked high as a center for processing mineral raw materials.

---

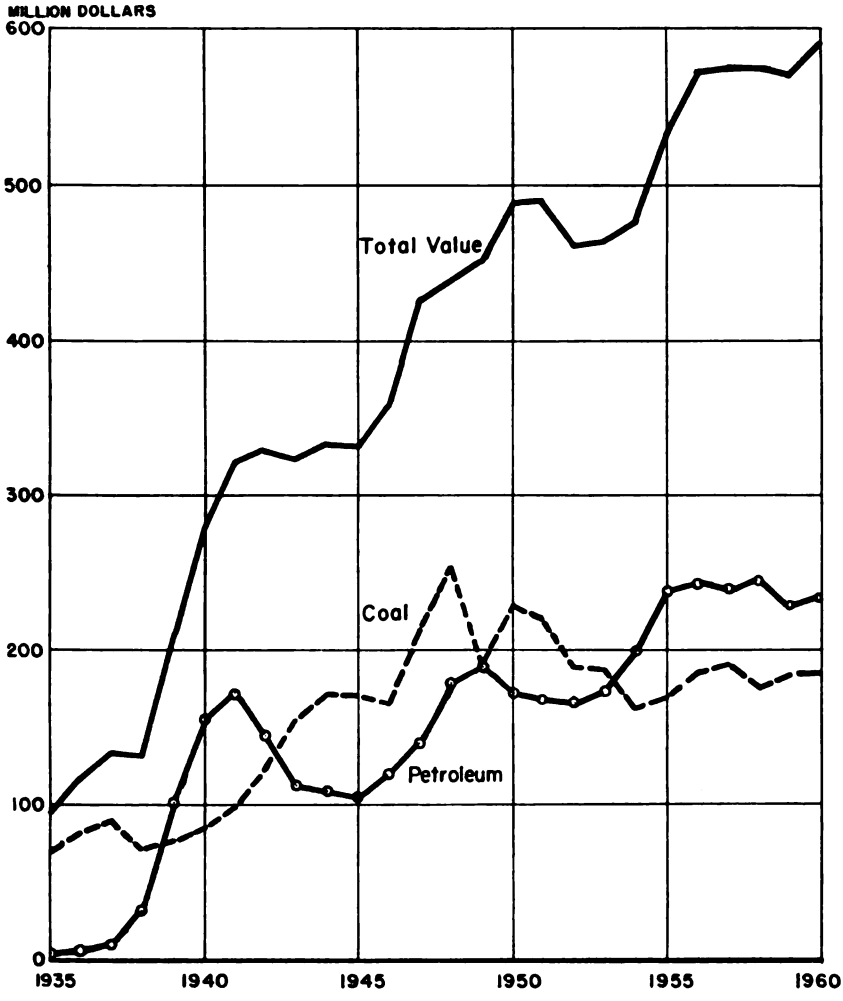

FIGURE 1.—Value of coal, petroleum, and total value of mineral production in Illinois, 1935–60.

**Employment and Injuries.**—Over 36.3 million man-hours was worked in the State's mineral industries in 1960, excluding officeworkers and employees of the entire petroleum industry. This represented a 4-percent decrease from the final figure of 37.8 million man-hours in 1959. Injury experience was less favorable than in the preceding year. A total of 15 fatal and 1,166 nonfatal disabling injuries was recorded for Illinois mineral industries in 1960, compared with 11 fatal and 1,081 nonfatal injuries in 1959. Table 2 contains a summary of employment and injury statistics for selected mineral industries. Certain industries are excluded from the table to avoid disclosing individual company confidential data.

# REVIEW BY MINERAL COMMODITIES

## MINERAL FUELS

**Coal.**—Output of bituminous coal increased 1 percent in quantity over 1959 but decreased slightly in total value. Coal was produced from 128 mines in 33 counties, compared with 137 mines in 36 counties in 1959. (Data exclude mines producing less than 1,000 short tons annually.) Major producing counties in order of decreasing production were Williamson, Fulton, St. Clair, Franklin, Christian, Saline, Jefferson, Perry, Knox, Montgomery, Randolph, Jackson, and Vermilion. Nine companies supplied 80 percent of total output, each producing over 1 million tons. The No. 10 and the River King mines of Peabody Coal Co. and the Orient No. 3 mine of Freeman Coal Mining Corp. were among the 10 largest producing mines in the United States in 1960.

Underground mines furnished 51 percent of the total production, and strip mines furnished 49 percent. Output from underground mines decreased 1 percent from 1959, whereas strip-mine production increased 3 percent.

[1] Figure withheld to avoid disclosing individual company confidential data; included in total.

Nearly 91 percent of the coal output was cleaned at 59 plants. All but a fraction of a percent of the underground production was cut by machines. Over 99 percent was loaded mechanically, using a total of 131 mobile loaders, 45 continuous-mining machines, and 8 duckbills or self-loading conveyors. A total of 170 power shovels and draglines, including wheel excavators, were utilized in stripping and loading operations at strip mines. Eighty-eight percent of the output was shipped to consumers by rail or waterway; the remainder was shipped by truck.

Approximately 26 million tons of coal was mined for use in electric powerplants, an increase of 2 million tons over 1959. Other markets for Illinois coal included general manufacturing and processing industries in the Midwest, domestic consumers, coke and gas plants, and railroads. Each of these purchased less coal than in the previous year. Over 69 percent of the 38.7 million tons of coal consumed in Illinois in 1960 was mined in the State. Average mine value was $4.00 per ton, compared with $4.08 in 1959.

Freeman Coal Mining Corp. began operating its new Orient No. 5 underground mine near Benton late in the year. The United Electric Coal Cos. began full-scale production at the Banner No. 27 strip mine near Glasford. In January, Old Ben Coal Corp. hoisted the

Digitized by Google

first coal from its new No. 21 underground mine at Sesser. This mine reportedly had a reserve of about 100 million tons of low-sulfur metallurgical coal. The company abandoned its Nos. 22 and 14 underground mines in January and June, respectively. In April, Stonefort Coal Mining Co., Inc., began operating its Allendale strip mine near Wyoming and abandoned the Little John strip mine near Victoria. The St. Ellen underground and Seminole strip mines in St. Clair County were abandoned by Peabody Coal Co. in May. The Orient Number Two Coal Co. abandoned the Orient No. 2 underground mine in Franklin County in November.

**Coke.**—Coke was produced at 6 plants. Total production was 1,971,000 short tons, valued at $37.1 million, compared with 2,045,000 tons, valued at $37.8 million in 1959. Over 1.8 million tons was used by producing companies in blast furnaces. About 161,000 tons of coke breeze valued at $893,000 was recovered at Illinois coke plants. Nearly 80,000 tons was used by producers in steam powerplants and agglomerating plants. Other products of coke-oven plants included coke-oven gas, ammonia, tar, and light oil.

**Peat.**—Production of peat decreased markedly from 1959. Output was reported by 3 companies in Cook, Kane, and Lake Counties. Although classed as a mineral fuel, Illinois peat was used principally for soil conditioning. The entire output was sold in bulk.

**Petroleum and Natural Gas.**—Crude-petroleum output increased nearly 3 percent in quantity and 2 percent in value over 1959 and comprised 39 percent of the total value of State mineral production. Output was chiefly from oilfields in the southeastern part of the State. Hydraulic-fracturing and water-flooding methods accounted for about half the total production. According to the Illinois State Geological Survey, 1,922 wells were completed in 1960, of which 769 were producing oil wells, 10 were gas wells, 526 were dry holes in pools, and 617 were unsuccessful wildcats. Total footage drilled was 4,027,597, of which 44 percent was in producing wells. Estimated proved crude-oil reserves at the beginning of 1960 were 594 million barrels, according to the American Petroleum Institute.

Marketed production of natural gas decreased 15 percent in quantity and 24 percent in value compared with 1959. Output of liquefied petroleum gases increased in quantity and value, whereas production of natural gasoline decreased, compared with 1959.

[3] Bureau of Mines figures.

## NONMETALS

**Cement.**—Shipments of portland and masonry cements from Illinois plants decreased 8 and 16 percent in quantity, respectively, from 1959. Chief reason for the marked drop was the decline in sales for building construction, which was not offset by a substantial increase in sales for highway construction. Total value of output decreased 3 percent for portland cement and 14 percent for masonry cement, compared with 1959. Average unit values for both cements increased. Plants were operated in LaSalle and Lee Counties, by 4 companies.

Nearly 97 percent of the portland cement output consisted of types I and II (general use and moderate heat). The remainder was chiefly type III (high early strength). Over 59 percent was sold to ready-mixed concrete companies, 20 percent to highway contractors, 13 percent to concrete-product manufacturers, 7 percent to building-material dealers, and less than 1 percent to miscellaneous consumers. Approximately 98 percent of the output was shipped by rail; the remainder was shipped mostly by truck. About 87 percent of the portland cement and 51 percent of the masonry cement was shipped to consumers within the State.

**TABLE 5.—Finished portland cement produced and shipped**

(Thousand barrels and thousand dollars)

| Year | Active plants | Production | Shipped from mills | |
|---|---|---|---|---|
| | | | Quantity | Value |
| 1951-55 (average) | 4 | 8,704 | 8,701 | $21,690 |
| 1956 | 4 | 8,823 | 8,629 | 24,866 |
| 1957 | 4 | 8,794 | 8,097 | 24,560 |
| 1958 | 4 | 9,433 | 9,205 | 29,308 |
| 1959 | 4 | 9,559 | 9,486 | 30,158 |
| 1960 | 4 | 9,270 | 8,770 | 29,321 |

Digitized by Google

Producing companies quarried over 2.6 million tons of limestone for use in manufacturing portland cement. Other raw materials consumed included over 175,000 tons of clay or shale and 49,000 tons of gypsum. Approximately 233 million kw.-hr. of electrical energy was used at the plants in 1960. Annual finished portland cement capacity remained at about 10 million barrels.

Medusa Portland Cement Co. announced plans for a major expansion program which included construction of a new kiln at its Dixon plant. Annual capacity of the new kiln was expected to be 1 million barrels. The company also was acquiring limestone properties in the southern part of the State, in an area regarded as a potential site for a new cement plant.

**Clays.**—Total output of miscellaneous and fire clays increased 6 percent in quantity and 11 percent in value over 1959. A substantial increase in production for manufacturing heavy clay products was recorded.

Production of fire clay increased 12 percent in quantity over 1959. Output was reported by 11 companies in Greene, Grundy, La Salle, McDonough, Marshall, Rock Island, and Tazewell Counties. The material was used for refractory purposes, manufacturing heavy clay products, and other uses.

**TABLE 6.—Clays sold or used by producers, by kinds**

(Thousand short tons and thousand dollars)

| Year | Fire clay | | Miscellaneous clay | | Total | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 397 | $1,243 | 1,922 | $2,742 | 2,319 | $3,986 |
| 1956 | 441 | 870 | 1,817 | 3,136 | 2,258 | 4,005 |
| 1957 | 438 | 2,345 | 1,479 | 2,810 | 1,917 | 5,155 |
| 1958 | 725 | 2,733 | 1,610 | 3,177 | 2,335 | 5,910 |
| 1959 | 322 | 2,158 | 1,908 | 2,792 | 2,229 | 4,950 |
| 1960 | 359 | 2,378 | 1,997 | 3,101 | 2,357 | 5,479 |

Miscellaneous clay was produced in 20 counties and was used for manufacturing building brick, draintile, sewer pipe, lightweight aggregate, cement, pottery, and other purposes. Output increased 5 percent in tonnage over 1959.

The Illinois State Geological Survey published a report covering investigations made to determine shale deposits that were self-bloating, those that require addition of bloating agents, and the mechanism and requirements that control the bloating of shales.[2]

**Fluorspar.**—Illinois ranked first among the 7 fluorspar-producing States, furnishing nearly 59 percent of total domestic shipments. Illinois output increased 20 percent in quantity and 17 percent in value over 1959, a poor year. Although somewhat improved, market conditions remained generally depressed, principally because of the high level of imports, which exceeded domestic shipments for the ninth consecutive year. However, some mines began operating 6 days a week, and some previously laid-off employees were recalled to work.

[2] White, Arthur W., Lightweight Aggregate From Illinois Shales: Illinois State Geol. Survey Circ. 290, 1960, 29 pp.

Digitized by Google

Results of a U.S. Tariff Commission investigation of the domestic fluorspar industry, conducted in response to a Senate resolution authorizing the Commission to make specific findings on further import restrictions, were made public. No recommendations were made because the Commission felt that recommendations for restrictions would be extra legal.

Approximately 76 percent of the fluorspar shipments were classified as acid grade; 13 percent as metallurgical grade; and 11 percent as ceramic grade. Shipments of acid-grade fluorspar increased nearly a fourth over 1959, the result of increased demand by the aluminum and chemical industries. Metallurgical-grade shipments increased chiefly because of increased consumption at steel plants after the strike-affected previous year. Shipments of ceramic-grade fluorspar decreased substantially from 1959.

Major fluorspar producers included Aluminum Company of America, Mackey-Humm Mining Co., Minerva Oil Co., and Ozark-Mahoning Co. All except Mackey-Humm Mining Co. also produced lead and/or zinc concentrates as byproducts of fluorspar mining. Minerva Oil Co. resumed operations at its Jefferson mine and began sinking a new shaft on the adjacent Fairbairn property. The company also began shipping bagged fluorspar concentrate by barge to Wellsville, Ohio, for distribution by truck from that point. Ozark-Mahoning Co. began processing some of its ore by heavy-medium separation preparatory to flotation. Wiley Cochran began production from a new mine in the Karbers Ridge area.

Mills in Illinois processed 392,000 tons of crude ore, from which nearly 131,000 tons of finished fluorspar was produced. The entire output of finished fluorspar came from Hardin County, although several thousand tons of crude ore was mined in Pope County.

Reports describing the geology, production, economic aspects, and uses of Illinois fluorspar [3] and exploration, development, and mining practices at two fluorspar mines in the State [4] were published.

**Gem Stones.**—Gem materials, consisting of fluorite and other mineral specimens, were collected by several companies and/or individuals. The specimens were used primarily for personal collections.

**Lime.**—Illinois ranked eighth in quantity of lime produced in 1960. Output was from plants in Adams and Cook Counties. Total shipments of quicklime and hydrated lime increased 10 percent in both quantity and value over 1959. Chief reason for the gain was the 13-percent increase in sales of quicklime for refractory purposes. Nearly 63 percent of the total was for refractory use, 31 percent for chemical and other industrial uses, and 6 percent for building purposes. A small quantity was sold for agricultural use.

**Perlite.**—Perlite-processing plants were operated in Champaign, Cook, Lake, and Will Counties. Crude material processed at the plants was mined in Colorado, Nevada, and New Mexico. Total sales of expanded perlite decreased substantially from 1959, principally because of the decline in building construction. Nearly 35 percent

[4] Montgomery, Gill, Daly, J. J., and Myslinski, Frank J., Mining Methods and Costs at Crystal-Victory and Minerva No. 1 Fluorspar Mines of Minerva Oil Co., Hardin County, Ill.: Bureau of Mines Inf. Circ. 7956, 1960, 45 pp.

Digitized by Google

of the output was used as lightweight aggregate in building plaster. Over 31 percent was used as concrete aggregate. The remainder was for loose-fill insulation, filler, filter use, soil conditioning, and other purposes.

**Sand and Gravel.**—A record high production of 33.1 million short tons of sand and gravel was established, surpassing the previous high of 31.2 million tons set in 1956. The new mark represented a 10-percent increase over 1959. Illinois was one of the largest producing States, ranking fifth in 1960. Value of output increased 8 percent over 1959. Chief reason for the substantial rise was the 2.8-million-ton increase for paving use. Use of material for building construction was less than 1 percent higher than in 1959. Output for railroad ballast decreased 46 percent. Total output of industrial sands remained substantially the same as in 1959; an 11-percent increase in production of glass sand offset declines for other industrial uses.

**TABLE 7.—Sand and gravel sold or used by producers, by classes of operations and uses**

(Thousand short tons and thousand dollars)

| Class of operation and use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |

Digitized by Google

Nearly 62 percent of production was for paving use, 24 percent was for building purposes, and 8 percent was for industrial use. The remainder was for railroad ballast, fill, and other uses.

About 81 percent of the output was transported by truck and nearly 19 percent by rail. A small quantity was moved by water.

Production was reported from 72 counties. Major-producing counties—more than 1 million tons each—in 1960 were: Grundy, Kane, Lake, La Salle, McHenry, Peoria, Tazewell, Will, and Winnebago. Major producers included Chicago Gravel Co., Consumers Co., Elmhurst-Chicago Stone Co., Larson Bros. Sand & Gravel, McGrath Sand & Gravel Co., Inc., Material Service Corp., Ottawa Silica Co., Portage-Manley Sand Co., C. A. Powley Co., Road Materials Corp., and Wedron Silica Co.

**Stone.**—Production of stone reached a new high of 41.7 million short tons, an 18-percent increase over 1959, the previous record year. The substantial gain moved Illinois into second place in tonnage, among the producing States, exceeded only by Pennsylvania. The output consisted entirely of limestone, except for about 600 tons of sandstone produced in Alexander County for refractory purposes. Total value of output increased 23 percent over 1959. High demand for crushed limestone for road construction was the chief reason for the increase.

**TABLE 8.—Limestone sold or used by producers, by uses**

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |

| Total.....do.... | 35,186 | 44,711 | 41,714 | 55,452 |
| Grand total.....do.... | 35,190 | 44,886 | 41,720 | 55,587 |

[1] Uses as shown combined to avoid disclosing individual company confidential data.
[2] Average weight of 170 pounds per cubic foot used to convert cubic feet to short tons.
[3] Includes limestone for chemical uses, filler, metallurgical, and other purposes combined to avoid disclosing individual company confidential data.

Production for concrete aggregate and roadstone increased 5.2 million tons (19 percent) over 1959, and comprised 78 percent of the stone output. Crushed limestone for agricultural use increased 570,000 tons over 1959 and represented 8 percent of the total production. Other substantial gains were recorded for railroad ballast, blast furnace flux, riprap, and coal mine dust. Quantities of crushed lime-

Digitized by Google

stone used in alkali works, asphalt mix, various fillers, and as mineral food decreased. Material for other uses remained substantially the same.

Limestone was produced in 61 counties. The following 10 counties each produced over 1 million tons of limestone and together comprised nearly 67 percent of the State output: Cook, DuPage, Johnson, Kankakee, La Salle, Livingston, Randolph, St. Clair, Vermilion, and Will. Cook County, alone, furnished 31 percent of the total with output of 12.9 million tons. Major producers of limestone included Allied Chemical Corp., Anna Quarries, Inc., Columbia Quarry Co., Consumers Co., Dolese & Shepard Co., East St. Louis Stone Co., Elmhurst-Chicago Stone Co., Lehigh Stone Co., Marquette Cement Mfg. Co., and Material Service Corp.

Dimension limestone was produced in Cook, Kane, McHenry, Ogle, Pike, St. Clair, and Union Counties. Output was used for house stone veneer, flagging, and rubble.

**Sulfur.**—Elemental sulfur was recovered as a byproduct by the Pure Oil Co. at its Lemont refinery and by The Anlin Company of Illinois at its Hartford plant. Total output was somewhat greater than in 1959 because of the full-year operation of the latter plant, which began producing late in 1959. The 150-ton sulfur-recovery plant of The Anlin Company utilized refinery gases obtained from an adjoining Shell Oil Co. refinery.

**Tripoli (Amorphous Silica).**—Ozark Minerals Co. and Tamms Industries Co. mined and processed tripoli, or amorphous silica, near Elco and Tamms, respectively. Production of crude material increased 8 percent over 1959; sales of prepared material increased 20 percent in quantity and 8 percent in value. Output was sold for abrasive, filler, and other purposes.

**Vermiculite.**—Three companies exfoliated vermiculite at plants in Cook, Macoupin, and Will Counties from crude material mined in Montana, South Carolina, and South Africa. Output decreased slightly from 1959. Processed material was used as insulating material, lightweight aggregate in plaster and concrete, and for other purposes.

## METALS

**Lead and Zinc.**—Production of lead and zinc, in terms of recoverable metals, increased 17 and 10 percent, respectively, in quantity over 1959. Chief reason for the rise was increased production from fluorspar mines in the Southern Illinois district that recovered lead and zinc as byproducts. Total values of these metals increased 19 percent for lead and 24 percent for zinc.

Principal producers in Northern Illinois (Jo Daviess County) were Eagle-Picher Co. and Tri-State Zinc, Inc. Both companies operated their mines throughout the year except for a strike at Eagle-Picher Co. operations during all of October. Major producers in Southern Illinois (Hardin and Pope Counties) were Aluminum Company of America, Minerva Oil Co., and Ozark-Mahoning Co.

Average weighted yearly prices used to calculate total values of lead and zinc production in 1960 were 11.7 cents per pound for lead and 12.9 cents per pound for zinc, compared with 11.5 cents per pound

Digitized by Google

for both metals in 1959. Prices were relatively stable in 1960. The quoted price of lead, New York, opened in January at 12 cents per pound and remained at that level until December 13, when it dropped to 11 cents. No further changes occurred before the close of the year. The quoted zinc price, East St. Louis, opened in 1960 at 12.5 cents per pound. On January 8 the price rose to 13 cents. The price declined to 12.5 cents December 13. Another half-cent decrease December 19 brought the yearend price to 12 cents.

**TABLE 9.—Mine production of silver, lead, and zinc, in terms of recoverable metals**

| Year | Mines producing | Materials sold or treated [1] (short tons) | Silver | | Lead | | Zinc | | Total value |
|---|---|---|---|---|---|---|---|---|---|
| | | | Troy ounces | Value | Short tons | Value | Short tons | Value | |
| 1951–55 (average) | 19 | 786,362 | 2,764 | $2,501 | 3,718 | $1,118,769 | 18,255 | $5,195,138 | $6,316,408 |
| 1956 | 23 | 851,285 | 1,580 | 1,430 | 3,832 | 1,203,248 | 24,039 | 6,586,686 | 7,791,364 |
| 1957 | 23 | 853,661 | -------- | -------- | 2,970 | 849,420 | 22,185 | 5,146,920 | 5,996,340 |
| 1958 | 19 | 1,003,020 | -------- | -------- | 1,610 | 376,740 | 24,940 | 5,087,760 | 5,464,500 |
| 1959 | 22 | 930,265 | -------- | -------- | 2,570 | 591,100 | 26,815 | 6,167,450 | 6,758,550 |
| 1960 | 22 | 1,015,581 | -------- | -------- | 3,000 | 702,000 | 29,550 | 7,623,900 | 8,325,900 |

[1] Data include fluorspar ore from which lead and/or zinc was recovered as follows: 1951, 332,028 tons; 1952, 384,203 tons; 1953, 353,570 tons; 1954, 202,478 tons; 1955, 309,311 tons; 1956, 336,635 tons; 1957, 360,406 tons; 1958, 401,562 tons; 1959, 297,252 tons; and 1960, 380,385 tons.

**TABLE 10.—Mine production of lead and zinc in 1960, by months, in terms of recoverable metals**

(Short tons)

| Month | Northern Illinois | | Southern Illinois | | Total Illinois | |
|---|---|---|---|---|---|---|
| | Lead | Zinc | Lead | Zinc | Lead | Zinc |
| January | 100 | 1,520 | 135 | 660 | 235 | 2,180 |
| February | 100 | 1,870 | 130 | 635 | 230 | 2,505 |

| September | 100 | 1,800 | 150 | 770 | 250 | 2,570 |
| October | 110 | 1,000 | 150 | 765 | 260 | 1,765 |
| November | 110 | 1,400 | 160 | 750 | 270 | 2,150 |
| December | 100 | 1,425 | 155 | 745 | 255 | 2,170 |
| Total | 1,245 | 20,325 | 1,755 | 9,225 | 3,000 | 29,550 |

A publication concerning the geology of the Upper Mississippi Valley zinc-lead district was issued early in 1960.[5] The report was prepared by the Federal Geological Survey in cooperation with the Illinois State Geological Survey, the Iowa Geological Survey, and the Wisconsin Geological and Natural History Survey. The Upper Mississippi Valley district includes approximately 4,000 square miles in Illinois, Iowa, and Wisconsin. The report describes the geology,

[5] Heyl, A. V., Jr., Agnew, A. F., Lyons, E. J., and Behr, C. H., Jr., with special sections by Flint, A. E., The Geology of Upper Mississippi Valley Zinc-Lead District: U.S. Geol. Survey Prof. Paper 309, 1959 (1960), 310 pp.

Digitized by Google

areal and economic, and summarizes the stratigraphy and geomorphology of the entire district. Detailed geologic maps of favorable areas and mines are included in the report, and about 500 mines are described.

A bill granting subsidies to small lead-zinc mines passed both Houses of Congress but was vetoed by the President. Import quotas for lead and zinc were continued throughout 1960.

**Pig Iron and Steel.**—Approximately 5,247,000 short tons of pig iron was shipped from Illinois in 1960, a slight decrease from the 1959 figure. Estimated value of output was over $316 million. Twenty-two blast furnaces were operated by 6 companies in Chicago and Granite City. These furnaces operated at 67 percent of capacity. Granite City Steel Co. dismantled its old B furnace, which was to be replaced with a new blast furnace as part of an expansion program. Construction of the new furnace was nearing completion at the close of the year. Interlake Iron Corp. completed construction of a new continuous iron-ore sintering plant late in the year. Capacity of the plant was more than 3,000 short tons of sinter per day.

Over 7.1 million short tons of domestic iron and manganiferous ores (excluding agglomerates) was consumed in blast and steel furnaces and agglomerating plants. In addition, 1.4 million short tons of iron-ore pellets, produced at or near out of State mine sites, was consumed at furnaces in Illinois. Over 715,000 tons of foreign ore also was consumed. Nearly 3 million tons of sinter was produced at consuming furnaces. Approximately 4.4 million tons of agglomerate (sinter and pellets) was consumed. Other materials consumed in Illinois furnaces included 4 million tons of coke and 2 million tons of limestone and dolomite. The above data excludes nonintegrated steel plants.

Steel production was 8,229,281 short tons, according to the American Iron & Steel Institute, a slight increase over 1959. As of the beginning of 1960, annual capacity of the State's 95 steel furnaces, operated by 13 companies, was 12,794,000 tons.

**Other Metals.**—Refined thorium compounds were manufactured from monazite concentrate by the Lindsay Chemical Division of American Potash and Chemical Corp. at West Chicago. The company also produced rare-earth compounds.

Small but valuable quantities of certain metals, such as cadmium, gallium, and germanium, are recovered from Illinois ores in later processing stages. Because it is virtually impossible to distribute such mineral products by States of origin, their values are not included in the total value of mineral output of any State.

## REVIEW BY COUNTIES

Mineral production, excluding liquid fuels and natural gas, was reported in 94 of the 102 counties in 1960. La Salle County continued to rank first, with mineral output valued at more than $35 million. Other leading counties, with total value of mineral production exceeding $10 million, were Christian, Cook, Franklin, Fulton, Hardin, Jefferson, Perry, St. Clair, Saline, and Williamson. Mineral values increased over 1959 for 62 counties; 34 counties recorded decreases from the preceding year; and no change was reported for 1 county. Ex-

Digitized by Google

cluded from the county-review section are details on liquid-fuel and natural gas operations, for which county breakdowns were not available. References to coal producers pertain only to those producing 1,000 short tons or more annually, unless otherwise stated.

**Adams.**—Quicklime and hydrated lime were produced at plants operated near Quincy by Marblehead Lime Co. and Menke Stone & Lime Co. chiefly for building, chemical, and industrial uses. These companies and the Black White Limestone Co. operated underground limestone mines in the county. Other limestone producers included Missouri Gravel Co. and Western Illinois Stone Co. The latter operated 3 quarries, near Loraine, Marcelline, and Quincy. Limestone was produced for various purposes, including concrete aggregate and roadstone, agriculture, flux, mineral food, various fillers, riprap, and lime manufacture.

**TABLE 11.—Value of mineral production in Illinois, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Adams | $1,847,868 | $2,310,787 | Stone, lime, coal, sand and gravel. |

[1] Excludes gem stones, petroleum, natural gas, natural gas liquids, and some stone and sand and gravel for which data by counties are not available; included with "Undistributed." The following counties did not report production: Edgar, Hamilton, Jasper, Piatt, and Richland.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Revised figure.

Sand and gravel and crushed limestone for road use were produced under contract for the State highway department. Quincy Sand Co. produced sand and gravel for building, fill, and other purposes at its dredging operation near Quincy. Blick's Construction Co. produced paving sand, also near Quincy.

Triple S Mines, Inc., produced coal for local consumption from its No. 2 strip mine near Augusta. Some of the coal was crushed, cleaned by jigging methods, and oil treated.

**Alexander.**—Ozark Minerals Co. and Tamms Industries, Inc., near Elco and Tamms, respectively, produced amorphous silica. Both companies operated underground mines. Crude material was crushed, ground, sized, and dried at company-operated mills. Most of the processed material was bagged and shipped to consumers by rail. Output was greater than in 1959.

Digitized by Google

Sandstone was produced near Elco by the Western Fire Brick Co. Crude material was shipped to the company plant in East St. Louis for grinding. Output was sold chiefly for use in furnace linings.

H. H. Halliday Sand Co. operated a dredge on the Ohio River near Cairo and produced sand and gravel for building and road construction and railroad ballast. The county highway department produced paving gravel.

**Bond.**—The Bond Stone Co. produced crushed limestone from a quarry near Sorento. Output was used entirely as roadstone.

Richards Brick Co. mined clay near New Douglas, for manufacturing building brick at its plant in Edwardsville, Madison County.

Cyril Munie operated both fixed and portable sand and gravel plants and produced material for building and road construction and other uses. Greenville Gravel Co., Inc., produced gravel for building use at its fixed plant at Greenville. Paving sand was produced under contract for the State highway department.

**Boone.**—Belvidere Lime Quarry produced crushed limestone for roadstone and agricultural purposes at a quarry near Belvidere.

Several companies produced sand and gravel for building and road construction and other uses. Paving gravel was produced under contract for the county highway department.

**Brown.**—Crushed limestone for roadstone and agricultural use and sand and gravel for paving use and fill were produced by T. F. Hollembeak & Sons near Mount Sterling. Missouri Gravel Co. operated a portable crushing plant and produced limestone for road use. Paving gravel was produced under contract for the State highway department.

The Frederic Brick & Tile Co. produced clay near Mount Sterling and used the material for manufacturing building brick and draintile.

In March, the Big Four Mines acquired the strip coal mine formerly operated by K. D. Malcomson near Mount Sterling. Combined output of both companies was less than 1,000 short tons.

**Bureau.**—Midland Electric Coal Corp. produced 371,000 short tons of coal from its Mineral No. 1 strip mine, the only active coal mine in the county. The entire output was cleaned at the company plant, which also treated coal from the Victoria No. 5 mine of Midland Collieries, Inc., in Knox County. Shipments were primarily by rail.

Clay was mined near Sheffield by Sheffield Shale Products Co. for use in manufacturing building brick and other heavy clay products.

Sand and gravel was produced by 4 commercial operators near Manlius, Princeton, Spring Valley, and Wyanet. Output was for building and road construction, molding sand, fill, and other uses. Gravel was produced by the county highway department and the city of Princeton for paving use and fill, respectively. The State and county highway departments contracted for paving gravel.

The New Jersey Zinc Co. operated a zinc smelter at Depue. A labor strike began on August 5 and ended November 26 when the company and the United Steelworkers union signed a new contract, which expires July 27, 1963.

**Champaign.**—Expanded perlite was produced by the Ryolex Corp. at Champaign for use principally as lightweight aggregate in plaster and concrete. Crude material processed was mined in New Mexico.

615629—61——24

Digitized by Google

Fixed and portable sand and gravel plants were operated in the vicinities of Champaign, Ludlow, Mahomet, and Rantoul. Output was for building and road purposes, fill, and other uses. A report on the sand and gravel resources of the county was published.[6]

**Christian.**—Peabody Coal Co. produced coal from its No. 10 underground mine near Pawnee, the second largest producing mine in the United States in 1960. Output was 4.1 million tons, a 9-percent increase over 1959. Part of the output was cleaned by jigging methods.

Crushed limestone was produced by Edinburg Quarries and Tri-County Stone Co. near Edinburg and Nokomis, respectively. The material was used for roadstone and agriculture.

**Clinton.**—Citizens Coal Co. and Marion County Coal Mining Corp. produced coal from underground mines near Breese and Centralia, respectively. Total production increased 51 percent over 1959. Output was primarily for local consumption.

Crushed limestone was produced chiefly for use as roadstone. The county highway department produced gravel for building purposes. Paving sand was produced under contract for the State highway department.

**Cook.**—Total value of Cook County mineral output topped $30 million, 22 percent more than that of 1959. Limestone was produced for concrete aggregate and roadstone, agriculture, railroad ballast, flux, manufacturing lime and dead-burned dolomite, asphalt filler, coal-mine dust, riprap, flagging, and other uses. Material Service Corp. continued operating its Federal, Riverside, Stearns, and Thornton quarries. Consumers Co. produced limestone from the Bellwood and McCook quarries. An article concerning the company's new 1,500-ton-per hour crushing and screening plant at the McCook quarry was published.[7] Other producers of limestone included Dolese & Shepard Co., operating a quarry near Hodgkins; Arcole Mid-West Corp., Lemont Stone & Material Co., and Elroy & Son, operating quarries near Lemont; and H. Turner & Son. The State highway department contracted for roadstone and paving gravel.

Sand and gravel producers included Chicago Gravel Co., Consumers Co., Material Service Corp., Road Materials Corp., and Worth Sand & Gravel Co., Inc. Output was for building and road construction, railroad ballast, and other purposes.

Marblehead Lime Co. produced quicklime and hydrated lime at plants in South Chicago and Thornton for building and various chemical and industrial uses. Quicklime for refractory use was produced at La Grange by Standard Lime & Cement Co.

Clays were produced chiefly for manufacturing building brick. Producers included Brisch Brick Co., Carey Brick Co., Chicago Brick Co., Illinois Brick Co., and Tuthill Building Materials Co.

Peat was produced and sold chiefly for soil conditioning.

The Pure Oil Co. recovered sulfur as a byproduct at its Lemont Refinery.

Perlite was expanded by Silbrico Corp. at Chicago from crude material mined in Western States. The processed material was used

[6] Anderson, R. C., Sand and Gravel Resources of Champaign County, Illinois: Illinois State Geol. Survey Circ. 294, 1960, 15 pp.
[7] Pit and Quarry, Automated Control: Vol. 52, No. 12, June 1960, p. 80.

Digitized by Google

for lightweight aggregate in plaster and concrete, insulation, soil conditioning, and other purposes.

U.S. Mica Co., Inc., produced ground mica at its plant in Forest Park.

Vermiculite was exfoliated at Chicago by Zonolite Co. from crude material mined outside the State.

Lindsay Chemical Division of American Potash & Chemical Corp. manufactured refined thorium compounds and rare-earth compounds at Chicago.

Blast and steel furnaces and coke-oven plants were operated in the Chicago area. Many of the furnaces were banked because of lack of demand for steel. Pig-iron producers were Interlake Iron Corp., International Harvester Co., Republic Steel Corp., United States Steel Corp., and Youngstown Sheet & Tube Co. All except United States Steel Corp. operated coke ovens. A new self-fluxing sinter plant was constructed by Interlake Iron Corp. at its Chicago facilities. The plant was built by Dravo Corp. under license from Lurgi Co. of Germany. Daily capacity of the new plant was over 3,300 short tons of sinter.

Steel producers included Acme Steel Co., Borg-Warner Corp., Ceco Steel Corp., Columbia Tool Steel Co., A. Finkl & Sons Co., H. M. Harper Co., International Harvester Co., Republic Steel Corp., and United States Steel Corp. H. M. Harper Co. completed a major expansion program which included four building additions having about 26,000 square feet of floor space and new equipment for producing stainless steel.

**Douglas.**—Approximately 506,000 tons of coal was produced by Moffat Coal Co. from its underground mine near Murdock. The entire output was cleaned by jigging. About three-fifths of the output was shipped to consumers by rail. The remainder was sold chiefly for local consumption.

**Du Page.**—Elmhurst-Chicago Stone Co. operated a limestone quarry at Elmhurst and produced material for use principally as concrete aggregate, roadstone, and railroad ballast. The company also operated stationary sand and gravel plants at Winfield and Warren. Output was for building and road construction. A quantity of sand and gravel was produced by township crews for road use.

**Edwards.**—Albion Brick Co. produced clay near Albion for manufacturing building brick.

Sand and gravel for various uses was produced near Albion by George Aulvin Sand & Gravel Co.

**Fayette.**—Diller Shale Products produced clay near St. Elmo for use in manufacturing draintile. Most of the finished product was sold to farmers in the area; the remainder was sold to lumber yards and other retailers for construction use.

Burtschi Sand & Gravel Co. and Melvin Dugan operated stationary sand and gravel plants near Vandalia and Hagarstown, respectively. Output was for building and road construction and other uses. Forrest Lutz produced natural-bonded molding sand near Mulberry Grove. Output was shipped mostly to steel companies and foundries. A small quantity was sold for paving use. The State highway department contracted for paving gravel.

Digitized by Google

**Franklin.**—Approximately 4.1 million tons of coal was produced, a 10-percent decrease from 1959. Output was from 6 underground mines. Old Ben Coal Corp. operated the Nos. 9, 14, 21, and 22 mines in 1960. The Nos. 22 and 14 mines were abandoned in January and June, respectively. The company began operating its new No. 21 mine near Sesser in January, producing low-sulfur metallurgical coal. The mine was expected to become one of the Nation's largest producing mines with a potential capacity of 15,000 tons per day. Freeman Coal Mining Corp. began initial production from the Orient No. 5 mine near Benton in November. Output was cleaned at the company plant in Williamson County. The Orient No. 2 mine of Orient Number Two Coal Co., near West Frankfort, was abandoned in November.

Paving gravel was produced under contract for the State highway department.

**Fulton.**—Fulton County ranked second in coal production, with more than 5.3 million tons, a 5-percent increase over 1959. Most of the output came from 15 strip mines; 3 underground mines supplied 26,600 tons. Approximately 95 percent of the production was cleaned at 7 plants. Full-scale production began at the Banner No. 27 strip mine, operated by The United Electric Coal Cos. near Glasford. A detailed article on the mine was published.[8] Bruketta & Sons Coal Co. abandoned its underground mine near Farmington in July. Little Coal Co. and Gibson Coal Co. opened strip mines in April and September, respectively.

Sand and gravel for building and road construction and other uses was produced by three companies.

**Gallatin.**—Coal was produced by three companies, operating one strip and two underground mines. None of the output was mechanically cleaned or treated. Over half the shipments were by barge on the Ohio River. Nearly all the remainder was sold locally. H. & V. Coal Co. began operating a new strip mine in August.

Paving sand and gravel was produced by Gail Denny Sand Co. and the county highway department and under contract for the State highway department.

**Greene.**—American Vitrified Products Co. produced clay near White Hall for use in manufacturing sewer pipe. Clay was produced near Roodhouse by Wyatt's Clay Mines, Inc., formerly Wyatt Clay Mines, and used by the company in manufacturing building brick.

Birch Creek Coal Co. produced coal from its strip mine near Roodhouse. Output decreased slightly from 1959. All shipments were for local consumption. A small quantity was treated with oil.

Limestone was produced by 5 companies, operating quarries near East Hardin, Hillview, Kane, and Roodhouse. Output was chiefly for roadstone, agriculture, and riprap. Paving gravel was produced by Lyle B. Moushon for the State highway department.

**Grundy.**—Clay was produced near Coal City by Illinois Clay Products Co. for use chiefly in manufacturing refractories. A small quantity was used for manufacturing miscellaneous heavy clay products. The cutback in steel production adversely affected sales in 1960.

---

Digitized by Google

Sand and gravel was produced by Material Service Corp. near Morris chiefly for paving use. The State highway department contracted for paving gravel.

**Hardin.**—Shipments of finished fluorspar increased about one-fifth over 1959. Major producing companies were Aluminum Company of America, Mackey-Humm Mining Co. Minerva Oil Co., and Ozark-Mahoning Co. Aluminum Company of America continued to operate its group of mines and mill near Rosiclare. Acid-grade fluorspar and lead and zinc concentrates were produced at the mill, which treated some custom ore as well as company-mined material.

Minerva Oil Co. operated its Crystal and No. 1 mines and mills. Fluorspar, lead, and zinc concentrates were produced at the Crystal mill, whereas only fluorspar and zinc concentrates were produced at the No. 1 plant. Some custom ore was processed at both plants. The company also resumed operations at the Jefferson mine and began sinking a shaft on the adjacent Fairbairn property. In the latter part of the year the company was operating its mines and plants 6 days a week. The company began shipping fluorspar concentrate in 4-ply paper bags by barge on the Ohio River to Wellsville, Ohio. The bagged product was stored in a warehouse at Wellsville for subsequent distribution by truck. As a result, freight costs were reduced substantially.

Ozark-Mahoning Co. operated mines near Cave-in-Rock and a flotation mill at Rosiclare and produced fluorspar, lead, and zinc concentrates. The company curtailed operations during the summer because of depressed market conditions. Also, the company began to treat mine-run ore by heavy-medium separation on a small scale, prior to flotation.

Mackey-Humm Mining Co. operated its mine and heavy-medium and flotation plants. Metallurgical-grade fluorspar was produced in the heavy-medium plant, which also upgraded ore for other producers. Acid-grade fluorspar was produced in the company flotation plant. Acid-grade fluorspar also was produced at the flotation plant of Rosiclare Lead & Fluorspar Mining Co., which was operated only part of the year. Several companies mined fluorspar ore that was processed by other companies. Wiley Cochran began production from a new mine in the Karbers Ridge area.

Crushed and broken limestone was produced near Cave-in-Rock and Elizabethtown for roadstone, agricultural use, and metallurgical flux. The State highway department contracted for crushed limestone for road use.

**Henry.**—Schuler Coal Co. produced coal from an underground mine near Alpha. Most of the shipments to consumers were by rail.

McCarthy Improvement Co. opened a new limestone quarry near Cleveland. The company operated a portable crushing plant and produced material for roadstone and agricultural purposes.

Paving gravel was produced by Collinson Bros., who operated a portable plant near Kewanee. Schadt Service Co. operated a fixed sand and gravel plant near Silvis. Output was for building and road construction and other uses.

**Jackson.**—Coal production exceeded 1.3 million tons, 6 percent greater than in 1959. Truax-Traer Coal Co. operated its Burning

Digitized by Google

Star strip and underground mines and preparation plant near Elkville. The drift entrance of the Truax-Traer Coal Co. underground mine ceased production at the close of 1960. During the latter part of the year, the company was engaged in constructing an opening of a new slope mine several miles away. Elk Coal Co. operated an underground mine and preparation plant near Elkville. Farley Bros. Coal Co. produced coal from a strip mine near DeSoto.

Crushed limestone for agricultural and road purposes was produced near Ava by the Illinois Quarry Co.

Lawder Sand Co. produced sand and gravel near Grand Tower for building and road construction, railroad ballast, and other uses.

**Jefferson.**—Coal was produced by Freeman Coal Mining Corp. from the Orient No. 3 mine near Waltonville and by Belle Rive Mining Co., operating a strip mine near Belle Rive. Total production decreased 6 percent from 1959. The Orient No. 3 was the fourth largest producing mine in the United States in 1960. Output from the mine was cleaned, using jigging, tabling, and heavy-medium methods.

Crushed limestone for road use was produced near Mount Vernon by the Randall Stone Co.

**Jo Daviess.**—Four companies mined lead and/or zinc ores. Eagle-Picher Co. operated its Graham-Snyder-Spillane-Feehan and O'Rourke mines and Graham mill throughout the year except for a strike that lasted all of October. In July, the company reduced operations from 6 to 5 days a week with one shift per day, because of reduced sales of zinc. Ore mined by the company in Wisconsin was processed at the Graham mill. Tri-State Zinc Co. operated its Gray and Amelia mines, and treated ore from both mines at the company Gray mill. Hickory Hill Mining Co. and Little Ginte Mining Co. produced lead ore from the Hartwick and Little Ginte mines, respectively. The ore was processed at plants of other companies.

Broege Limestone Co. and Elmer Wienen & Sons produced crushed limestone for roadstone and agricultural purposes. The Midland Co. produced crushed limestone for use as railroad ballast. The State highway department contracted for roadstone.

Dubuque Sand & Gravel Co. operated a fixed plant at East Dubuque and produced material for building and other purposes.

**Kane.**—Sand and gravel was produced by 9 companies, operating fixed and portable plants at various locations. Output was for building and road construction, fill, and other uses. Sand and gravel for paving was produced by the city of Aurora, and under contract for the State highway department. An article describing the East Dundee sand and gravel plant of Material Service Corp. was published.[9] A report on the sand and gravel resources of the county also was published.[10]

Conco-Western Stone Co. and Fox River Stone Co. produced limestone near North Aurora and Elgin, respectively. Both companies operated portable crushing plants. Output was used for concrete aggregate and roadstone, agriculture, flux, asphalt filler, flagging, and rubble.

---

Peat was produced, primarily for soil conditioning.

**Kankakee.**—Coal production increased substantially over that of 1959. The entire output came from a strip mine operated by Peabody Coal Co. near Braidwood. Production also was reported from the Will County portion of the mine.

Crushed limestone was produced by Lehigh Stone Co. and Manteno Limestone Co. Output was for agricultural and road purposes and railroad ballast.

Clay mined near Kankakee and St. Anne was used for manufacturing building brick and other heavy clay products. Producers were Eastern Illinois Clay Co., Kankakee Clay Products Co., and St. Anne Brick & Tile Co.

Paving sand was produced near Kankakee by the Azzarelli Construction Co. and Kankakee Sand Co. The National Silica Division of Portage-Manley Sand Co. produced molding sand.

**Knox.**—Over 2.2 million tons of coal was produced in Knox County, a slight increase over 1959. Output came from the Rapatee No. 3 and Middle Grove No. 2 mines of Midland Electric Coal Corp., the Victoria No. 5 mine of Midland Collieries, Inc., and the Little John mine of Stonefort Coal Mining Co., Inc. All were strip mines. The Little John mine was abandoned in April. Production from the Victoria No. 5 was cleaned at the Bureau County plant of Midland Electric Coal Corp. Virtually the entire county coal output was shipped to consumers by rail.

Crushed limestone for roadstone and agriculture was produced near Abingdon by the Abingdon Rock Co., Inc.

Paving gravel was produced under contract for the State highway department by Knox County Gravel Co.

Abingdon Potteries, Inc., operated a feldspar-grinding plant at Abingdon. Crude material processed was mined by the company outside the State. The ground product was used entirely in manufacturing pottery.

**Lake.**—Nine companies produced sand and gravel near Antioch, Barrington, Gurnee, Ingleside, Libertyville, Spring Grove, and Wadsworth. Output was for building and road construction, railroad ballast, and other uses. Paving gravel was produced under contract for the county highway department.

The National Brick Co. produced clay near Deerfield and used the material for manufacturing building brick.

Peat produced in the county was used principally for soil conditioning.

Coke was produced at Waukegan by General Motors Corp.

Lake Zurich Concrete Products Co. expanded perlite at its plant in Lake Zurich from crude material mined in Colorado and New Mexico. Output was used as lightweight aggregate in plaster and concrete.

National Gypsum Co. manufactured gypsum products at Waukegan. Crude gypsum processed was mined by the company in Michigan.

**La Salle.**—La Salle County ranked first in value of mineral output (excluding liquid fuels and natural gas). Portland and masonry

Digitized by Google

cements were produced by Alpha Portland Cement Co. at La Salle and by Lehigh Portland Cement Co. and Marquette Cement Mfg. Co., at Oglesby. All three companies quarried limestone for use in manufacturing cement. Crushed limestone also was produced for agriculture and roadstone near Sheridan, Troy Grove, and Utica. The State highway department contracted for roadstone.

Alpha Portland Cement Co. and Marquette Cement Mfg. Co. produced shale for their own use in manufacturing cement. Material Service Corp. produced shale near Ottawa for use in manufacturing lightweight aggregate at its plant on the Illinois River. Several sizes of aggregates were produced, using 2 rotary kilns. Products were shipped by rail and river barge. Conco-Meier Co. and Hydraulic-Press Brick Co. mined clay near Lowell and Utica, respectively, and used the material for manufacturing building brick. LaClede-Christy Co. produced fire clay near Ottawa for use in manufacturing firebrick. Fire clay also was produced by Illinois Valley Minerals Co., and sold to steel mills for refractory use. Matthiessen & Hegeler Zinc Co. ceased mining fire clay in 1959. The company had formerly used the material for manufacturing zinc retorts for its zinc smelter at La Salle.

Sand and gravel was produced by 15 companies. Output was for building and road construction, railroad ballast, fill, and special uses such as glass manufacture, molding, grinding and polishing, sandblasting, engine use, filtering, oilfield fracturing, filler, enamel, and foundry use. Producers of silica sands included The American Silica Sand Co., Inc.; The Arrowhead Co.; E. C. Bellrose Sand Co.; Illinois Silica Sand Co.; Ottawa Silica Co.; and Wedron Silica Co. Paving gravel was produced under contract for the State highway department.

**Lee.**—The Medusa Portland Cement Co. produced portland and masonry cements at Dixon, and mined limestone and clay for use in manufacturing cement. The company announced plans for a major expansion and modernization program, including a 1 million-barrel addition to the annual capacity of its Dixon plant. A new kiln was expected to be put into operation in 1961.

Crushed limestone also was produced by Frank N. Butler Co., Oregon Stone Quarries, Stoneridge Limestone Co., and Wastone, Inc., all of whom operated portable crushing plants. Output was for roadstone and agricultural purposes.

Sand and gravel was produced by several companies near Dixon and Steward for building and road construction and fill.

**Livingston.**—Crushed limestone was produced near Chenoa, McDowell, and Pontiac. Output was for roadstone, agriculture, asphalt filler, and other purposes. Producers included Chenoa Stone Co., Livingston Stone Co., Ocoya Stone Co., Pontiac Stone Co., and Wagner Stone Co.

Hydraulic-Press Brick Co. mined clay near Streator and used the material for manufacturing building brick. Streator Clay Pipe Co., formerly Streator Drain Tile Co., also produced clay near Streator, chiefly for manufacturing sewer pipe. The company mined less than 1,000 tons of coal in conjunction with its clay-pit operation and used

Digitized by Google

the coal in its manufacturing process. Diller Tile Co., Inc., produced clay near Chatsworth for use in manufacturing building brick.

Paving gravel was produced.

**Logan.**—Sand and gravel for building and road construction, engine use, and fill was produced at a dredging operation of Lincoln Sand & Gravel Co. near Lincoln.

Crushed limestone for agriculture and roads was produced by Rocky Ford Limestone Co. from a quarry several miles southwest of Lincoln.

Over 17,000 tons of coal was produced from an underground mine near Lincoln. The mine was operated by Lincoln Coal Mining Co. until September 20, when McSpadden Bros. acquired the property. The latter company then operated the mine to yearend. The entire output was sold for local consumption.

**Macoupin.**—The sole producer of coal was the Little Dog Coal Co., operating an underground mine at Gillespie. Most of the 358,000 tons produced was sold locally. The entire output was cleaned by jigging and tabling.

Crushed limestone was produced under contract for the State highway department for use as roadstone.

International Vermiculite Co. exfoliated vermiculite at Girard from crude material mined outside the State. Output was used chiefly for insulating purposes.

**Madison.**—Coal was produced from 2 underground mines, operated by Livingston-Mt. Olive Coal Co. and Lumaghi Coal Co. near Livingston and Collinsville, respectively.

Limestone was produced by C. M. Lohr, Inc., Reliance Whiting Co., and Mississippi Lime Co. near Alton and Godfrey. The latter operated an underground mine, whereas the other companies operated open quarries. Output was for roadstone, agriculture, riprap, and other purposes. The State highway department contracted for roadstone.

Sand and gravel was produced near Alton and Granite City for building and road construction and engine and other uses. Producers included Alton Sand Co., Guth Sand Co., Gary Dredging Co., and Mississippi Lime Co. The latter two companies operated dredges near Alton.

No clay was produced in 1960, the Alton Brick Co. having ceased mining operations. Western Fire Brick Co. manufactured firebrick from clay produced in Missouri, in a plant at Granite City. Sandstone produced by the company in Alexander County was shipped to the Granite City plant, crushed, and used for patching furnaces.

Coke ovens and blast and steel furnaces were operated at Granite City by Granite City Steel Co. In 1960 the company dismantled its old B furnace, which was to be replaced with a new and larger furnace. Construction of the new furnace, with a daily capacity of about 1,800 tons of pig iron, was nearly completed at yearend. To support the expanded blast-furnace capacity, the company planned to construct a battery of 61 coke ovens which was expected to increase the company coking capacity about 80 percent. LaClede Steel Co. also produced steel in the county, operating open-hearth furnaces at Alton.

Digitized by Google

The Anlin Company of Illinois recovered sulfur from refinery gases at its new plant at Hartford.

**Marshall.**—Clay used in manufacturing building brick was produced by Hydraulic-Press Brick Co. near Sparland.

Paving gravel was produced by Vernon Henry, operating a portable plant near LaRose.

**McDonough.**—Crushed and broken limestone was produced near Colchester by Colchester Stone Co. and McClure Quarries, Inc. Output was for roadstone, riprap, and other purposes.

Clay was produced by 6 companies from pits near Colchester and Tennessee. Output was used in manufacturing pottery, stoneware, firebrick, building brick, sewer pipe, and other heavy clay products.

**McHenry.**—Sand and gravel was produced by 12 companies, operating portable and stationary crushing plants near Algonquin, Crystal Lake, Hebron, McHenry, Marengo, and Wauconda. Output was for building and road construction and other purposes. Major producers included Consumers Co., Material Service Corp., McHenry Sand & Gravel Co., and Tonyan Bros., Inc.

Garden Prairie Stone Co., Inc., produced limestone near Marengo for roadstone, agriculture, and flagging. The company also produced paving gravel.

**Menard.**—Limestone was produced near Athens by Athens Stone Quarry and Indian Point Limestone Products Co., Inc. Output was for roadstone, agriculture, and riprap.

The only coal producer was Wilcox-Verna Coal Co., Inc., operating an underground mine near Petersburg. The entire output of 13,000 tons was for local consumption. The underground mine formerly operated by Lloyd Coal Co. had been abandoned late in 1959.

Clay was mined near Petersburg by Springfield Clay Products Co., who used the material for manufacturing building brick and other heavy clay products.

**Mercer.**—Coal was produced from an underground mine operated near Alpha by Hazel Dell Coal Corp. and from a strip mine, operated by Viola Coal Co., near Viola. Approximately one-third of the county output was shipped by rail. The remainder was sold locally.

Crushed limestone for roadstone was produced by Linn Materials, Inc., near Viola.

Hydraulic-Press Brick Co. mined clay near Aledo for use in manufacturing building brick.

**Montgomery.**—Over 1.9 million tons of coal was produced from the Crown underground mine, operated by Freeman Coal Mining Corp. near Farmersville. Production increased 19 percent over 1959. The entire output was cleaned by jigging and pneumatic methods.

Crushed limestone was produced by several companies near Litchfield and Nokomis. The material was used for roadstone, agriculture, and riprap.

**Peoria.**—Over 433,000 tons of coal was produced from 7 strip and 3 underground mines, a 34-percent increase over 1959. Chief reason for the increase was the full-scale operation of The United Electric Coal Cos. Banner No. 27 strip mine near Glasford, which extends into Fulton County. Layne's Coal Co. opened a new strip mine near Brimfield. Three cleaning plants were operated. About one-fourth of the

Digitized by Google

county output was shipped by barge on the Illinois River. The remainder was sold locally.

Six companies produced sand and gravel near Chillicothe and Peoria for building and road construction, railroad ballast, and other uses.

Crushed limestone for roadstone and agriculture was produced near Princeville by LaMar Stone Co., Long Rock Co., and Princeville Stone Co.

**Perry.**—Approximately 2.8 million tons of coal was produced, a decrease of 19 percent from 1959. Output was from two strip mines, operated by Truax-Traer Coal Co. and The United Electric Coal Cos., and an underground mine operated by Big Five Coal Co. The latter mine was abandoned in March, after the shaft caved. Cleaning plants were operated by Truax-Traer Coal Co. and The United Electric Coal Cos.

**Pope.**—Egyptian Mining Co., Redd Mining Co., and J. W. Patton & Sons operated fluorspar mines. The crude ore was processed at plants in Hardin County and in Kentucky. Zinc was recovered from ore mined by J. W. Patton & Sons. The Empire mine of the Egyptian Mining Co. was closed after it was flooded early in the year.

Paving gravel was produced by Madeker Gravel Pit and the county highway department and also under contract for the State highway department.

**Pulaski.**—Crushed and broken limestone was produced by Columbia Quarry Co. near Ullin. Output was for roadstone, railroad ballast, riprap, and agriculture. Medusa Portland Cement Co. acquired additional limestone deposits in an area regarded as a potential site for a new cement plant.

Star Enterprises, Inc., mined clay near Olmstad and sold the material for absorbent uses and as a filler for fertilizers and insecticides.

The State highway department purchased paving sand and gravel from several companies.

**Randolph.**—Over 1.7 million tons of coal was produced from 2 strip mines, operated by Ritter Coal Co. and Southwestern Illinois Coal Co., and an underground mine, operated by Zeigler Coal & Coke Co. The latter two companies operated cleaning plants. The Ritter Coal Co. mine was closed until August.

Limestone was produced from 3 underground mines near Chester and Prairie du Rocher. Output was used chiefly for roadstone, agriculture, and in alkali works.

Sand for building and road construction, engine use, and fill was produced by Southern Illinois Sand Co. at a dredging operation near Chester.

**Rock Island.**—Crushed limestone was produced by Allied Stone Co., Collinson Stone Co., Cordova Quarry, Inc., and Midway Stone Co., Inc., for agricultural and road purposes. Sand and gravel was produced by five companies for building and road construction and other uses.

The Flintkote Co. produced clay near Carbon Cliff and used the material for manufacturing flue liners.

Digitized by Google

**St. Clair.**—Ranking third in 1960, coal production was more than 4.8 million tons, 8 percent below that of 1959. A 6-percent gain in strip-mine production did not offset a substantial decrease in output from underground mines. Virtually the entire county coal output was cleaned at eight preparation plants. Major producers were Peabody Coal Co. and Mid-Continent Coal Corp. Peabody abandoned its Seminole strip mine and its St. Ellen underground mine in May. The company also began using a new 9-bucket wheel excavator for stripping overburden at its River King mine, the tenth largest producing mine, and the fifth largest producing strip mine, in the United States in 1960. East Side Coal Co., Inc., abandoned its underground mine near Freeburg in May.

Limestone was produced for roadstone, agriculture, riprap, rubble, and other uses. Producers included Columbia Quarry Co., East St. Louis Stone Co., Hecker Quarry, Inc., Quality Stone Co., and Casper Stolle Quarry & Construction Co. In July the Quality Stone Co. opened a new quarry near Hecker.

Missouri-Illinois Materials Co. produced sand near East St. Louis for building and road construction and engine and other uses. The city of Belleville and the State highway department contracted for paving sand and gravel.

Hydraulic-Press Brick Co. produced clay near East St. Louis for use in manufacturing lightweight aggregate. Hill Brick Co. mined clay near Belleville and used it for manufacturing building brick.

American Zinc Co. of Illinois operated primary zinc reduction plants at Fairmont City and Monsanto. The Monsanto plant was closed for a 2-week period in the summer for major repairs.

C. K. Williams & Co. ground barite mined outside the State, at East St. Louis. The ground product was sold for paint and rubber filler and pharmaceuticals.

The Aluminum Company of America produced aluminum fluoride, gallium, and synthetic cryolite at its East St. Louis plant.

**Saline.**—Coal production increased 15 percent over 1959. Output of nearly 3 million tons was from 8 strip and 2 underground mines. Principal producers were Sahara Coal Co., Inc., and Saxton Coal Corp. Both companies also operated cleaning plants, using jigs. Approximately 91 percent of the county production was shipped to consumers by rail and 7 percent by water. The remainder was shipped by truck. New strip mines were opened by Marshall Equipment Co. and New Oak Hill Coal Co.

**Sangamon.**—Sand and gravel was produced near Springfield by Buckhart Sand & Gravel Co., Inc., Clear Lake Sand & Gravel Co., and Springfield Sand & Gravel Co. Output was for building and road construction and other uses. An article describing the operation of the Springfield Sand & Gravel Co. was published.[11] The city of Springfield contracted for paving sand and gravel.

Coal for local consumption was produced by Cantrall Coal Co. and Eddy Coal Co. from underground mines near Cantrall. Output decreased 5 percent from 1959.

---

[11] Rock Products, Problem: Tough Market; Solution: Build a New Plant: Vol. 63, No. 7. July 1960, p. 90.

Digitized by Google

Poston Brick & Concrete Products Co. produced clay near Springfield, chiefly for manufacturing building brick and lightweight aggregate. Springfield Clay Products Co. mined clay near Springfield for use in manufacturing draintile and floor and wall tile.

The State highway department contracted for roadstone.

**Schuyler.**—Approximately 594,000 tons of coal was produced, a 21-percent decrease from 1959. Output came from the Key strip mine of Peabody Coal Co. and an underground mine operated by D. & D. Coal Co. Nearly 99 percent of the production was from the Key mine. Peabody Coal Co. also operated a preparation plant at the Key mine. Over 89 percent of the total production was shipped by barge on the Illinois River, 9 percent by rail, and the remainder by truck.

Crushed limestone for roadstone and agricultural use was produced near Rushville by Elas Quarry.

**Stark.**—Stonefort Coal Mining Co., Inc., formerly Stonefort Corp., began coal production from its new Allendale strip mine near Wyoming in April. Over 170,000 tons was produced and the entire output was cleaned by jigging. Shipments to consumers were all by rail.

The county highway department produced paving sand near Toulon.

**Tazewell.**—Sand and gravel for building and road construction, railroad ballast, and other purposes was produced from plants near East Peoria, Mackinaw, and Washington. Producers were Hoffer Construction Co., McGrath Sand & Gravel Co., Inc., and C. A. Powley Co.

Peoria Brick & Tile Co. produced clay near East Peoria and used the material for manufacturing building brick.

**Vermilion.**—Coal was produced from 5 strip and 3 underground mines, all near Danville. Total production, 1.1 million tons, was 10 percent lower than in 1959. Strip mines furnished 96 percent of the total. Major producers were Fairview Collieries Corp. and The United Electric Coal Cos. Cleaning plants were operated by Fairview Collieries Corp. and the V-Day Coal Co. Lee Coal Co. opened a new strip mine. O'Neil Bros. Construction Co. abandoned its strip mine, formerly operated by Doo-Little Coal Co.

Material Service Corp. produced crushed limestone for roadstone at its Fairmount quarry.

Clay was mined by the Western Brick Co. near Danville. The material was used by the company for manufacturing building brick and lightweight aggregate.

Sand and gravel was produced by 6 companies, operating portable and fixed plants near Alvin, Danville, and Westville. Output was for road construction, fill, and other purposes.

**Wabash.**—Sand and gravel was produced near Allendale, Bellmont, and Mount Carmel. Producers were Allendale Gravel Co., Dunbar Sand & Gravel Co., and Mt. Carmel Sand & Gravel Co. Paving sand and gravel was produced under contract for the State highway department.

Approximately 1,100 tons of coal for local consumption was produced by Allendale Coal Co. from a strip mine near Allendale.

Digitized by Google

**Washington.**—Crushed limestone for roadstone and agricultural use was produced near Radom by Pitts Quarry.

Nearly 33,000 tons of coal was produced from underground mines operated by Bois Coal Co. near DuBois and Venedy Coal Co., Inc., near Venedy. Approximately one-fourth the total output was shipped by rail. The remainder was sold locally.

**Will.**—Sand and gravel was produced for building and road construction, railroad ballast, and other uses. Producers included Avery Gravel Co., Chicago Gravel Co., Elmhurst-Chicago Stone Co., Material Service Corp., C. H. Monk, and Peabody Coal Co. The State highway department contracted for paving sand and gravel.

Crushed limestone was produced for roadstone, railroad ballast, agriculture, riprap, flux, and other metallurgical purposes. Operating companies were Elmhurst-Chicago Stone Co., Lincoln Stone Co., Material Service Corp., and National Stone Co. Crushed limestone also was produced by the Illinois State Penitentiary.

Nearly 369,000 tons of coal was produced from the Will County portion of the Northern Illinois strip mine, operated by Peabody Coal Co. The mine extended into Kankakee County. The entire output was cleaned by jigging methods. Approximately half the total production was shipped to consumers by rail.

Johns-Manville Perlite Corp. processed crude perlite and vermiculite at Joliet. The crude material was mined in western States. Expanded perlite was sold for use as lightweight aggregate in plaster and concrete and other purposes; exfoliated vermiculite was used for manufacturing insulating material.

**Williamson.**—Williamson County ranked first in coal production with an output of nearly 6.3 million tons, an increase of 2 percent over 1959. Thirteen underground mines furnished 64 percent of the production. The remainder was from 9 strip mines. Major producers included Bell & Zoller Coal Co., Carmac Coal Co., Forsyth Carterville Coal Co., Freeman Coal Mining Corp., Peabody Coal Co., Stonefort Coal Mining Co., Inc., and Utility Coal Co. Over 6 million tons of coal was cleaned at 12 preparation plants. Approximately 96 percent of the output was shipped by rail. The underground mine of Blue Blaze Coal Co. near Carterville and several relatively small strip mines were abandoned in 1960.

# The Mineral Industry of Indiana

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Geological Survey, Indiana Department of Conservation.**

By Donald F. Klyce [1] and Mary B. Fox [2]

VALUE of mineral production in Indiana in 1960 was slightly higher than in 1959. Variations were small in both output and value of most commodities. The most notable change was the decline in demand for dimension limestone, particularly dressed building stone. Coal shipments were substantially larger, but the weighted average value per ton decreased from $4.05 in 1959 to $3.96. A similar change was noted in the price of petroleum which declined from $2.97 to $2.94 a barrel.

Plans for constructing a new cement plant at Logansport were announced in October by Louisville Cement Co. A large industrial development in the dunes area of northern Indiana was still under consideration, although differences between conservationists and business development leaders remained to be resolved. Completion of the development would have a positive effect on the mineral economy of the State as substantial quantities of mineral materials would be required for construction and operation of the heavy industries proposed for the area.

**TABLE 1.—Mineral production in Indiana [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Abrasives (whetstones)—short tons | 5 | $13 | (W) | (W) |
| Cement, portland—thousand 376-pound barrels | 14,245 | 47,231 | 14,052 | $48,310 |
| Clays—thousand short tons | 1,692 | 2,915 | 1,822 | 3,396 |
| Coal—do | 14,804 | 59,954 | 15,538 | 61,570 |
| Natural gas—million cubic feet | 484 | 92 | 342 | 61 |
| Peat—short tons | 15,393 | 202 | 27,486 | 290 |
| Petroleum (crude)—thousand 42-gallon barrels | 11,554 | 34,315 | [3] 11,590 | [3] 34,075 |
| Sand and gravel—thousand short tons | 20,357 | 17,924 | 20,752 | 18,377 |
| Stone—do | 18,544 | 37,682 | 18,956 | 34,920 |
| Value of items that cannot be disclosed: Masonry cement, gem stones (1960), gypsum, and values indicated by footnote 2 | | 8,817 | | 8,569 |
| Total Indiana [4] | | 206,359 | | 206,882 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Figure withheld to avoid disclosing individual company confidential data.
[3] Preliminary figure.
[4] Total adjusted to eliminate duplicating value of clays and stone.

**Employment and Injuries.**—Preliminary information indicated that man-hours worked in the mineral industries in 1960 were slightly higher than in 1959, closely following the production trend. The largest increase was noted in the coke industry, which reflected recovery from the prolonged steel strike in 1959.

Five fatalities were recorded, compared with eight in 1959.

All employment and injury data for the mineral industry in Indiana with the exception of coal were collected from companies on a voluntary basis. Data represents virtually complete reporting by cement, coal, and coke producers and a high percentage of clay, sand and gravel, and stone producers.

**TABLE 2.—Employment and injuries for selected mineral industries [1]**

| Year and industry | Average number of men working | Total man-hours | Total number of disabling injuries | | Total number of days lost or charged | Injury frequency rate [2] | Injury severity rate [3] |
|---|---|---|---|---|---|---|---|
| | | | Fatal | Non-fatal | | | |
| 1959: | | | | | | | |
| Cement [4] | 1,549 | 4,011,792 | ---- | 9 | (5) | 2.24 | (5) |
| Clays [6] | 651 | 1,540,201 | 1 | 32 | 6,474 | 21.42 | 4,203 |
| Coal | 3,707 | 5,973,788 | 4 | 269 | 40,051 | 45.70 | 6,705 |
| Coke ovens | 1,970 | 5,020,516 | ---- | 15 | (5) | 2.99 | (5) |
| Limestone [7] | 2,931 | 5,759,304 | 3 | 212 | (5) | 37.33 | (5) |
| Marl | 23 | 24,870 | ---- | ---- | ---- | ---- | ---- |
| Sand and gravel | 1,152 | 2,372,164 | ---- | 36 | 1,107 | 15.18 | 467 |
| Sandstone | 123 | 268,182 | ---- | 21 | (5) | 78.30 | (5) |
| 1960: [8] | | | | | | | |
| Cement [4] | 1,390 | 3,720,220 | ---- | 4 | (5) | 1.08 | (5) |
| Clays [6] | 721 | 1,245,109 | ---- | 36 | 387 | 28.91 | 311 |
| Coal | 3,548 | 5,925,303 | 4 | 276 | 35,439 | 47.25 | 5,981 |
| Coke ovens | 2,120 | 6,167,387 | ---- | 10 | (5) | 1.62 | (5) |
| Limestone [7] | 2,656 | 5,210,876 | ---- | 126 | (5) | 24.18 | (5) |
| Marl | 25 | 25,440 | ---- | ---- | ---- | ---- | ---- |
| Sand and gravel | 1,184 | 2,457,244 | ---- | 38 | 885 | 15.46 | 360 |
| Sandstone | 96 | 152,380 | 1 | 4 | (5) | 32.81 | (5) |

[1] Excludes officeworkers.
[2] Total number of injuries per million man-hours.
[3] Total number of days lost or charged per million man-hours.
[4] Includes cement plants and quarries or pits producing raw material used in manufacturing cement.
[5] Data not available.
[6] Excludes pits producing clay used exclusively in manufacturing cement.
[7] Excludes quarries producing limestone used exclusively for manufacturing cement.
[8] Preliminary figures.

# REVIEW BY MINERAL COMMODITIES

## NONMETALS

**Abrasive Materials.**—Whetstones from sandstone quarried near Orleans in Orange County were manufactured by The Hindostan Whetstone Co. of Bedford.

Most of the mill output consisted of small tapered stones used for removing fingernail cuticle and was marketed through beauty supply houses. Sharpening stones also were fabricated.

Whetstones have been produced in this area since 1812 and the sharpening stone industry was one of the earliest mineral developments in Indiana. The stone is quarried from beds just above the Mississippian-Pennsylvanian unconformity. The material consists of

Digitized by Google

quartz grains less than one-eighth millimeter in diameter bonded by iron oxide and clay.

**Cement.**—Four cement plants (Lehigh Portland Cement Co. at Mitchell, Lone Star Cement Corp. at Limedale, Louisville Cement Co. at Speed, and Universal Atlas Cement Co. at Buffington) produced portland and masonry cements. The average mill values of portland and masonry cements increased from $3.32 and $3.44 in 1959 to $3.44 and $3.75 per barrel, respectively. As a result, value of shipments in 1960 was higher than in 1959, although volume decreased 450,000 barrels. Stocks of portland cement at mills at yearend were 2 percent lower than in 1959.

Shipments of portland cement went chiefly to ready-mixed concrete companies, concrete product manufacturers, building material dealers, and highway contractors. About 42 percent of the cement shipped was used in Indiana. Out-of-State shipments went mainly to Illinois, Kentucky, and Wisconsin.

Over 3 million tons of limestone and large quantities of slag, clay, gypsum, and sand were used in making cement. More than 345 million kilowatt hours of electrical energy was used at the cement plants.

Alumina cement was produced by Universal Atlas Cement Co.

In addition to plans for the projected Logansport plant, Louisville Cement Co. completed a new finish-grinding department at its Speed plant, which included a two-compartment 10- by 34-foot mill.

Lehigh Portland Cement Co. continued rebuilding its Mitchell plant, which when completed will result in virtually a new operation with increased capacity of 700,000 barrels. Two kilns, completed in 1959, were in operation during the year. Five mills (two raw and three finish) were being installed, and cement storage silos and a storage building were being built.

The Indiana Geological Survey provided the Portland Cement Association with samples of carbonate rocks of Indiana to assist in the Association's research program on alkali reactivity of carbonate rocks—expansion and dedolomitization.

**Clays.**—Fire clay was produced in seven counties and used for stoneware, floor and wall tile, architectural terra cotta, art pottery, firebrick and block, heavy clay products, art products, and for "daubing" coke ovens.

Miscellaneous clay was mined in 21 counties. The material was used in heavy clay products (building and paving brick, draintile, sewer pipe), cement, lightweight aggregate, stoneware, and plastics.

Increased clay production reflected a greater demand from manufacturers of heavy clay products and lightweight aggregate, which more than offset a drop in demand for clay for use in cement.

Figures compiled by the Indiana Geological Survey indicated that the value of products manufactured from clay and shale totaled $25,860,486, a decrease of 13 percent from the 1959 value. Although many companies reported decreases in income for the year, a large part of the total decrease indicated for the State must be attributed to the fact that some companies did not submit reports. Common and face brick and structural tile supplied about 45 percent of the total value of manufactured clay products, draintile and sewer pipe, 26

615629—61——25

Digitized by Google

percent; vitreous china plumbing fixtures, pottery, and art products, 28 percent, and miscellaneous items, the remainder.

**TABLE 3.—Clays sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Fire clay | | Miscellaneous clay | | Total | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951-55 (average) | 477 | $888 | 1,160 | $1,524 | 1,637 | $2,412 |
| 1956 | 645 | 1,202 | 1,405 | 2,255 | 2,051 | 3,457 |
| 1957 | 398 | 748 | 1,077 | 1,821 | 1,475 | 2,569 |
| 1958 | 315 | 518 | 1,056 | 1,959 | 1,371 | 2,477 |
| 1959 | 366 | 565 | 1,326 | 2,350 | 1,692 | 2,915 |
| 1960 | 348 | 635 | 1,474 | 2,761 | 1,822 | 3,396 |

The Indiana Geological Survey published [3] a directory of producers and users of clay and shale in Indiana.

**Gem Stones.**—Calcite specimens were found at a quarry near North Vernon in Jennings County. Total output of gem stones, however, was negligible in value compared with that of other mineral commodities.

**Gypsum.**—Gypsum was mined in Martin County by National Gypsum Co. and United States Gypsum Co. Output was larger than in 1959. Mills at the mine sites produced lath, wallboard, prepared plaster, and other products.

The gypsum was mined from the lower part of the St. Louis limestone at depths of approximately 450 feet. The gypsum was mined by the room and pillar method from a face about 14 feet high, by drilling and blasting.

**Mineral Wool.**—Mineral wool was manufactured in plants in Huntington, Madison, Starke, Wabash, and Wayne Counties from blast-furnace slag obtained from steel mills in Lake County.

**Perlite.**—Crude perlite, mined in western States, was expanded at plants in Hammond (Lake County) and Scottsburg (Scott County). The processed material was used in building plaster, as concrete aggregate and insulation, and in other industrial materials.

**Sand and Gravel.**—Output of sand and gravel was about the same as in 1959 with only minor variations in use. Most of the material was used for building and highway construction and maintenance. A larger quantity of sand and gravel for use as fill was reported than in previous years. Commercial production was reported from 67 counties by 175 producers.

County highway departments in 13 counties reported production of sand and gravel, mostly for roads.

Major sand and gravel production came from Marion, Allen, Vigo, Kosciusko, and St. Joseph Counties. The 10 leading producers, in alphabetical order, were Allen-Whitley County Gravel Co., Inc., Columbia City; American Aggregates Corp., Indianapolis; Paul C. Brudi Stone & Gravel Co., Inc., Fort Wayne; Irving Bros. Gravel

[3] Harrison, J. L., Directory of Producers and Users of Clay and Shale in Indiana: Indiana Geol. Survey Directory No. 7, 1960, 38 pp.

Digitized by Google

Co., Inc., Marion; Irving Materials, Inc., No. 2, Fortville; May Stone & Sand, Inc., Fort Wayne; Neal Gravel Co., Inc., Covington; Portage-Manley Sand Co., Rockton, Ill.; Standard Materials Corp., Indianapolis; and Western Indiana Gravel Co., Lafayette.

A report on the gravels of Indiana was published.[4]

**TABLE 4.—Sand and gravel sold or used by producers, by classes of operations and uses**

(Thousand short tons and thousand dollars)

| Class of operation and use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Commercial operations: | | | | |
| Sand: | | | | |
| Molding | 455 | $646 | 420 | $578 |
| Building | 3,655 | 2,850 | 4,081 | 3,242 |

| Total sand and gravel | 363 | 161 | 550 | 275 |
| All operations: | | | | |
| Sand | 8,457 | 6,973 | 9,148 | 7,205 |
| Gravel | 11,900 | 10,951 | 11,604 | 11,172 |
| Grand total | 20,357 | 17,924 | 20,752 | 18,377 |

[1] Included with "Undistributed" to avoid disclosing individual company confidential data.
[2] Includes railroad ballast (1959), filter (1960), glass, and other construction and industrial sands.
[3] Less than $1,000.

**Slag.**—Slag was a byproduct of pig-iron production in Lake County blast furnaces. It was used as an ingredient in manufacturing cement, mineral wool, roofing granules, was expanded for lightweight aggregate, and crushed for use as aggregate.

**Stone.**—Limestone and sandstone were quarried, and 97 percent of the production was crushed for various uses, including raw material

[4] McGregor, D. J., Gravels of Indiana: Indiana Geol. Survey Rept. of Progress 17, 1960, 58 pp.

Digitized by Google

for cement, concrete aggregate, roadstone, filler, flux, railroad ballast, and agricultural limestone.

The output of stone was more than 400,000 tons larger than in 1959, but value declined 7 percent. The loss was due mainly to a $3.1 million decline in the value of shipments of dressed dimension stone. Although the production of crushed stone continued to increase, its low unit value could not compensate for the decreased output of the higher priced dimension stone.

Crushed limestone was produced in 41 counties. The largest output came from Clark, Putnam, Lawrence, Allen, Newton, Monroe, and Scott Counties. Major producers included Louisville Cement Co., May Stone & Sand, Inc., Mulzer Brothers, Newton County Stone Co., Inc., The Ohio & Indiana Stone Corp., and Standard Materials Corp.

Dimension limestone, quarried mainly in Lawrence and Monroe Counties, furnished 34 percent of the value of the limestone produced, but it represented only 3 percent of the output by weight.

**TABLE 5.—Limestone sold or used by producers, by uses**

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |

[1] 145 pounds per cubic foot.
[2] Includes limestone for filter beds (1959), flux, chemicals, whiting or whiting substitutes, asphalt filler, fertilizer, dust for coal mines, mineral food, mineral wool, and other miscellaneous uses.

**TABLE 6.—Calcareous marl production**

| Year | Number of producers | Short tons | Value | Year | Number of producers | Short tons | Value |
|---|---|---|---|---|---|---|---|
| 1951-55 (average) | 5 | 17,706 | $12,521 | 1958 | 7 | 60,196 | $39,637 |
| 1956 | 8 | 99,561 | 65,755 | 1959 | 8 | 62,589 | 39,979 |
| 1957 | 7 | 103,452 | 65,011 | 1960 | 9 | 56,406 | 38,389 |

Although an increasing proportion was sold as rough architectural block, most of the material was cut and finished by companies operat-

Digitized by Google

ing the quarries. In the Bloomington-Bedford area, 15 independent finishing mills reported purchases of dimension limestone for fabrication into dressed stone. Leading producers were Indiana Limestone Co. and Ingalls Stone Co. (Bedford), and Bloomington Limestone Corp., Empire Stone Co., B. G. Hoadley Quarries, Inc., Victor Oolitic Stone Co., and Woolery Stone Co., Inc. (Bloomington).

Sandstone was produced in four counties. It was quarried by Indiana Sandstone Co., Inc., and Springs Valley Sandstone Co., in Lawrence County; Hinkle Sandstone Co., in Monroe County; and French Lick Sandstone Co., Inc., in Orange County. General Refractories Co. quarried a quartz conglomerate in Martin County. Except for the latter, who used the material for silica brick, sandstone quarried was cut and dressed and used for building purposes.

A bulletin [5] was published on the petrography of Indiana sandstones.

Members of the Indiana Geological Survey worked with the American Society for Testing Materials on revised specifications for building limestone. The Survey also assisted the Public Building Service of the General Services Administration in resolving a difficulty caused by use of the term "crystalline limestone" in dimension stone specifications.

Calcareous marl was produced from pits in seven counties. The leading output came from Kosciusko, Steuben, and La Porte Counties. The material was sold for soil conditioning.

Roofing granules were produced from natural slag in the Hammond area by H. B. Reed & Co., Inc.

**Sulfur.**—Byproduct sulfur was recovered from crude petroleum at the Whiting refinery, American Oil Co. (Standard Oil Co. of Indiana). The Mathieson-Fluor process was used.

## MINERAL FUELS

**Coal.**—Production of coal increased 5 percent, but value of shipments rose at a lower rate because of a decrease in price from $4.05 per ton in 1959 to $3.96. Eighty-one mines were operated, one more than in 1959. Of these, 47 were strip mines and 34 were underground mines.

More than 11.5 million tons of coal was mechanically cleaned at 18 plants.

About 11.4 million tons of coal was moved by rail; 1.9 million tons by water; and 1.5 million tons by truck. Most of the remainder, was moved by tramways and conveyor.

Mining-equipment sales to Indiana coal producers included four continuous mining machines and seven gathering and haulage conveyors. More than 98 percent of the coal mined underground was mechanically loaded.

Electric utility companies were the leading consumers of Indiana coal, using 62 percent of the output. Coal was mined in 15 counties of which five (Greene, Pike, Sullivan, Vigo, and Warrick) supplied more than 82 percent of the State total.

The Federal Bureau of Mines reported on a study [6] of devices and methods used for testing and splicing 160-volt and 440-volt cables and for providing ground-fault protection for 440-volt circuits as developed and used by the electrical staff of the Tecumseh open-pit coal mine, Boonville.

**TABLE 7.—Bituminous coal production in 1960, by counties**

(Excludes mines producing less than 1,000 short tons)

| County | Number of mines operated | | Production (short tons) | | | Value |
|---|---|---|---|---|---|---|
| | Underground | Strip | Underground | Strip | Total | |
| Clay | 1 | 9 | 2,000 | 877,525 | 879,525 | $3,599,599 |
| Daviess | | 1 | | 38,771 | 38,771 | 200,768 |
| Dubois | 4 | | 18,050 | | 18,050 | 72,378 |

[1] Included with "Undistributed" to avoid disclosing individual company confidential data.

The Indiana Geological Survey published [7] a bulletin on the geology and coal deposits of the Brazil Quadrangle, Ind. A map published [8] by the Federal Geological Survey on the geology and coal deposits of the Switz City Quadrangle in Greene County was based on results of a study made in cooperation with the Indiana Geological Survey.

**Coke.**—During the year five coke plants with 2,191 ovens were operated. More than 11 million tons of coal was used to produce 8 million tons of coke valued at $156 million. Output was up 16 percent over 1959. Indiana ranked third in coke production in the Nation, led only by Pennsylvania and Ohio. Most metallurgical coal used in the coke oven was shipped from Kentucky and West Virginia. None was mined in Indiana. Most of the coke produced was used in Lake County blast furnaces.

**Peat.**—Peat was produced from bogs in Benton, Blackford, Grant, Hamilton, Marion, and Wells Counties.

TABLE 8.—Peat production

| Year | Number of producers | Short tons | Value | Year | Number of producers | Short tons | Value |
|---|---|---|---|---|---|---|---|
| 1951–55 (average) | 7 | 8,765 | $44,544 | 1958 | 5 | 12,106 | $144,974 |
| 1956 | 7 | 11,383 | 78,594 | 1959 | 5 | 15,393 | 202,094 |
| 1957 | 8 | 13,805 | 129,750 | 1960 | 7 | 27,486 | 290,338 |

**Petroleum and Natural Gas.**—The Indiana Geological Survey reported that drilling for oil and gas continued to increase. The number of wells drilled increased 18 percent over 1959, to 1,072. Of these, 678 were development wells, and 394 were wildcats, resulting in 288 oil producers, 9 gas producers, 15 new pools, 17 extensions, 2 additional pay zones, and 741 dry holes. In addition, 61 secondary wells were reported, consisting of 44 water-input or disposal wells, 12 oil wells, 4 gas storage wells, and 1 dry hole.

Approximately one-third of the oil was produced by secondary-recovery methods, about the same proportion as in 1959.

Exploratory drilling was carried on in 42 counties, but nine-tenths of the activity was concentrated in 10 counties in the southwestern part of the State. The greatest activity was in Spencer County (354 wells), Gibson (194 wells), Pike (108 wells), Posey (86 wells), Dubois (53 wells), Vanderburgh (49 wells), Warrick (35 wells), Knox (34 wells), Sullivan (33 wells), and Perry (23 wells).

Testing of the Ste. Genevieve limestone and sandstone formations of the Chester series accounted for an estimated 62 percent of the total drilling.

Extensions to pools were more significant than new-pool discoveries. A well drilled in Posey County extended the productive area of the Heusler Consolidated pool. Twelve new wells produced from the Waltersburg sandstone. Also in Posey County, six new wells in the Point pool extension produced from sandstone in the Aux Vases formation.

Eleven sub-Trenton tests wells were drilled in Delaware, Jennings, Owen, Wabash, Steuben, Jay, and Vermillion Counties.

The proved oil reserves on December 31 was 66,251,000 barrels, and the total liquid hydrocarbon reserve was 66,361,000 barrels.[9]

Samples and pertinent data from 5,476 Indiana wells and 360 out-of-State wells were listed in a publication.[10] These samples, together with those received since July 1958, were available for use by industrial representatives. Petroleum exploration maps, showing location and total depth of wells drilled in 17 counties in northern Indiana, and a map showing pipelines in Indiana also were issued.[11]

## METALS

**Aluminum.**—The smelter of the Aluminum Company of America at Yankeetown in Warrick County began limited production in June. At the company's Lafayette works, a large extrusion press was put into production, and at the Richmond works, construction of additional facilities for the production of closures was begun.

**Pig Iron and Steel.**—Plants in East Chicago (Inland Steel Co. and Youngstown Sheet and Tube Co.) and Gary (United States Steel Corp.) produced pig iron and steel. The American Iron and Steel Institute reported that production was substantially higher than in 1959, when the plants were shut down because of a 116-day steel strike. Output of pig iron was 8.4 million tons, up 27 percent; steel production increased to 13.8 million tons, up 19 percent over 1959. More than 6.2 million tons of coke and 3.1 million tons of limestone and dolomite were used at integrated steel plants.

United States Steel Corp. announced plans for new metallurgical laboratory facilities at the Gary Steel Works. An administration building, a control-center office building, and metallurgical testing and ceramics development laboratories were included. Plans also were announced for constructing a third galvanized steel sheet production line at the Gary plant, scheduled for operation in mid-1962.

## REVIEW BY COUNTIES

Production valued at more than $1 million, excepting petroleum and natural gas, was reported from each of 22 counties. About 57

Digitized by Google

percent of the State total came from nine counties: Clark, Lake, Lawrence, Monroe, Pike, Putnam, Sullivan, Vigo, and Warrick. These nine counties produced all or most of the State's output of cement, coal, and dimension stone. Mineral output was reported from all counties except Brown, Franklin, Jefferson, Ohio, and Union.

Although petroleum and natural gas production and value is included in the State total, a breakdown by counties is not available. Major production came from Gibson and Posey Counties, which would rank high if petroleum data could be included on a county basis.

**Adams.**—Limestone, clay, and sand and gravel were produced. The stone was quarried and crushed for use as road material and for agricultural purposes by John W. Karch Stone Co. near Bryant and by Meshberger Bros. Stone Corp. near Linngrove and Pleasant Mills.

Clay mined near Decatur by Krick Tyndall Co. of Findlay, Ohio, was used in manufacturing heavy clay products. A pit near Geneva yielded sand and gravel for building purposes.

**TABLE 10.—Value of mineral production in Indiana, by counties[1 2]**

| County | 1959 | 1960 | Mineral production in 1960 in order of value [2] |
|---|---|---|---|
| Adams | $525,033 | $492,908 | Stone, clays, sand and gravel. |

| Undistributed | 105,567,454 | 102,268,073 | |
| Total [4] | 206,359,000 | 206,882,000 | |

[1] Brown, Franklin, Ohio, and Union Counties did not report production.
[2] Natural gas and petroleum production not available by counties. Value included with "Undistributed."
[3] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[4] Total adjusted to eliminate duplicating value of clays and stone.

**Allen.**—May Stone & Sand, Inc., produced limestone and sand and gravel near Ft. Wayne. The limestone quarry, nearly 300 feet deep, was one of the deepest manmade excavations in Indiana. The material was crushed and sold for flux, concrete aggregate and roadstone, and agstone.

The Klopfenstein Tile Works at Grabill was idle and consequently did not operate its clay pit. The Bolyard Tile Co. at Monroeville also remained shut down during the year.

In addition to May Stone & Sand, Inc., sand and gravel pits and processing plants were operated by Paul C. Brudi Stone & Gravel Co., Ft. Wayne; Irving Gravel Co., Inc., Harlan; and W. W. Gravel Co., Inc., Roanoke. Building and road materials were produced.

**Bartholomew.**—Meshberger Stone Co., Inc., operated a limestone quarry and crushing plant near Columbus. The output was used for agriculture and road construction. The Driftwood Gravel Co., Inc., which formerly operated a pit and processing plant in the Columbus area, moved to a site near Edinburg in adjoining Johnson County.

**Benton.**—Moss peat was mined from a pit near Otterbein by Millburn Peat Co., Inc., of Chicago. The material was sold for horticultural purposes and soil conditioning.

Digitized by Google

Road gravel was produced from a pit near Fowler by Mt. Gilboa Gravel Co.

**Blackford.**—Inman Tile Co. mined clay near Hartford City for its own use. J & K Stone Co. of Muncie operated the Montpelier quarry and crushed the output for road use.

Hartford Peat and Gravel Co. produced reed and sedge peat from a bog near Hartford City.

**Carroll.**—Delphi Limestone Co. produced roadstone and agricultural limestone at its quarry and plant near Delphi. Sand and gravel for road use and building construction was produced near Cutler and Flora.

**Cass.**—Limestone was quarried and crushed near Keeport by France Stone Co. of Toledo, Ohio, and at Logansport by Cass County Stone Co. Most of the output was used as roadstone and agstone, although some fluxstone and railroad ballast were produced.

Sand and gravel for building use and fill was mined near Monticello.

Plans for constructing a cement plant at Logansport were announced by Louisville Cement Co.

**Clark.**—Louisville Cement Co. manufactured portland and masonry cements at Speed. It produced clay and limestone for its own use and sold limestone for riprap and roadstone.

Limestone was quarried and crushed at plants near Jeffersonville (Atkins Stone Co.), Sellersburg (Sellersburg Stone Co.), and Utica (Louisville Sand and Gravel Co.). Although some agstone was produced, the material was used mostly for road construction and maintenance.

Sand and gravel was mined in the Jeffersonville-Utica area and was used principally for building and road purposes.

**Clay.**—Coal was produced from nine strip mines and one underground mine. During the year, Brown Coal Co. abandoned its strip mine near Centerpoint; Dellacca Coal Co. abandoned its strip mine at Carbon; G & F Coal Corp. acquired the Lone Star Coal Co. strip mine at Brazil. The largest production was reported from the Chinook mine of Ayrshire Collieries Corp.

Fire clay and miscellaneous clay were mined and sold or used for manufacturing vitrified sewer pipe, art pottery, building brick, floor and wall tile, refractories, and heavy clay products.

Gravel pits near Poland and Carbon were operated for road material and fill.

**Crawford.**—Limestone was quarried and crushed at Marengo by Hy-Rock Products Co. and at Eckerty by Mulzer Bros. Most of the material was sold for use as roadstone and concrete aggregate.

**Decatur.**—Four limestone quarries and crushing plants were operated. Harris City Stone Corp., Greensburg, and New Point Stone Co., Batesville, reported the largest output. Most of the material was used for road construction and agricultural purposes.

**Delaware.**—In the Muncie area, materials for building and road construction were obtained from two limestone quarries and four sand and gravel pits. J & K Stone Co. and Muncie Stone & Lime Co. crushed stone for concrete aggregate and roadstone.

Digitized by Google

**Dubois.**—Fire clay and miscellaneous clays were mined at two sites near Huntingburg and used in manufacturing stoneware, fire brick, and building brick.

Production of coal was reported from four underground mines.

Sand and gravel was produced near Jasper.

**Elkhart.**—E. M. Ulmer & Son produced marl near Etna Green. It was used for soil conditioning.

Sand and gravel, mined at five places in the Goshen-Elkhart area, was used for building, paving, and fill.

**Fountain.**—Two strip coal mines were operated at Kingman and Wernick. The Kingman mine of Morgan Coal Co. was abandoned in April.

Clay was mined and used for manufacturing building brick and as a filler in plastics.

Sand and gravel pits near Covington and Kingman yielded building and paving materials and railroad ballast.

**Fulton.**—Marl was produced from a pit near Kewanna. In the Rochester area, building and road materials were obtained from four sand and gravel pits.

**Gibson.**—Princeton Mining Co. from the Kings Station mine and Somerville Coal Co. from the Somerville mine, mined coal underground.

Sand and gravel was mined in three places.

The county was a major producer of petroleum. Fields in Gibson County and adjoining Posey County supplied more than half the State output.

**Grant.**—A bog near Jonesboro yielded peat.

The Pipe Creek Stone Co. produced flagging, riprap, fluxstone, roadstone, railroad ballast, and agricultural limestone at a quarry near Sweetser.

Two sand and gravel pits in the Marion area produced material for building and paving.

**Greene.**—Seven strip and two underground coal mines were operated. The Airline, Linton, and Friar-Tuck strip mines were the leading producers. In September the Linton mine was abandoned. Ayrshire Collieries acquired the Friar-Tuck mine from Sherwood-Templeton Coal Co. during the year.

Clay for building brick was mined near Bloomfield, and fire clay was mined near Switz City.

Sand and gravel was produced near Bloomfield.

**Hamilton.**—Limestone was quarried and crushed near Noblesville by Stony Creek Stone Co., Inc. Nearly all the material was used in road construction.

Sand and gravel was produced at five places. Peat was produced from two bogs near Noblesville.

**Harrison.**—Two quarries near Corydon (Corydon Crushed Stone & Lime Co. and Mathes Stone Quarry) produced roadstone and agstone. Davis Crushed Stone and Lime Co. at DePauw produced poultry grit, railroad ballast, road material, and agricultural limestone.

**Howard.**—Yeoman Stone Co., Kokomo, produced house veneer and flagging as well as crushed stone used for concrete aggregate, roadstone, and agricultural purposes.

Digitized by Google

**Huntington.**—Draintile was manufactured from clay mined near Huntington at the plants of Majenica Tile Co. and Simpson Clay Works. Erie Stone Co., Toledo, Ohio, operated a quarry and plant at Huntington and produced fluxstone, roadstone, agstone, railroad ballast, and material for mineral wool.

Sand and gravel was mined near Andrews.

**Jackson.**—Three clay pits yielded material used in manufacturing cement, building brick, and heavy clay products.

Sand and gravel was mined at two places and used for building and paving.

**Jasper.**—In the Rensselaer area, a limestone quarry operated by W. C. Babcock Construction Co., Inc., produced road material and agricultural limestone. The Rensselaer Gravel Co. produced building and paving material.

**Jay.**—Rockledge Products, Inc., operated a limestone quarry and crushing plant at Portland and produced roadstone, concrete aggregate, and agricultural limestone. Paving sand was obtained from a pit near Bluffton.

**Jennings.**—Paul Frank, Inc., operated a limestone quarry and plant at North Vernon and produced roadstone and agstone. Calcite specimens were collected as gem material from a quarry near North Vernon.

**Knox.**—Coal was produced from one strip mine and two underground mines. Largest production was reported from the Enoco mine. Sand and gravel was obtained from three pits near Vincennes.

**Kosciusko.**—Output from four marl pits was sold for soil conditioning.

More than 750,000 tons of sand and gravel was mined from six pits. Most of the material was used for building and road construction. Engine sand, railroad ballast, and fill also were produced.

**Lagrange.**—Marl was obtained from a pit near Howe. Sand and gravel was produced at five places.

**Lake.**—Portland and masonry cements were manufactured at Buffington by Universal Atlas Cement Co. Raw materials included blast furnace slag from local steel mills and limestone brought by boat from Michigan quarries. Building brick was made from clay mined near Munster by National Brick Co. of Chicago.

Industrial sand (molding and engine) was produced from a pit near Gary by John N. Bos Sand Co., Chicago.

Byproduct sulfur was recovered from crude petroleum by the Standard Oil Co. at the Whiting plant.

Roofing granules were manufactured from slag by H. B. Reed Co., Inc., at Hammond. Vulcan Materials Co., Chicago, produced railroad ballast, lightweight aggregate, and other products from slag at its plant in Gary.

Pig iron and steel were produced by U. S. Steel Corp., Gary, and by Inland Steel Co. and Youngstown Sheet and Tube Co., East Chicago.

Plants of General Refractories Co., Inc. (Gary), and Harbison-Walker Refractories Co. (East Chicago and Hammond) produced refractories.

Digitized by Google

**La Porte.**—Engine, glass, and molding sands, and building and paving materials were obtained from pits in the county. A deposit near Walkerton yielded marl for soil conditioning.

**Lawrence.**—Dimension limestone was quarried and milled in the Bedford area by Indiana Limestone Co., Inc., and Ingalls Stone Co. Finished building stone also was produced at several mills from rough blocks purchased from local quarries.

Bedford Ground Limestone Co. produced finely ground limestone from spalls purchased from stone mills. The output was sold for mineral food, glass manufacture, and agricultural use.

Crushed limestone was produced by Mitchell Crushed Stone Co., Inc., Oolitic Ground Limestone Co., and Ralph Rogers & Co., Inc. It was sold for flux, concrete aggregate, roadstone, railroad ballast, and agstone.

Sandstone was quarried and milled for use as building stone by Indiana Sandstone Co., Inc., Bedford, and Springs Valley Sandstone Co., West Baden, which operated a quarry at Williams.

Portland and masonry cements were produced at Mitchell by Lehigh Portland Cement Co., which quarried limestone for its own use. Two new kilns replaced 10 smaller kilns, which were part of the original plant. Plant capacity had been substantially increased by modernization.

**Madison.**—Standard Materials Co. of Indianapolis quarried limestone at Lapel. Most of the material was sold for concrete aggregate and roadstone. Some agstone and riprap were produced.

Building and paving materials were obtained from five sand and gravel operations.

**Marion.**—Reed and sedge and humus peat were obtained from a bog near Indianapolis and sold for soil conditioning and horticultural purposes by Peat-Moss, Inc., of Indianapolis.

Indiana Cut Stone Corp. produced building stone from purchased rough blocks.

Several sand and gravel pits and plants were operated in metropolitan Indianapolis and supplied materials for building, road construction, and fill. The county had the largest production of sand and gravel in the State.

**Martin.**—Brick was manufactured from clay mined near Loogootee by Loogootee Clay Products Corp.

A deposit of quartz conglomerate near Shoals was mined and crushed by General Refractories Co. The processed material was shipped to company plants for use in refractories.

Gypsum was mined and processed at two plants near Shoals, one operated by National Gypsum Co. and the other, by United States Gypsum Co. A variety of gypsum products was manufactured.

**Monroe.**—Dimension limestone and sandstone and crushed limestone were produced. Limestone quarries and mills were operated by Ed. Bennett Stone Co., Bloomington Limestone Corp., Empire Stone Co., B. G. Hoadley Quarries, Inc., Independent Limestone Co., Indiana Limestone Co., Ingalls Stone Co., McNeely Quarries, Inc., Midwest Quarries Co., Inc., Victor Oolitic Stone Co., Texas Quarries, Inc., and Woolery Stone Co., Inc. Most of the quarry operators milled the stone at plants in the Bloomington and Bedford areas. Several independent

Digitized by Google

mills fabricated purchased stone. A fine-grinding plant was operated in Bloomington by Indiana Calcium Corp., using spalls purchased from the stone mills. The output was used for a variety of industrial purposes.

Bloomington Crushed Stone Co. operated a quarry and plant near Bloomington and produced roadstone, concrete aggregate, and agstone.

Hinkle Sandstone Co. quarried and milled sandstone for building use.

**Montgomery.**—Brick and heavy clay products were manufactured from clay mined near Crawfordsville. Road materials were obtained from four sand and gravel pits.

**Morgan.**—Building brick, heavy clay products, and lightweight aggregate were manufactured at plants in Brooklyn and Martinsville from clay mined in the area.

Limestone quarried and crushed near Lewisville was used for concrete aggregate, roadstone, and agricultural purposes.

Sand and gravel was mined at three pits near Martinsville and used for fill and building and paving.

**Newton.**—Newton County Stone Co., Inc., produced riprap, agstone, roadstone, and concrete aggregate from a quarry and plant east of Kentland.

Building and paving material was obtained from a sand and gravel pit near Morocco.

**Noble.**—Marl was obtained from a pit near Albion. It was used for soil conditioning. Four sand and gravel pits were mined for building and paving materials.

**Orange.**—Dimension sandstone for building use was milled at French Lick by French Lick Sandstone Co., Inc. The material came from quarries in Lawrence and Martin Counties. Crushed limestone for agricultural use and road material was produced at Paoli by Calcar Quarries, Inc., at French Lick by William Cave Stone Co., and at Orleans by Radcliff & Berry, Inc.

Whetstones were quarried and milled near Orleans by Hindostan Whetstone Co.

**Owen.**—Coal was produced from two strip mines (Old Glory and Burcham).

Fire clay from the Old Glory mine was sold to manufacturers of architectural terra cotta and building brick.

Ingalls Stone Co. operated the Romona limestone quarry and milled the output at its plant in Bedford. Crushed and broken limestone was produced at Spencer by Dunn Limestone Co., Inc., and Clayton Winders & Sons', and near Freedom, by Gordon and Shepard Stone Co. It was used for riprap, flux, railroad ballast, roadstone, and agstone. American Aggregates Corp. purchased the Dunn Limestone Co., Inc., late in the year.

Sand and gravel was produced at three places.

**Parke.**—Coal was mined from two strip mines (Maple Grove and Turner). Fire clay also was obtained from the Turner mine and sold to firebrick manufacturers. Cayuga Brick & Tile Co., Bloomingdale, mined clay for use in manufacturing heavy clay products.

Sand and gravel was obtained from pits near Montezuma and Rockville for road use.

Digitized by Google

**Perry.**—Mulzer Bros. quarried and crushed limestone at Derby for road and agricultural use. U.S. Brick Co. mined clay near Tell City for its own use.

**Pike.**—Six strip and four underground coal mines were operated. The largest output came from the Enos strip mine. The No. 2 mine at Petersburg was acquired by the Day Coal Co. from the Miley Coal Co. The latter company continued to operate the No. 1 mine. Both were underground operations.

**Porter.**—Clay was mined near Chesterton by Charles Lorenz & Son and Chas. H. Schrock. The material was sold for pottery and blast furnace use.

Sand for industrial use (engine, fire, and molding) was produced at four places. Road gravel was mined near Valparaiso.

**Pulaski.**—Francesville Drain Tile Corp., Francesville, mined clay for its own use. Francesville Stone Co., Inc., quarried and crushed limestone in the same area for road materials and agricultural use. A sand and gravel pit operated near Monterey.

**Putnam.**—Portland and masonry cements were produced at Limedale by Lone Star Cement Co. The company mined clay and quarried limestone in the same area for its own use.

Indiana State Farm, Greencastle, mined clay for making brick and heavy clay products and quarried limestone for road material and agricultural use.

Limestone quarries and crushing plants were operated by Midway Stone Co., Inc., at Cloverdale, Ohio, Indiana Stone Corp. at Greencastle, Russellville Stone Co. at Russellville, and Standard Materials Corp. at Manhattan.

Sand and gravel was produced near Brazil.

**Randolph.**—Portland Stone Co. operated the Hiatt Quarry near Albany, and the H. & R. Stone Co. operated a quarry near Ridgeville. Most of the material was used for roads, although some riprap and agstone was produced. Sand and gravel was obtained from three sites.

**Ripley.**—Four limestone quarries and crushing plants were operated by Cord Stone Co., Paul Frank, Inc., New Point Stone Co., and South Eastern Materials Corp. Most of the material was used for road construction and agricultural purposes.

**Rush.**—McCorkle Stone Co. and Rush County Stone Co., both of Milroy, operated limestone quarries and crushing plants.

Road material and fill was produced from three gravel pits.

**Scott.**—The Scott County Stone Co. operated the Hardy quarry and Standard Materials Corp. operated the Hanover quarry. The crushed stone was used mostly for concrete aggregate and road material.

**Shelby.**—Limestone was quarried and crushed at Norristown (Cave Stone Co., Inc.) and St. Paul (St. Paul Quarries, Inc.). Riprap, flux, railroad ballast, roadstone, agstone, and asphalt filler were produced. The Meshberger Stone Co. purchased the Cave Stone Co. during the second half of the year. Building and road material was obtained from sand and gravel pits near Shelbyville.

**Spencer.**—Three strip mines and one underground coal mine were operated. Largest production came from the Mulzer Bros. strip mine.

Digitized by Google

Molding sand was mined from the Hardy Sand Co. pit near Richland.

**Steuben.**—Marl, obtained from pits near Fremont and Hudson, was sold for soil improvement.

Sand and gravel was mined at five sites.

**Sullivan.**—Two strip mines and five underground mines produced coal. Output was substantially larger than in 1959 as two mines, which had been opened in 1959 (Hoosier Gem and Thunderbird), went into full production.

Limestone was quarried and crushed near Freelandsville by Kixmiller Brothers.

Sand and gravel was produced at three places.

**Switzerland.**—Tri-County Stone Co. operated a quarry and plant near Cross Plains and produced road material, agstone, and asphalt filler. The county highway department produced road gravel.

**Vanderburgh.**—Mulzer Bros. operated the West Franklin quarry and produced concrete aggregate and roadstone.

Standard Brick & Tile Co., Evansville, mined clay for use in making building brick.

Bedford-Nugent Co., Evansville, processed sand and gravel dredged from the Ohio River.

**Vermillion.**—Coal was produced from one strip mine and two underground mines.

Arketex Ceramic Corp. mined fire clay from the Dana pit near Newport for use in manufacturing glazed structural tile. Cayuga Brick Corp. mined clay for its own use near Cayuga.

Sand and gravel pits and processing plants were operated near Cayuga by Materials Service Corp. of Chicago, and near Clinton by Standard Materials Corp. of Indianapolis. Building and paving material was produced.

**Vigo.**—Coal production was reported from two strip mines and four underground mines. The Green Valley, Viking, and Chieftain mines were the principal producers. Terre Haute Vitrified Brick Works, Inc., mined clay near West Terre Haute for its own use.

Sand and gravel was produced from five places.

**Wabash.**—Mill Creek Stone Co. operated a limestone quarry and plant near Rich Valley. The output was sold for road material and filler. Sand and gravel production was reported by seven operators.

**Warrick.**—Coal production was reported from seven underground mines and eight strip mines. Warrick County output was the largest in the State. The underground mine of Simpson Mining Co. near Boonville was destroyed by fire in February. In July, Barnett Coal Co. opened a strip mine that was acquired by B & B Coal Co. in October. In February, R. & K. Coal Co. acquired the underground mine near Boonville formerly operated by Rudolph Oil & Coal Co.

At Boonville limestone quarries were operated by Lemmons & Co., Inc., and Sunlight Coal Co. Road material was produced.

Midwest Sand & Gravel dredged sand and gravel from the Ohio River.

**Washington.**—Hoosier Lime & Stone Co., Salem, operated a limestone quarry and produced concrete aggregate and roadstone.

615629—61——26

Digitized by Google

**Wayne.**—DeBolt Stone Quarry, Richmond, produced riprap, road material, and agstone. Sand and gravel was produced at five sites. The Richmond plant of American Aggregates Corp. reported the largest output.

**Wells.**—Limestone was quarried and crushed near Bluffton by Erie Stone Co. of Toledo, Ohio, and Heller Stone Co., Inc. Agstone, road material, railroad ballast, flux, and riprap were produced. Road gravel was produced near Bluffton. Moss peat was obtained from a bog near Warren.

**White.**—Monon Crushed Stone Co., Inc., operated a limestone quarry and plant near Monon. Agstone, railroad ballast, concrete aggregate, and roadstone were produced.

# The Mineral Industry of Iowa

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Geological Survey of Iowa.**

By Samuel A. Gustavson [1]

MINERAL production for Iowa was valued at $95 million in 1960, compared with $88.6 million in 1959. Rising demand for road construction materials, especially sand and gravel and crushed limestone, more than offset slight declines in requirements for building construction. Sales of cement and gypsum, although slightly less than in 1959, were still near record highs.

Iowa's principal commercial minerals are limestone, sand and gravel, gypsum, coal, clays, and peat. Some interest has been shown during recent years in lead and zinc deposits near Dubuque, Dubuque County, and in low-grade iron ore deposits in northeastern Iowa, but there has been no production.

**Employment and Injuries.**—Data on cement, coal, and gypsum was based on 100 percent coverage for each industry. Labor data was partially estimated for the clay, sand and gravel, and stone industries.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Cement.**—Portland cement production and sales each declined about 5 percent from 1959, but still were exceeded only by 1958 and 1959. The average unit value per barrel, f.o.b. mill, increased to nearly $3.50 in 1960, compared with $3.31 in 1959, and total value of cement sales for 1960 was the highest on record, exceeding 1959 by about 1 percent. There was no change in the number of cement plants operating—two in Cerro Gordo County, two in Polk County, and one in Scott County. Total capacity of these plants remained unchanged at slightly over 14 million barrels per year.

Plants operated a total of 27 kilns. Three companies used a wet process, and two used a dry process. Raw materials used in the manufacture of the cement were limestone and clay or shale from local sources, gypsum purchased chiefly from producers operating in Webster County, and purchased iron ore or mill scale. Types I and II, general-use and moderate-heat cements, and type III, high-early-strength and air-entrained cement, were produced at all plants. The market area for sale of cement was chiefly in Iowa and Minnesota, followed by Illinois, Wisconsin, North Dakota, South Dakota, and

[1] Chief, Minneapolis Field Office, Division of Mineral Resources, Bureau of Mines, Minneapolis, Minn.

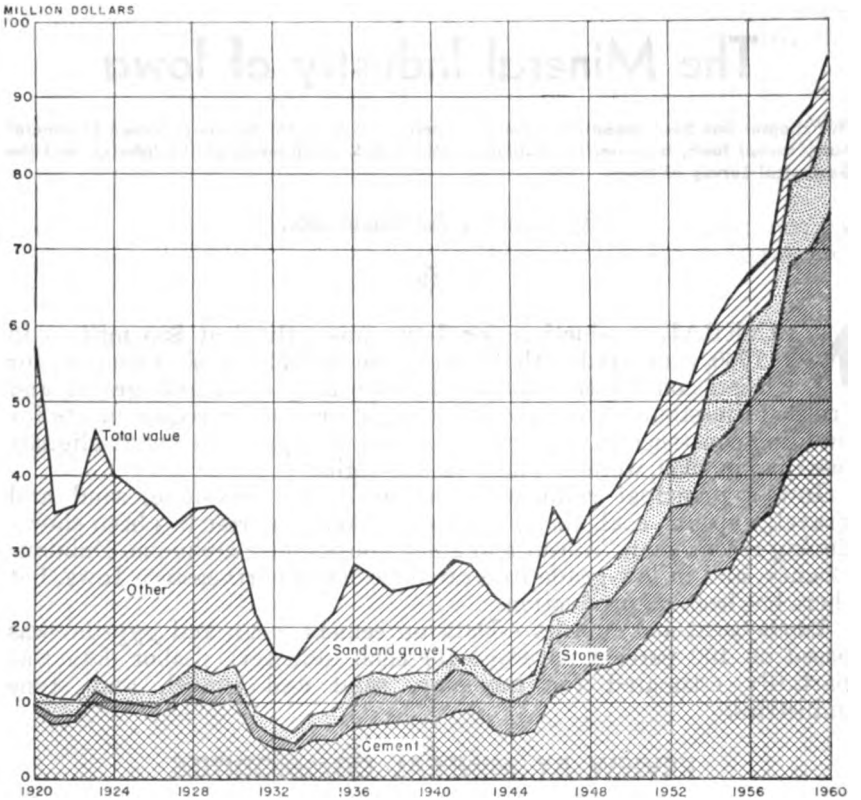

FIGURE 1.—Value of cement, stone, and sand and gravel, and total value of mineral production in Iowa, 1920–60.

Nebraska. Sales as reported by the companies were: 15 percent to building material dealers; 16 percent to concrete product manufacturers; 47 percent to ready-mixed concrete companies; 17 percent to highway contractors; 4 percent to other contractors; and 1 percent to miscellaneous. Most of the cement was shipped by railroad, chiefly in bulk; a relatively small percentage was shipped by truck; and no movement by boat was reported. A total of 283 million kilowatt-hours of electrical energy was consumed—118 million company-produced and 165 million purchased.

Masonry cement was produced at four of the five plants. Sales were down 12 percent from the previous year. The marketing area was similar to that for portland cement. Average value per barrel was $4.54 compared with $4.19 in 1959.

**Clays.**—Shale and clay deposits were mined for use chiefly in the manufacture of building brick, building tile, draintile, cement, mortar mix, and lightweight aggregate. Some fire clay was used in the manufacture of refractories. The Carter-Waters Corp. of Kansas City, Mo., mined shale from a pit near Centerville, Appanoose County, for the manufacture of lightweight aggregate. The company used a kiln

[2] Total adjusted to eliminate duplicating value of clays and stone.

for bloating the shale. Clay used in the manufacture of cement declined, paralleling the slight drop in quantity of cement produced. Of the total clay production, about 48 percent was used in cement manufacture, compared with 52 percent in 1959. Clay used in the production of heavy clay products increased 6 percent over 1959 and, together with the new production for manufacture of lightweight aggregate, effected a 12-percent increase in production of clays for the State.

As in 1959, shale or clay pits were operated by 26 firms in 16 counties. The only changes were the sale late in 1959 of Iowa Clay Products Co. Centerville operation, in Appanoose County, to Adel Clay Prod-

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Total adjusted to eliminate duplicating value of clays and stone.

for bloating the shale. Clay used in the manufacture of cement declined, paralleling the slight drop in quantity of cement produced. Of the total clay production, about 48 percent was used in cement manufacture, compared with 52 percent in 1959. Clay used in the production of heavy clay products increased 6 percent over 1959 and, together with the new production for manufacture of lightweight aggregate, effected a 12-percent increase in production of clays for the State.

As in 1959, shale or clay pits were operated by 26 firms in 16 counties. The only changes were the sale late in 1959 of Iowa Clay Products Co. Centerville operation, in Appanoose County, to Adel Clay Prod-

**TABLE 2.—Employment and injuries for selected mineral industries [1]**

| Year and industry | Average number of men working | Total man-hours | Total number of lost-time injuries | | Total number days lost or charged | Injury frequency rate [2] | Injury severity rate [3] |
|---|---|---|---|---|---|---|---|
| | | | Fatal | Nonfatal | | | |
| 1959: | | | | | | | |
| Cement [4] | 1,069 | 2,736,112 | | 3 | (5) | 1.10 | (5) |

ucts Co., which company also had a pit in Dallas County, and the new operation of Carter-Waters Corp.

**Gypsum.**—Iowa was one of the Nation's major producers of gypsum and gypsum products. In 1960 the State was third in output, following Michigan and California. Production for Iowa in 1960 was about 3 percent less than in 1959, reflecting the slight downward trend in building construction. For many years, all of Iowa's production was from mines in Webster County; however, in 1960 the United States Gypsum Co. started production from a new mine near Sperry in Des Moines County and had nearly completed a plant for processing and manufacturing gypsum products including wallboard and lath.

In Webster County four companies mined and manufactured gypsum products. The products included base-coat plaster, ready-mixed and other special-use plasters, gypsum lath, wallboard, sheathing, tile, other preformed items, and pulverized gypsum. The major markets were in the building industry, in cement manufacture (as a retarder), for agricultural use, and as a filler. Other miscellaneous markets were in the glass and pottery industry, for art moldings, and for medical and dental purposes. The estimated unit value of crude gypsum was $4.23 per ton, about the same as in 1959 when it was calculated at $4.24.

**Lime.**—Linwood Stone Products Co., Inc., was the only producer of quicklime and hydrated lime in the State. Production was slightly greater than in 1959. The company with quarry and plant in Buffalo, Scott County, mined high-calcium limestone, and burned it in a rotary kiln. Fuels used were natural gas and bituminous coal. The products were sold chiefly to the chemical and construction industries.

**Perlite.**—Perlite was expanded in plants operated by each of the four gypsum producers, in Webster County. Virtually all of the output was used in lightweight plaster, chiefly premixed. Crude perlite was purchased from Colorado and Nevada. The chief market area was in Iowa and adjacent States.

**Sand and Gravel.**—There was a 9-percent increase in tonnage and a 16-percent increase in value of sand and gravel produced in Iowa in 1960. Production of building and paving sand increased, paralleling the continued high demand for use in highway work. Average unit values for these uses was only slightly higher than they were 4 years before, in spite of rising labor and material costs, chiefly because of competition in bidding for work. Industrial uses of sand produced in the State included molding sand, blast sand, engine sand, and filter sand. Sales of molding sand, with a relatively high unit value, were considerably greater than in 1959. Molding sand was produced chiefly from a friable sandstone deposit in Clayton County. Sales of sand for other industrial uses declined slightly. The chief industrial use for gravel was in filter beds. Sales were less than in 1959.

About 10 percent of the commercial sand and gravel production was sold as unwashed pit-run material. Commercially produced sand and gravel was transported chiefly by truck. Slightly under 8 percent was hauled by rail, and less than 1 percent, about 30,000 tons, was hauled by water. All noncommercial sand and gravel was hauled by truck.

[3] Includes molding, blast, engine, filter, and other industrial sands.
[4] Includes railroad ballast and other gravel.

The 10 leading producers, several operating in two or more areas of the State, in alphabetical order were:

**Acme Fuel & Material Co., Muscatine.**
**Concrete Materials & Construction Division, American Marietta Co., Cedar Rapids.**
Coon Valley Gravel Co., Des Moines.
Hallett Construction Co., Crosby, Minn.
Keefner Sand & Gravel Co., Des Moines.
L. G. Everist, Inc., Sioux Falls, S. Dak.
Maudlin Construction Co., Webster City.
Northern Gravel Co., Muscatine.
Van Dusseldorf Construction Co., Colfax.
Weaver Construction Co., Iowa Falls.

**Stone.**—Limestone was Iowa's chief mineral raw material, both in tonnage and value. In 1960 production exceeded the previous record year, 1958. Greater use of crushed limestone for highway con-

Digitized by Google

struction and as a concrete aggregate was responsible for the overall increase. These two uses accounted for more than 75 percent of the State's limestone output. Other important markets for limestone declined in 1960. Cement manufacturers used 14 percent of the total; their demand was 7 percent less than in 1959. Soil conditioning and other agricultural uses accounted for about 6 percent of the total limestone production; consumption was 5 percent less than in 1959.

Dimension limestone was produced only in Jones County. The chief use in 1960 was for curbing. Other uses included veneer on houses and flagging for walks or patios.

Several plants in the State specialized in sized limestone and would supply stone to meet most size specifications.

The 10 leading producers of limestone, listed alphabetically, were:

B. L. Anderson, Inc., Cedar Rapids.
Concrete Materials & Construction Division, American Marietta Co., Cedar Rapids.
Dewey Portland Cement Co., Kansas City, Mo.
E. I. Sargent Quarries, Inc., Des Moines.
Kaser Construction Co., Des Moines.
Marquette Cement Manufacturing Co., Chicago, Ill.
Missouri Valley Limestone Co., Oakland.
Penn-Dixie Cement Corp., Nazareth, Pa.
Schildberg Construction Co., Greenfield.
Weaver Construction Co., Iowa Falls.

## MINERAL FUELS

Coal.—Production and value of coal were about 9 percent less than in 1959. Coal mining had recorded a declining trend in Iowa for a number of years as use of natural gas and other petroleum products replaced coal for heating homes and for industrial purposes. Most of the coal produced was consumed in steam-power plants or for heating public buildings. Virtually all Iowa coal was mined within the State about two-thirds was hauled to destination by rail and one-third by truck. In 1960 there were 4 underground and seven

| Van Buren | | 1 | | 15,869 | 15,869 | 83,312 |
| Wapello | 1 | 3 | 2,968 | 46,129 | 49,097 | 175,749 |
| Total | 19 | 25 | 200,100 | 867,924 | 1,068,024 | 3,845,220 |

fewer strip mines operated than in 1959. The average price per ton of coal was $3.60 in 1960, compared with $3.57 in 1959. Prices ranged from $5.73 to $2.75 per ton.

In the 19 operating underground coal mines, there were 17 cutting machines, 22 hand-held or post-mounted drills, and 1 mobile drill used in mining; and 41 animals (horses or mules), 6 electric locomotives, and 4 shuttle cars used in haulage. The 25 strip mines used 28 power shovels of less than 3 cubic yards capacity, 1 power shovel with a capacity between 3 and 5 cubic yards, 13 draglines with buckets of less than 3 cubic yards capacity, 12 draglines with 3- to 5-cubic-yard buckets, 1 dragline with a 6- to 12-cubic-yard bucket and 1 with a bucket of over 12 cubic yards; 38 bulldozers; 22 horizontal power drills; 11 vertical power drills; and 69 trucks. Of the total of 56 power shovels and draglines, 6 were electric, 2 diesel-electric, 38 diesel, and 10 gasoline-operated. Only 3 of the companies employed more that 20 men in their mining operations.

**Peat.**—Bogs in Worth and Winnebago Counties were operated by the Colby Pioneer Peat Co. and the Eli Colby Co. Both companies had processing plants at Hanlontown. Peat was sold both in bulk and packages.

## REVIEW BY COUNTIES

Mineral production was reported from all counties except Davis, Ida, Iowa, Jefferson, Page, Ringgold, Union, and Wayne. Some sand and gravel or limestone may have been produced in these counties, as several companies reporting production of these materials did not submit a breakdown showing output by county of origin. Data covered production of 120 commercial and 29 noncommercial producers of sand and gravel and 91 commercial and 7 noncommercial producers of limestone. Estimates were made for a few nonreporting companies producing these commodities, based on previous reports and other sources of information—notably reports submitted by State, county, and municipal highway departments.

**Appanoose.**—The Carter-Waters Corp. built a plant, including a rotary kiln, and started production of lightweight aggregate from a shale deposit near Centerville. Adel Clay Products Co. purchased

TABLE 6.—Value of mineral production in Iowa, by counties—Continued

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Tama | (2) | $438,974 | Stone, sand and gravel. |
| Taylor | (2) | (2) | Do. |
| Union | $5,978 | ---- | |
| Van Buren | 528,591 | 775,491 | Stone, coal, sand and gravel. |
| Wapello | 440,767 | 743,987 | Sand and gravel, stone, coal, clays. |
| Warren | 33,991 | 62,358 | Sand and gravel, clays. |
| Washington | (2) | (2) | Stone. |
| Webster | 6,320,862 | 6,295,150 | Gypsum, stone, sand and gravel, clays. |
| Winnebago | (2) | 72,802 | Sand and gravel, peat. |
| Winneshiek | 76,165 | 95,038 | Sand and gravel, stone. |
| Woodbury | (2) | 293,555 | Sand and gravel. |
| Worth | 51,360 | 581,906 | Stone, sand and gravel, peat. |
| Wright | 97,798 | 125,013 | Sand and gravel. |
| Undistributed | 14,916,450 | 13,674,532 | |
| Total [3] | 88,557,000 | 95,030,000 | |

[1] The following counties are not listed because no production was reported: Davis, Ida, Iowa, Page, Ringgold, and Wayne.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Total adjusted to eliminate duplicating value of clays and stone.

and operated the pit and plant of Iowa Clay Products Co., also at Centerville.

Bituminous coal was produced at eight underground mines—the largest operator was Sunshine Coal Co. Three companies reporting production in 1959 had no production for 1960. They were Big Five Coal Co., Monitor Coal Co., and Kirkville Coal Co. Kirkville Coal Co. was a strip-mining operation.

Three companies produced limestone for highway or agricultural use.

**Benton.**—Clay was produced by the Garrison Brick & Tile Works for manufacture of heavy clay products. Some sand and gravel and limestone were produced in the county.

**Boone.**—Clay for mortar mix and heavy clay products was produced by Grarok, Inc. Sand and gravel was produced for building and highway use by several companies.

**Cerro Gordo.**—Mineral products from Cerro Gordo County represented about 25 percent of the State total. Two cement companies, Lehigh Portland Cement Co. and Northwestern State Portland Cement Co., manufactured portland cement and mortar mix using locally produced clays and limestone. Clay was also mined by the Mason City Brick & Tile Co. for the manufacture of building tile and draintile.

Limestone was produced for highway construction by the Weaver Construction Co. and Welp & McCarten, Inc. Sand and gravel was produced, chiefly for building and highway use, by three companies.

**Clayton.**—Concrete Materials & Construction Co. mined a friable sandstone deposit on the Mississippi River about a mile south of the town of Clayton and processed the material chiefly for use as a molding sand.

**Dallas.**—Adel Clay Products Co., Redfield Brick & Tile Co., and United Brick & Tile Co. of Iowa all produced miscellaneous clay for the manufacture of building brick, building tile and draintile. Sand and gravel was produced by four companies, chiefly for building and road use.

Digitized by Google

**Des Moines.**—United States Gypsum Co. continued development of an underground gypsum mine near Sperry and construction of facilities for processing the gypsum, including a board plant. Some gypsum was produced in 1960. The processing plant was scheduled for operation in 1961.

Some sand and gravel and limestone, chiefly for highway use, also was produced in the county.

**Floyd.**—Miscellaneous clay was produced by the Rockford Brick & Tile Co. for the manufacture of heavy clay products. Five companies produced crushed limestone and one company produced sand and gravel—chiefly for use in highway work.

**Franklin.**—Sheffield Brick & Tile Co. produced clay for heavy clay products. Sand and gravel was produced by four companies and limestone by three companies. Limestone was used chiefly for road work. Some sand and gravel was sold for railroad ballast.

**Hardin.**—Limestone and sand and gravel primarily for building and paving purposes and valued at $1,825,000 was produced by seven sand and gravel operators and two limestone producers.

**Keokuk.**—Fire clay, chiefly for use in manufacturing heavy clay products, was mined by the Nelson Clay Products Co., formerly reported as John Nelson & Sons. Limestone was produced by the Kaser Construction Co. of Des Moines.

Coal was produced by the Nelson Coal Co. from a strip-mining operation.

**Linn.**—Over $2 million worth of limestone and sand and gravel was produced by four sand and gravel producers and four limestone producers.

**Lucas.**—One underground bituminous coal mine was operated by the Big Ben Coal Co. on a 72-inch seam. The Liberty Coal Co. operated a strip mine.

**Madison.**—Nearly $3 million worth of crushed limestone was quarried in the county and used chiefly by the Marquette Cement Manufacturing Co. and Penn-Dixie Cement Corp. A substantial tonnage of crushed limestone also was produced for concrete aggregate and highway use. Marquette Cement Manufacturing Co. mined clay for use in its cement plant in Polk County.

**Mahaska.**—Bituminous coal was produced by seven companies operating strip mines and one operating an underground mine. The underground operation was by Lennie Coal Co. and was new during the year. Carbon Hill Coal Co., an operator in 1959, was idle in 1960. Angus Coal & Hauling Co. and Mich Coal Co. were the county's largest producers.

Miscellaneous clay for the manufacture of heavy clay products was produced by the Oskaloosa Clay Products Co. and What Cheer Clay Products Co. The latter company produced some material classed as fire clay.

Limestone for highway and agricultural purposes was also produced in the county.

**Marion.**—Most of the bituminous coal produced in the State came from mines in Marion County. Ten of the producers operated strip mines, and three operated underground mines. Largest producers included: Wilkinson Coal Co., Weldon Coal Co., Beard Coal Co.,

Digitized by Google

Lovilia Coal Co., and Jude Coal Co., Inc. Valley Coal Co. and Cedar Creek Coal Co., who produced in 1959, were idle in 1960.

Four companies operated limestone quarries producing stone for road and agricultural use, and four companies reported production of sand or gravel for building and road use.

**Monroe.**—Bituminous coal was produced from five underground mines and two strip pits. One underground mine and two strip pits operating the previous year were idle; they were the White Oak Coal Co., Prothero Coal Co., Inc., and South Iowa Coal Co. One new strip pit was operated by C. N. Knox Coal Co.

A small quantity of limestone was produced for highway and agricultural use.

**Polk.**—Polk County was second in value of minerals produced in the State. Two cement companies operating in the county were the Marquette Cement Manufacturing Co., and Penn-Dixie Cement Corp. Clay and limestone used by these two companies for cement manufacture were produced in Madison County.

Clay for the manufacture of building brick and tile was produced by the Des Moines Clay Co. and John Furman Contracting Co. Considerable sand is produced in the county, chiefly for building and road use. The percentage of gravel in the deposits was low, and gravel had to be shipped into the county.

**Scott.**—Dewey Portland Cement Co., with a plant near Davenport, was purchased by the American Marietta Co. The plant produced types I and II, general-use and moderate-heat cements, and type III, high-early-strength cement using clay and limestone from nearby company-owned sources.

Linwood Stone Products Co., Inc. produced quicklime and hydrated lime at its plant near Buffalo. It was the only lime producer in the State. The products were sold chiefly for chemical, metallurgical, or water treatment uses.

Limestone and sand and gravel were produced by several companies, chiefly for highway and building purposes.

**Story.**—Heavy-clay products were produced by the Nevada Brick & Tile Co. Sand and gravel and limestone for building and highway use were produced.

**Van Buren.**—Bituminous coal was produced from a strip mine by Laddsdale Coal Co., Inc.

An underground limestone quarry was operated by Douds Stone, Inc. The production was for highway construction, concrete aggregate, and agricultural use.

Some sand and gravel also was produced in the county.

**Wapello.**—One underground and three strip-mining operations produced bituminous coal during 1960. Airline Coal Co., New Tanning Coal Co., Inc., and South Iowa Coal Co. operated strip mines, and Aubrey Coal Co. operated an underground mine.

Clay for the manufacture of building brick and tile was produced by the Ottumwa Brick & Tile Co. Some limestone and sand and gravel were produced for highway or agricultural use.

**Warren.**—Building brick and tile were produced by the Carlisle Brick & Tile Co. and Goodwin Tile & Brick Co.

Sand and gravel for highway use was produced by Carlisle Sand & Gravel, Inc.

Digitized by Google

No production of coal was reported in the county during the year.

**Webster.**—Webster County was one of the leading sources of gypsum for the Nation. Four companies operating mines and processing facilities, each with board plants, were: Bestwall Gypsum Co., The Celotex Corp., National Gypsum Co., and United States Gypsum Co. Perlite was expanded by each of the companies for the manufacture of lightweight plasters. The mines were all open-pit operations.

Limestone was produced by Ft. Dodge Limestone Co., Inc. and the Northwest Limestone Co., both from underground operations.

Considerable building tile, draintile, and building brick was produced in the county. Producers included Johnston Clay Works, Inc., Kalo Brick & Tile Co., Lehigh Sewer Pipe & Tile Co., and Vincent Clay Products Co.

**Winnebago and Worth Counties.**—Peat was produced in these two counties by Eli Colby Co. and Colby Pioneer Peat Co.

# The Mineral Industry of Kansas

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the State Geological Survey of Kansas.**

By A. D. Hahn,[1] Edwin D. Goebel,[2] and Walter H. Schoewe [2]

MINERAL production in Kansas in 1960 was valued at $484 million. This brought the total value of minerals produced in the State since 1861 to approximately $9 billion. Output was reported from 100 of the State's 105 counties. Four counties, in which the value of the mineral production was $20 million or more, were in order of rank: Ellis, Barton, Russell, and Butler. The five principal minerals, in order of value, were petroleum, natural gas, cement, stone, and salt.

**Employment and Injuries.**—According to the Employment Security Division of the Kansas Department of Labor, the average annual employment in Kansas mining industries in 1960 was 16,900 persons—a decrease of about 8 percent from 1959. Average weekly earnings per person in the mining industries was $98.80 compared with $100.14 in 1959.

**TABLE 1.—Mineral production in Kansas [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Cement [2] thousand 376-pound barrels | 10,405 | $32,282 | 8,162 | $26,373 |
| Clays thousand short tons | 1,021 | 1,271 | 894 | 1,224 |
| Coal do | 772 | 3,607 | 888 | 4,197 |
| Helium thousand cubic feet | 21,643 | 343 | 21,696 | 350 |
| Lead (recoverable content of ores, etc.) short tons | 481 | 111 | 781 | 183 |
| Natural gas million cubic feet | 604,410 | 72,529 | 634,410 | 74,226 |
| Natural gas liquids: | | | | |
| Natural gasoline thousand gallons | 107,814 | 5,576 | 115,868 | 6,694 |
| LP gases do | 124,874 | 6,658 | 127,270 | 6,343 |
| Petroleum (crude) thousand 42-gallon barrels | 119,543 | 347,870 | [3] 113,455 | [3] 329,020 |
| Salt thousand short tons | 1,123 | 13,670 | 1,213 | 14,109 |
| Sand and gravel do | 11,334 | 7,937 | 9,710 | 6,808 |
| Stone [4] do | 13,999 | 17,108 | 11,814 | 15,031 |
| Zinc (recoverable content of ores, etc.) short tons | 1,017 | 234 | 2,117 | 546 |
| Value of items that cannot be disclosed: Natural cement, gem stones, gypsum, pumice, stone (crushed sandstone) | | 2,012 | | 1,436 |
| Total Kansas [5] | | [6] 508,077 | | 483,958 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Excludes natural cement, included with "Value of items that cannot be disclosed."
[3] Preliminary figure.
[4] Excludes certain stone included with "Value of items that cannot be disclosed."
[5] Total adjusted to eliminate duplication in the value of clays and stone.
[6] Revised figure.

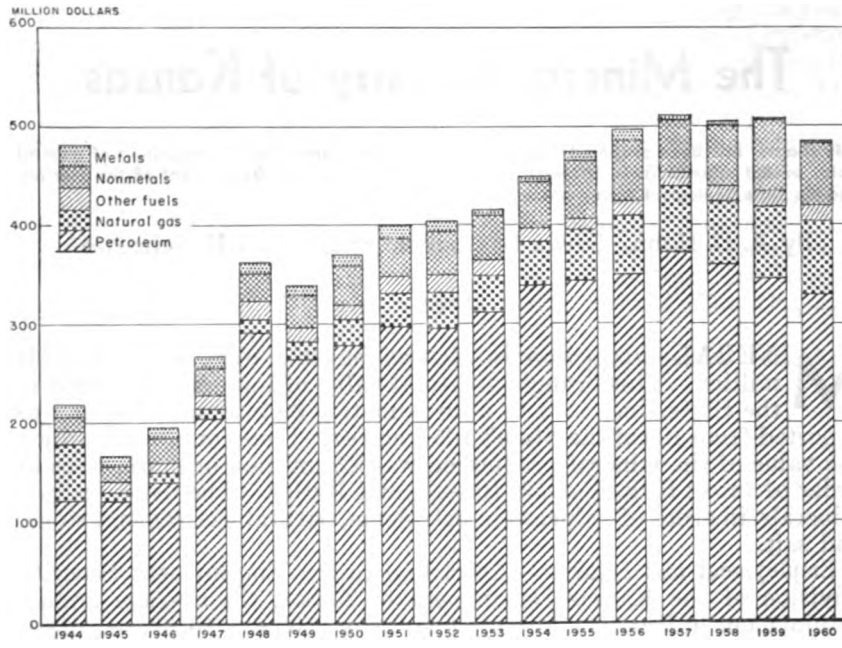

FIGURE 1.— Value of mineral production in Kansas 1944–60.

**TABLE 2.—Average annual employment for selected mineral industries**

| Industry | 1951–55 (average) | 1956 | 1957 | 1958 | 1959 | 1960 |
|---|---|---|---|---|---|---|
| Mining (total) | 18,660 | 19,300 | 18,500 | 18,200 | 18,300 | 16,900 |
| Metal mining | 500 | 400 | 300 | 100 | (1) | (1) |
| Mining and quarrying of nonmetallic metals, except fuels | 1,710 | 2,000 | 1,800 | 1,800 | 1,900 | 1,700 |
| Bituminous coal and lignite mining | 570 | 400 | 400 | 300 | 300 | 300 |
| Crude petroleum and natural gas | 15,880 | 16,000 | 16,000 | 16,000 | 16,100 | 14,900 |
| Petroleum refining and related industries | 5,160 | 4,900 | 4,900 | 4,800 | 4,900 | 4,700 |

[1] Employment estimated to be less than 100.

Source: Employment Security Division, Kansas Department of Labor.

The Workmen's Compensation Commission, State of Kansas, reported that 893 on-the-job injuries occurred in the mining industries in 1960. Of these, 16 were fatal injuries, all in the crude petroleum and natural-gas-production industries.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

The value of mineral fuels (petroleum, natural gas, natural gas liquids, coal, and helium) was about 87 percent of the value of all minerals produced.

**Carbon Black.**—Quantity and value of carbon black declined in 1960. The material was processed in furnace-type plants of Columbian

Digitized by Google

Carbon Co. at Hickok and United Carbon Co. at Ryus in Grant County. Both used liquid petroleum gases and natural gas as feed.

**TABLE 3.—Carbon black production**

| | 1957 | 1958 | 1959 | 1960 |
|---|---|---|---|---|
| Carbon black produced, all grades....pounds.. | 76,419,500 | 75,443,750 | 91,644,160 | 87,302,185 |
| Value at plants | $5,131,569 | $5,271,143 | $6,387,598 | $5,621,236 |
| Natural gas processed.....thousand cubic feet.. | 5,667,958 | 3,262,970 | 4,624,404 | 3,914,444 |
| LP gases and other liquid fuel processed barrels.. | 347,975 | 2,251,023 | 390,063 | 398,415 |

Source: Kansas Corporation Commission.

**Coal.**—Production of bituminous coal rose 15 percent compared with the 1959 output. The increase resulted from substitution of coal for natural gas fuel in an industrial plant in southeastern Kansas. Thirteen coal mines, each producing more than 1,000 tons of coal, were operated in Bourbon, Cherokee, Coffey, Crawford, and Osage Counties. Most of the coal was produced at 11 strip-mining operations; less than 0.5 percent of the total output came from 2 underground mines.

**TABLE 4.—Coal production**

(Excludes mines producing less than 1,000 short tons)

| Year | Number of mines | | | Short tons (thousands) | Value (thousands) |
|---|---|---|---|---|---|
| | Underground | Strip | Total | | |
| 1951-55 (average) | | | | 1,564 | $6,301 |
| 1956 | 4 | 15 | 19 | 884 | 3,856 |
| 1957 | 3 | 14 | 17 | 749 | 3,331 |
| 1958 | 2 | 13 | 15 | 823 | 3,711 |
| 1959 | 2 | 11 | 13 | 772 | 3,607 |
| 1960 | 2 | 11 | 13 | 888 | 4,197 |

**Helium.**—The Federal Bureau of Mines, at its Otis helium plant in Rush County, extracted 21.9 million cubic feet of helium gas from natural gas from the Ryan, Pawnee Rock, Behrens, Unruh, and Reichel fields—about 9 percent less than in 1959. Shipments totaled 21.7 million cubic feet valued at $349,754.

**Natural Gas.**—Kansas ranked fifth in marketed production of natural gas. Estimated proved recoverable gas reserve decreased slightly to 19,620 billion cubic feet. Natural gas was produced in 47 counties; the Kansas part of the Hugoton field, covering all or part of Finney, Grant, Hamilton, Haskell, Kearny, Morton, Seward, Stanton, and Stevens Counties, supplied 71 percent of the State output.

A comprehensive report containing information on existing and potential natural gas storage projects in the State was published in 1960.[3]

Important new gasfields discovered during the year and the initial production of the discovery wells, according to the Kansas Geological Survey, were as follows:

**Natural Gas Liquids.**—Production of natural gas liquids increased 4 percent in quantity and 7 percent in value. Of the total recovered, a little more than half was LP gases and the remainder was natural gasoline. As in 1959, 14 natural gasoline plants were active during the year. Proved recoverable reserves of natural gas liquids was estimated by the American Gas Association at 8,333 million gallons, an increase of 63 million gallons.

| August | 9,786 | 10,709 | 8,333 | 1959 | 119,543 | 119,852 | ---------- |

[1] Preliminary figure.

**Drilling and Exploration.**—Exploratory and development drilling (excluding eastern Kansas) totaled 12.4 million feet,[4] about 13 percent less than in 1959. According to the Kansas Geological Survey, wells drilled totaled 4,479—1,307 less than 1959. Well completions in 1960 were classified as 1,556 oil wells, 159 gas wells, 68 oil and gas wells, 181 repressuring or disposal wells, and 543 dry wildcat wells. The proved crude oil reserve [5] decreased for the fifth consecutive year.

**Pipelines.**—No major pipelines were constructed. Mobil Oil Co. completed an addition to its Hickok gas plant at an approximate cost of $500,000. The addition housed two compressors with a combined delivery capacity of 100 million cubic feet of natural gas a day at a pressure of 300 pounds. The gas was delivered to Cities Service Gas Co.

Skelly Oil Co. announced plans to build a gasoline plant in Clark County, adjacent to the Kansas Power and Light Co. Minneola gas booster station.

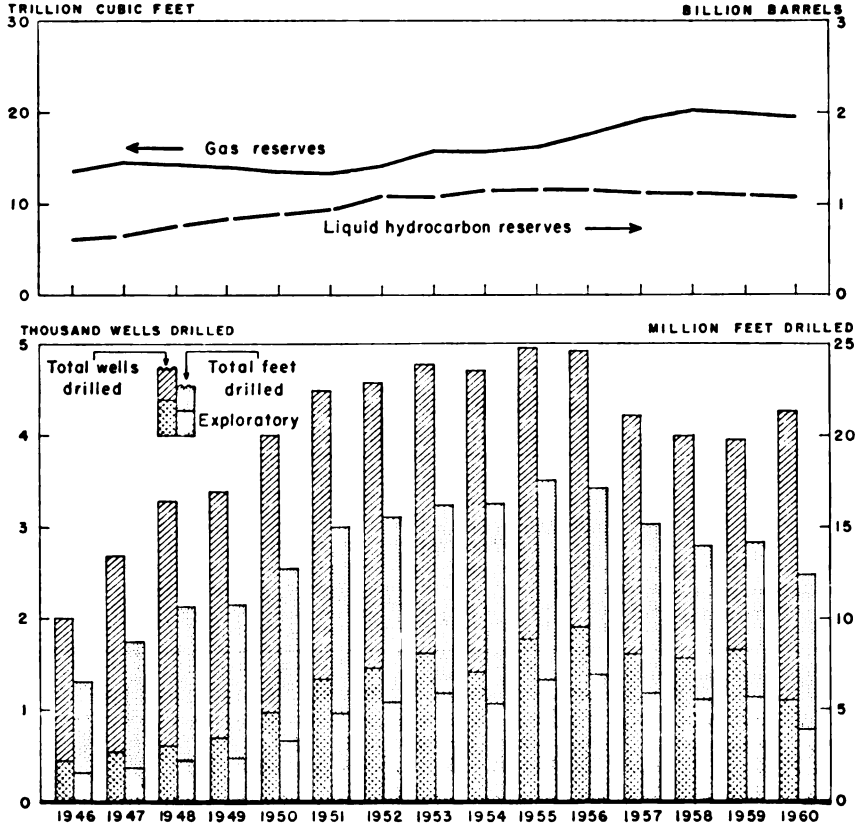

**FIGURE 2.—Proved reserves and drilling in Kansas 1946–60.**

**Refineries.**—Thirteen refineries operated, and processed 109,940,000 barrels of crude petroleum—equivalent to 97 percent of the year's production.

Digitized by Google

**Petrochemicals.**—Western Petrochemical Corp. completed expansion and modernization of its refinery at Chanute. The plant was equipped to produce a white, high-melting, microcrystalline wax.

## NONMETALS

**Cement.**—Portland, natural, and masonry cements were manufactured. Portland cement plants in Allen, Neosho, Montgomery, Wilson, and Wyandotte Counties produced about 8 million barrels, 64 percent of total capacity. About 67 percent was produced by wet-process and 33 percent by dry-process. More than 77 percent of the portland cement was handled in bulk and the remainder was bagged; 95 percent of the shipments were made by rail. Natural cement was produced by Fort Scott Hydraulic Cement Co. in Bourbon County. Masonry cement was manufactured by all the cement plants.

Ash Grove Lime & Portland Cement Co. constructed new storage and materials-handling facilities at its Chanute plant. A total of 60,000 tons of limestone, shale, clinker, gypsum, and coal could be stored in the new building.

**TABLE 14.—Portland cement production and shipments**

(Thousand barrels and thousand dollars)

| Year | Production | Shipments | | Year | Production | Shipments | |
|---|---|---|---|---|---|---|---|

draintile, other structural shapes, lightweight aggregate, and cement. A small amount of fire clay was used by potteries.

Buildex, Inc., announced plans to build a shale-expanding plant near Marquette with a capacity of 125,000 cubic yards of lightweight aggregate a year.

**Gypsum.**—The tonnage and value of crude gypsum mined was less than in 1959. Gypsum-processing plants were operated by National Gypsum Co. near Medicine Lodge, Barber County, and Bestwall Gypsum Co. near Blue Rapids, Marshall County. A fire on August 11 destroyed the calcining, regrinding, and packing departments of the Bestwall Gypsum Co. plant on the Tuttle Creek Reservoir site. Construction on a new plant north of Blue Rapids was not advanced enough to begin calcining crude gypsum before December. Gypsum for the plant was obtained from an underground mine.

**Lime.**—Midwest Lime Co. completed construction of a vertical-kiln lime plant, 4 miles west of Bonner Springs, Leavenworth County, but did not produce commercial lime during 1960.

**Pumice.**—Crude pumice was mined in Lincoln and Norton Counties. The tonnage shipped was 26 percent less, and the value was 39 percent less than in 1959. The material was used in abrasives and cleaning powders.

**Salt.**—Salt output increased 8 percent over 1959. Evaporated and rock salt were produced at six plants in Barton, Ellsworth, Reno, and Rice Counties. Brine was pumped in Sedgwick County by Frontier Chemical Co., Division of Vulcan Materials, for use in manufacturing industrial inorganic chemicals.

A section of the Carey salt mines at Hutchinson was used by Underground Vault and Storage Co., Inc., for industrial storage. Temperature in the mine remains virtually constant, ranging from 68 to 70 degrees.

**TABLE 17.—Salt sold or used by producers**

(Thousand short tons and thousand dollars)

| Year | Evaporated salt | | Rock salt | | Total | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951–55 (average) | 362 | $5,203 | 539 | $2,333 | 901 | $7,436 |
| 1956 | 461 | 6,352 | 543 | 2,815 | 1,004 | 9,167 |
| 1957 | 522 | 7,785 | 496 | 2,568 | 1,018 | 10,353 |
| 1958 | 373 | 7,962 | [1] 700 | [1] 3,386 | 1,073 | 11,348 |
| 1959 | 389 | 9,035 | [1] 734 | [1] 4,635 | 1,123 | 13,670 |
| 1960 | 402 | 9,358 | [1] 811 | [1] 4,751 | 1,213 | 14,109 |

[1] Brine included with rock salt (previously included with evaporated salt) to avoid disclosing individual company confidential data.

**Sand and Gravel.**—Sand and gravel production was reported in 66 counties. Both quantity and value were 14 percent less than in 1959. Virtually the entire output was dredged from flood plain or riverbed deposits and partly processed by dewatering on a 16-mesh screen. About half the tonnage pumped was discarded as silt and fine sand. The product was mostly coarse material containing no pebbles larger than 1 inch and was used for road construction and maintenance. Most plants also screened a few tons of building sand.

[1] Includes diatomaceous marl and limestone for cement.
[2] Figure withheld to avoid disclosing individual company confidential data.
[3] Excludes sandstone.
[4] Excludes crushed sandstone.

**Stone.**—Stone was quarried in 45 counties. Greatest activity was in Allen, Dickinson, Elk, Jewell, Neosho, Shawnee, Wilson, and Wyandotte Counties. These 8 counties furnished 48 percent of the total value of the stone produced in Kansas. The following classes of stone were produced: Crushed limestone in 43 counties, crushed sandstone in 4 counties, dimension limestone in 6 counties, dimension sandstone in 2 counties, and miscellaneous stone (chats) obtained from lead-zinc mill tailing in Cherokee County.

Diatomaceous marl was mined at an open pit in Wallace County. The tonnage and value of this production is included in the totals reported for stone in table 1.

## METALS

The Kansas lead-zinc mining area is part of the Tri-State district, which also includes northeast Oklahoma and southwest Missouri. Lead-zinc mines remained idle during the year, although a small tonnage of mine-run ore was produced in gouging and cleanup operations. The recovered lead and zinc concentrates were obtained mostly by remilling selected mill tailing, accumulated throughout the years at several mills in the district. Further details on Tri-State lead-zinc mining are given in the Oklahoma chapter.

**Smelters.**—The Eagle-Picher Co. manufactured pigments and sulfuric acid at its lead smelter near Galena. Zinc- lead pigments were made by Ozark Smelting & Mining Co. in its plant at Coffeyville.

Digitized by Google

TABLE 20.—Mine production of lead and zinc, in terms of concentrate and recoverable metals[1]

| Year | Mines producing | Lead concentrate (galena) | | Zinc concentrate (sphalerite) | | Recoverable metal content[2] | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | | Lead | | Zinc | |
| | | Short tons | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) | Short tons | Value (thousands) |
| 1951–55 (average) | ------- | 7,364 | $1,420 | 43,835 | $4,204 | 5,548 | $1,724 | 23,324 | $6,694 |
| 1956 | 41 | 10,130 | 1,955 | 53,142 | 4,698 | 7,635 | 2,397 | 28,665 | 7,854 |
| 1957 | 43 | 5,703 | 1,026 | 29,189 | 2,311 | 4,257 | 1,218 | 15,859 | 3,679 |
| 1958 | 25 | 1,828 | 242 | 8,210 | 499 | 1,299 | 304 | 4,421 | 902 |
| 1959 | 11 | 702 | 93 | 1,971 | 149 | 481 | 111 | 1,017 | 234 |
| 1960 | 4 | 1,411 | 129 | 4,162 | 314 | 781 | 183 | 2,117 | 546 |

[1] Based on Kansas ore and old tailing treated at mills during calendar year indicated.
[2] In calculating metal content of the ores from assays, allowance made for smelting losses of both lead and zinc. In comparing values of concentrate (ore) and metal, value given for concentrate is that actually received by producer, whereas value of lead and zinc is calculated from average price for all grades.

**Lead.**—The tonnage of lead recovered increased 62 percent over that of 1959. Lead concentrates were produced at two custom mills, the Bird Dog mill of The Eagle-Picher Co. and the Robinson mill of Rea Lead & Zinc Co., and at the underground mill operated by Ora Black.

**Zinc.**—More than twice as much zinc concentrate was produced as in 1959. Concentrates were recovered in The Eagle-Picher Co. Bird Dog mill, Rea Lead & Zinc Co. Robinson mill, and Ora Black's mill.

## REVIEW BY COUNTIES

Mineral production was reported in 100 of the State's 105 counties; no mineral production was reported in Brown, Lane, Mitchell, Ottawa, and Wichita Counties. Sixty counties reported mineral output valued at more than $1 million each, and the five principal producing counties—Ellis, Barton, Russell, Butler, and Graham—contributed 27 percent of the value of mineral production.

**Allen.**—Allen County led in output of cement. Portland and masonry cements were produced by Lehigh Portland Cement Co. at Iola and by The Monarch Cement Co. at Humboldt. Petroleum and natural gas were recovered. Clay for making heavy clay products was quarried by Humboldt Brick & Tile Co. and United Brick & Tile Co. Limestone was quarried and crushed for concrete aggregate, roadstone, and agricultural use.

**Anderson.**—Limestone was quarried and crushed for concrete aggregate, roadstone, and agricultural use by Murray Limestone Products Co. and Hunt Rock Co. Petroleum was produced chiefly by secondary-recovery methods.

**Atchison.**—George W. Kerford Quarry Co., Ralph H. Bromley & Sons Quarry, and the U.S. Army Corps of Engineers produced crushed limestone for concrete aggregate, roadstone, and riprap.

**Barber.**—The county ranked sixth in natural gas and natural gas liquids output. Petroleum was obtained from 35 fields in the county, and natural gas liquids were recovered by Skelly Oil Co. at its Medicine Lodge plant. Crude and calcined gypsum was produced by

**TABLE 21.—Value of mineral production in Kansas, by counties[1]—Continued**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Osborne | $229,487 | $214,252 | Petroleum, sand and gravel, stone. |
| Pawnee | 5,312,360 | 4,213,732 | Petroleum, natural gas, sand and gravel. |
| Phillips | 5,694,906 | 5,632,300 | Petroleum, stone, sand and gravel. |
| Pottawatomie | 93,838 | 220,463 | Stone, sand and gravel. |
| Pratt | 7,136,747 | 5,659,876 | Petroleum, natural gas, sand and gravel. |
| Rawlins | 242,669 | 1,169,883 | Petroleum. |
| Reno | 12,820,471 | 12,015,301 | Salt, petroleum, natural gas, sand and gravel, natural gas liquids. |
| Republic | (2) | (2) | Sand and gravel. |
| Rice | 16,393,733 | 15,658,437 | Petroleum, salt, natural gas, stone, sand and gravel. |
| Riley | 266,842 | 793,784 | Petroleum, stone, sand and gravel. |
| Rooks | 16,949,647 | 16,058,630 | Petroleum. |
| Rush | 1,808,536 | 1,457,041 | Petroleum, helium, natural gas, natural gas liquids. |
| Russell | 26,692,236 | 24,852,926 | Petroleum, natural gas, sand and gravel. |
| Saline | 2,074,955 | 2,439,622 | Petroleum, sand and gravel. |
| Scott | 106,515 | 125,040 | Petroleum. |
| Sedgwick | 13,605,922 | 10,009,238 | Petroleum, salt, sand and gravel, natural gas, natural gas liquids. |
| Seward | 5,165,877 | 6,187,259 | Natural gas, natural gas liquids, petroleum. |
| Shawnee | 930,957 | 1,075,343 | Stone, sand and gravel. |
| Sheridan | 1,599,100 | 1,337,929 | Petroleum, sand and gravel. |
| Sherman | 468,157 | 381,967 | Do. |
| Smith | 7,650 | 5,850 | Sand and gravel. |
| Stafford | 17,252,227 | 17,186,369 | Petroleum, natural gas, sand and gravel. |
| Stanton | 2,943,660 | 2,495,716 | Natural gas, petroleum. |
| Stevens | 12,607,505 | 13,447,800 | Do. |
| Sumner | 8,730,337 | 9,189,528 | Petroleum, natural gas, sand and gravel. |
| Thomas | 77,935 | 102,446 | Sand and gravel, petroleum. |
| Trego | 5,576,974 | 4,985,647 | Petroleum, sand and gravel. |
| Wabaunsee | 703,349 | 806,844 | Petroleum, stone, sand and gravel. |
| Wallace | 65,480 | 67,560 | Stone, sand and gravel. |
| Washington | 138,965 | (2) | Sand and gravel. |
| Wichita | 631 | | |
| Wilson | 6,234,081 | 4,839,357 | Cement, stone, petroleum, clays, natural gas, sand and gravel. |
| Woodson | 2,251,005 | 2,269,587 | Petroleum, natural gas. |
| Wyandotte | 8,868,520 | 7,501,243 | Cement, stone, sand and gravel. |
| Undistributed | 1,592,117 | 786,927 | |
| Total | [3] 508,077,000 | 483,958,000 | |

[1] Lane and Ottawa Counties are not listed because no production was reported in 1959 or 1960.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Revised figure.

National Gypsum Co. Gravel for road surfacing was produced by the Barber County Highway Department.

**Barton.**—Barton County ranked second in total value of mineral and petroleum production. Sand for building and road surfacing was produced by DuBois Sand Co., Moos Bros. Sand Co., Arkansas Sand Co., Klepper Sand Co., and James Dirks. Clay for heavy clay products was quarried by Kansas Brick & Tile Co. and Acme Brick Co.

**Bourbon.**—Fort Scott Hydraulic Cement Co., Inc., manufactured natural and masonry cements at Fort Scott. Dimension sandstone was quarried by Bandera Stone Co., Cullor Limestone Co., Inc., and Fort Scott Hydraulic Cement Co., Inc. Bourbon County Highway Department quarried and crushed limestone for concrete aggregate, roadstone, riprap, agricultural stone, and other uses. Coal was strip-mined by Garrett Coal Co. A small quantity of petroleum was recovered.

**Butler.**—Butler County ranked fourth in value of mineral and petroleum production. Secondary-recovery operations supplied a large part of the petroleum. Vickers Petroleum Co., Inc., at Potwin, pro-

Digitized by Google

duced benzene, toluene, xylenes, and higher aromatics. Mobil Oil Co. produced select aromatic oils from petroleum fractions at its plant near Augusta. Limestone was quarried and crushed for concrete aggregate and roadstone by Myers Material, Inc. and Carr Rock Products Co.

**Chautauqua.**—Petroleum and natural gas were recovered. Sedan Limestone Co. quarried and crushed limestone for concrete aggregate and roadstone.

**Cherokee.**—The State's entire production of lead and zinc originated in Cherokee County. Producers were Ora Black, The Eagle-Picher Co., Henderson-Tucker Mining Co., M and B Mining Co., and Rea Lead and Zinc Co. At Galena, The Eagle-Picher Co. operated its lead smelter and pigment plant and produced sulfuric acid by the contact method. A few pounds of mineral specimens, mostly calcite and sphalerite crystals in hand specimens, were produced for sale by roadside vendors.

The county continued to lead in coal mining. Strip mines were operated by P & M Coal Mining Co., Wilkinson Coal Co., S & M Coal Co., Inc., and Black Diamond Coal Co. Miscellaneous stone (chats) was obtained from lead-zinc mill tailing by four operators. Leading producers were The Eagle-Picher Co., Baxter Chat Co., and Southwest Rock & Chat Co. Crushed limestone for concrete aggregate and roadstone was produced by John J. Stark. Clay for manufacturing heavy clay products was mined by United Brick & Tile Co. A small quantity of natural gas was recovered.

**Cloud.**—Cloud County led in value of clay produced. Clay for manufacturing heavy clay products was quarried near Concordia by Cloud Ceramics. Earl Beaver Sand Co. and Fyfe Sand & Gravel Co. produced building sand and fill sand.

**Cowley.**—Petroleum and natural gas were produced. Dimension limestone was quarried and dressed by Silverdale Cut Stone Co., Silverdale Limestone Co., and John V. Elam. Crushed limestone was produced by C. L. Daniels Stone Co. Sand and gravel was quarried by McFarland Gravel Co., Oxford Sand & Gravel Co., Andrews Sand & Gravel Co., Myers Materials, Inc., Wilson Bros., and Warren R. Phillips.

**Crawford.**—Crawford County ranked second in value of coal and clay produced. Coal was mined underground by Blue Ribbon Coal Co. and strip mined by Clemens Coal Co., Apex-Compton Coal Co., Inc., Palmer Coal Co., and Cliff Carr Coal Co. Clay was quarried by W. S. Dickey Clay Manufacturing Co. for use in making heavy clay products. John J. Stark quarried and crushed limestone for concrete aggregate, roadstone, agricultural stone, and riprap. Small quantities of petroleum and natural gas were recovered.

**Dickinson.**—Limestone was quarried and crushed for concrete aggregate, roadstone, agricultural stone, and riprap by Anderson-Oxandale and Riddle Quarries, Inc. Sand and gravel for building and paving was produced by Shoffner Sand & Gravel Co. A small quantity of petroleum was recovered.

**Doniphan.**—George W. Kerford Co., Inc., Wolf River Limestone, Inc., Everett Quarries, Inc., Doniphan County Engineer, and the

Digitized by Google

U.S. Army Corps of Engineers quarried and crushed limestone for concrete aggregate, roadstone, agricultural stone, and riprap.

**Douglas.**—Sand for building and miscellaneous uses was produced by Bowersock Mills & Power Co. near Lawrence. Crushed limestone for concrete aggregate and roadstone was produced by Clark Rock Quarry. Petroleum was recovered. Cooperative Farm Chemicals Association produced ammonia, ammonium nitrate, and nitrogen solutions, using natural gas as raw material.

**Edwards.**—Petroleum and natural gas were recovered. Showalter Sand & Gravel Co. and Kinsley Sand & Gravel Co. produced sand and gravel for building and paving.

**Elk.**—Elk County ranked second in value of stone produced. Limestone was quarried and crushed for concrete aggregate, roadstone, railroad ballast, agricultural stone, and riprap by Concrete Materials-Construction Co. Petroleum and natural gas were recovered.

**Ellis.**—Ellis County led in total value of mineral and petroleum production. Crushed limestone was produced by Ellis County Highway Department.

**Ellsworth.**—Rock salt was mined near Kanopolis by Independent Salt Co. Clay for heavy-clay products was quarried and used by Acme Brick Co. Petroleum and natural gas were recovered. Stoppel Construction Co. and Ellsworth County Highway Department produced sand for paving and structural uses.

**Finney.**—Natural gas and petroleum were produced in the Finney County section of the Hugoton gas area. Natural gasoline was recovered by Northern Natural Gas Co. at its plant near Holcomb. Sand was dredged from the bed of the Arkansas River by Sam Alsop Construction Co.

**Ford.**—Sand and gravel was dredged by Miller Sand & Gravel Co., Dodge City Sand Co., and Davis & Sons Sand Sales. Petroleum and natural gas were recovered.

**Franklin.**—Buildex, Inc., mined miscellaneous clay near Ottawa and produced lightweight aggregate by the Haydite process. Petroleum was recovered mainly by secondary-recovery methods. Limestone was quarried and crushed for concrete aggregate, roadstone, and agricultural stone by Dan Fogle.

**Graham.**—Graham County ranked fifth in value of mineral and petroleum production.

**Grant.**—Grant County led in output of natural gas liquids and ranked second in natural gas production. Natural gas was recovered from the Hugoton and Panoma gas areas. Columbian Carbon Co. at Hickok and United Carbon Co. at Ryus produced the State's entire output of carbon black. Hugoton Production Co., Mobil Oil Co., and Pan American Petroleum Corp., produced natural gasoline, butane, and propane. Petroleum was recovered.

**Greenwood.**—Petroleum was produced in Greenwood County, largely by secondary-recovery methods. Greenwood County Engineer, Myers Materials, Inc., and Sedan Limestone Co. quarried and crushed limestone for concrete aggregate and roadstone.

**Haskell.**—Natural gasoline was recovered at the Northern Natural Gas Co. plant near Sublette. Petroleum, natural gas, and sand and gravel were produced.

Digitized by Google

**Johnson.**—Limestone was quarried and crushed for concrete aggregate and roadstone by Reno Construction Co. and Deitz Hill Development Co. Petroleum and natural gas were recovered.

**Kearny.**—Kearny County ranked fourth in output of natural gas and natural gas liquids. Petroleum also was recovered. Kansas-Nebraska Natural Gas Co. recovered natural gasoline, propane, and LP gases at Deerfield; Colorado Interstate Gas Co. recovered natural gasoline at Lakin. Popejoy Sand & Gravel Co. and Kearny County Highway Department obtained sand from local deposits.

**Kingman.**—Kingman County ranked third in recovery of natural gas liquids. Natural gasoline, butane, and propane were recovered by Mobil Oil Co. at Spivey. Petroleum and natural gas were produced. Sand for construction was produced by Ray Wells.

**Lincoln.**—Sandstone was quarried for filter beds, concrete aggregate, roadstone, railroad ballast, and riprap by Quartzite Stone Co. Ernest Hanzlicek mined pumice.

**Marshall.**—Bestwall Gypsum Co. mined and processed gypsum at Blue Rapids. New plant facilities, built on high ground to replace the former plant in the Tuttle Creek Reservoir site, began operating in December. Blue River Sand & Gravel Co., Heinzelman Construction Co., C. V. Garrett, and Hugo P. Vogler produced sand and gravel. Anderson-Oxandale, Hopper Bros. Quarries, and Swanson Construction Co. quarried and crushed limestone for concrete aggregate, roadstone, and agricultural stone.

**Montgomery.**—Portland and masonry cements were manufactured by Universal Atlas Cement, Division of United States Steel Corp., at its Independence plant. Petroleum and natural gas were recovered. Clay for making heavy clay products was quarried by United Brick & Tile Co. Limestone was crushed by H & S Rock Co. and Universal Atlas Cement, Division of United States Steel Corp.

**Morton.**—Morton County ranked third in natural gas production. Output came mostly from the Greenwood and Hugoton gas areas. Petroleum also was recovered.

**Neosho.**—Neosho County ranked second in production and shipment of cement. Ash Grove Lime & Portland Cement Co. produced portland and masonry cements. Petroleum and natural gas were recovered. A large part of the petroleum was recovered by secondary-recovery methods. Crushed limestone was produced by Harry Byers & Sons, Inc., O'Brien Rock Crusher, and Neosho County Engineer.

**Norton.**—Pumice was mined at Calvert by Wyandotte Chemical Corp. for use in cleaning and scouring products. Petroleum was recovered.

**Osage.**—Osage County ranked third in coal production. Coal was mined underground by Bell Coal Co. and strip-mined by Johnson Coal Co.

**Reno.**—Reno County led in value of salt produced. Morton Salt Co., Carey Salt Co., and Barton Salt Co. produced evaporated salt. Rock salt was mined by Carey Salt Co. Petroleum, natural gas, and natural gas liquids were recovered. Cities Service Oil Co. recovered natural gasoline, propane, and LP gases at its Burrton plant. J. E. Steele Sand & Gravel Co., J. H. Shears Sons, Inc., Mummey Sand &

Digitized by Google

Gravel, Fountain Sand Pit, Haven Sand Co., and the city of Hutchinson produced sand and gravel.

**Rice.**—Evaporated and rock salt were produced at Lyons by American Salt Corp. Natural gas was recovered. Riddle Bros. Quarries quarried and crushed limestone for concrete aggregate, roadstone, agstone, and riprap. Sand and gravel was quarried by Rock Hill Stone & Gravel Co., Tobias, Wright, and Birchenough, Inc., Arensman Sand & Gravel Co., Sterling Sand & Gravel Co., Inc., and A. L. Stapleton.

**Rush.**—Petroleum, natural gas, natural gas liquids, and helium were recovered. Natural gasoline and butane were recovered at the Independent Lease Management Co. Otis plant. Helium was recovered from natural gas at Otis by the Federal Bureau of Mines.

**Russell.**—Russell County ranked third in total value of mineral output. Natural gas was recovered.

**Saline.**—Saline County ranked third in production of sand and gravel. Salina Sand Co., Inc., Shoffner Sand, Inc., and Central Kansas Sand Co. dredged sand and gravel for building, paving, and other uses. Petroleum was recovered.

**Sedgwick.**—Sedgwick County ranked second in output of sand and gravel. Kansas Hydrocarbon Co. recovered natural gasoline and LP gases at its Cheney plant, and Cities Service Oil Co. recovered natural gasoline, propane, and LP gases at its Wichita plant. Petroleum and natural gas were recovered. Sand and gravel was produced by 13 commercial operators. Frontier Chemical Co., a Division of Vulcan Materials Co., pumped brine from wells and manufactured chlorine, caustic soda, and salt. These materials were used to produce chloroform, wood preservatives, carbon tetrachloride, and grain fumigants.

**Seward.**—Seward County ranked second in natural gas liquids production. Natural gas—mainly from the Hugoton gas area—and petroleum were recovered. Natural gasoline, butane, and propane were recovered by Panhandle Eastern Pipe Line Co. at its Liberal plant.

**Shawnee.**—Shawnee County ranked fourth in value of sand and gravel output. Building, paving, and fill sand and gravel, blast sand, and engine sand were produced. Producers included Kansas Sand Co., Inc., Consumers Sand Co., Victory Sand & Gravel Co., River Sand Co., and Topeka Sand Co.

**Stafford.**—Natural gas and petroleum were recovered. Partin Sand & Gravel Co. and Stafford County Highway Department produced sand and gravel for road surfacing and building.

**Stevens.**—The county continued as the State's leading producer of natural gas.

**Trego.**—Petroleum and sand and gravel were produced. The county ranked sixth in sand and gravel production. San Ore Construction Co., Inc., Siebert Sand Co., and Trego County Highway Department mined paving sand and gravel.

**Wallace.**—DeLore Division of National Lead Co. produced diatomaceous marl for use as flatting pigment in paint. Sand and gravel was produced for paving and structural use.

**Wilson.**—General Portland Cement Co. manufactured portland and masonry cements at Fredonia. Carr Rock Products Co. and Benedict Rock & Lime Co. quarried and crushed limestone for concrete aggregate, roadstone, and agricultural stone. Acme Brick Co. in

Digitized by Google

Buffalo and Excelsior Brick Co. in Fredonia quarried clay for use in manufacturing heavy clay products. Petroleum and natural gas were recovered.

**Wyandotte.**—The county led in output of stone and sand and gravel. Thompson-Strauss Quarries, Inc., Peerless Quarries, Inc., and American Rock Crusher Co. mined limestone in underground quarries and crushed it for concrete aggregate, roadstone, agricultural stone, and asphalt base. Sand and gravel was produced by six operators; leading producers were Holliday Sand & Gravel Co., Stewart Sand & Material Co., American Sand & Gravel Co., Builders Sand Co., and Peck-Woolf Sand & Material Co. Portland and masonry cements were manufactured by Lone Star Cement Corp.

# The Mineral Industry of Kentucky

**This chapter has been prepared under a cooperative agreement for collecting mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Kentucky Geological Survey.**

By Avery H. Reed, Jr.,[1] Preston McGrain,[2] and Mildred E. Rivers [3]

MINERAL PRODUCTION in Kentucky in 1960 was about the same as in 1959. Coal output increased 6 percent, and production of miscellaneous clay established a new annual record. Among the States, Kentucky ranked second in ball clay and fluorspar production and third in production of bituminous coal. The total value of mineral output decreased 1 percent but was 18 percent below 1948, the record year.

Coal mining dominated Kentucky's mineral industry, supplying 68 percent of the total value, compared with 65 percent in 1959. Leading companies were Peabody Coal Co., United State Steel Corp., Nashville Coal Co., Inland Steel Co., and Bethlehem Mines, Inc.

**Employment and Injuries.**—Employment decreased in all industries. Man-hours worked at coal mines were about the same as in 1959, but 1,800 less men worked, a decline of 6 percent.

Injury experience was about the same as in 1959. Sixty-four fatalities occurred, compared with 46 in 1959 and 59 in 1958.

**Trends and Developments.**—Kentucky Power Co., subsidiary of American Electric Power Co., broke ground at Louisa, Ky., for construction of a $39 million electric powerplant. The 265,000-kw. plant was scheduled to burn 800,000 tons of coal annually. All the coal was expected to be purchased from mines in eastern Kentucky.

The U.S. Engineers Board of Review approved a $151 million high dam at Devil's Jump on the Big South Fork of the Cumberland River in McCreary County. The proposed dam will be 483 feet high, the highest dam east of the Mississippi, and will create a reservoir extending 67 miles upstream into Tennessee.

**Legislation and Government Programs.**—The Federal Geological Survey and the Kentucky Geological Survey started work on a cooperative program to map the bedrock geology of the State on a 7½-minute-quadrangle basis. The $12 million program was expected to take 10 years to complete. Approximately 30 geologists will be employed. One-third of the counties in Kentucky had never been mapped in detail. In eastern Kentucky, 12 counties had never had

[3] Figure withheld to avoid disclosing individual company confidential data.
[4] Excluding oil and gas.
[5] Preliminary figures.

areal geologic maps made, and 7 central and 12 western counties had never been mapped. Kentucky, however, has the distinction of being the first State to be completely mapped for topography by the Federal Geological Survey, on a scale of 1 inch to 2,000 feet.

## REVIEW BY MINERAL COMMODITIES

### MINERAL FUELS

**Coal.**—Coal production increased 6 percent but was 21 percent below the 1947 record. Bituminous coal was mined at 2,164 mines in 43 counties, compared with 1,724 mines in 43 counties in 1959. Leading counties were Hopkins, Muhlenberg, Pike, and Harlan. Leading producing companies were Peabody Coal Co., United States Steel Corp., Nashville Coal Co., Inland Steel Co., and Bethlehem Mines, Inc.

Tennessee Valley Authority purchased options on about 70,000 acres of coal land in eastern Kentucky and studied potential sites for power plants in the area.

Peabody Coal Co. placed an order for the world's largest power shovel, a 115-yd. giant more than twice the size of any shovel now in service. It will be as tall as a 20-story building, weigh about 7,000 tons, and will require over 12,000 horsepower to operate. It will have estimated capacity to handle 3 million cubic yards of overburden per month. The shovel was scheduled for delivery about August 1962.

Tennessee Valley Authority announced that its new Paradise steam plant under construction on Green River at the village of Paradise, a few miles from Central City, would be the largest steam-electric generating plant in the world. The first unit was estimated to cost $100 million. The plant was being built on top of the Muhlenberg

Digitized by Google

County coal field. Coal for the plant will be supplied by Peabody Coal Co. from a huge strip mine it will open a short distance from the plant. The plant will have an initial capacity of 1,200,000 kilowatts and an ultimate capacity of 2,400,000 kilowatts.

At the end of the year, West Kentucky Coal Co. closed the East Diamond mine, near Madisonville, which had been in operation since 1945 and which has produced nearly 17 million tons of coal.

In the eastern Kentucky coal field, 2,037 mines in 31 counties produced 36,260,000 tons, compared with 1,609 mines in 31 counties, and 33,194,000 tons in 1959. Average production per mine decreased from 20,600 to 17,800 tons. Underground mines produced 88 percent, auger mines 7 percent, and strip mines 5 percent of the total. Shipments were 82 percent by rail or water and 18 percent by truck. Captive tonnage was 21 percent of the total.

Equipment used at 1,866 underground mines included 1,050 cutting machines, which cut 88 percent of tonnage; 1,540 power drills, which drilled 84 percent of material drilled; 291 mobile loading machines, which loaded 51 percent of the tonnage; 45 continuous mining machines, which loaded 11 percent; and 56 conveyors, which loaded 1 percent; plus 1,001 locomotives, 457 shuttle cars, 112 rope hoists, and 102 mother conveyors.

Equipment used at 68 strip mines included 104 power shovels, 1 dragline, 69 bulldozers, 29 power drills, and 230 trucks.

Equipment used at 103 auger mines included 104 coal-recovery augers, 13 power shovels, 2 carryall scrapers, 56 bulldozers, 4 power drills, and 138 trucks.

Of the total coal production, 48 percent was cleaned, 30 percent was crushed, and 21 percent was treated.

In the western Kentucky coal field, 127 mines in 12 counties produced 30,587,000 tons, compared with 29,616,000 tons in 1959. Average production per mine decreased from 258,000 to 241,000 tons. Underground mines produced 42 percent, and strip mines 58 percent of total production. Shipments were 95 percent by rail or water and 5 percent by truck. All coal was sold in the open market.

Equipment used at 64 underground mines included 133 cutting machines, which cut 97 percent of the tonnage; 132 power drills, which drilled 94 percent of material drilled; 128 mobile loading machines, which loaded 96 percent of the tonnage; 171 locomotives, 253 shuttle cars, 26 rope hoists, 67 mother conveyors, and 4 continuous miners.

Equipment used at 61 strip mines included 103 power shovels, 39 draglines, 6 carryall scrapers, 92 bulldozers, 64 power drills, and 286 trucks. An estimated 144,800,000 cubic yards of overburden was excavated.

Equipment used at two auger mines included two coal-recovery augers, one bulldozer, and four trucks.

Thirty-seven cleaning plants cleaned 88 percent of the coal produced; 44 percent was crushed, and 23 percent was treated with oil or calcium chloride.

**Natural Gas.**—Marketed production of natural gas increased 2 percent but was 22 percent below the 1947 record. At yearend, 4,829 gas wells were producing. Cumulative natural gas production for the State since 1883 was 2,080,000 million cubic feet.

**Natural Gas Liquids**—*Natural Gasoline.*—Production of natural gasoline was considerably less than in 1959.

*LP Gases.*—Production of liquefied-petroleum (LP) gases increased over 1959.

**Petroleum.**—Production of crude petroleum decreased 22 percent below the record established in 1959. At the end of the year, 14,584 oil wells were producing. Leading counties were Henderson, Green, and Union, compared with Green, Henderson, and Daviess in 1959.

## NONMETALS

**Barite.**—Marion Mining Co., Inc., and J. Willis Crider Fluorspar Co. mined crude barite in Crittenden County for oil well drilling.

**Cement.**—Kosmos Portland Cement Co. operated the Kosmosdale plant throughout the year. Shipments of portland and masonry cements decreased 9 percent and 13 percent respectively, below the record established in 1959. Raw materials used in portland cement included limestone (73 percent), miscellaneous clay (23 percent), gypsum (2 percent), and iron ore (2 percent). Cement produced was mainly consumed within the State, but shipments were also made to Indiana and Ohio. Portland cement was used chiefly by ready-mixed concrete companies, concrete products manufacturers, and building material dealers.

**Clays.**—*Ball Clay.*—Kentucky ranked second in ball-clay production. Kentucky-Tennessee Clay Co., Old Hickory Clay Co., and Kentucky Clay Mining Co. mined ball clay at four mines in Graves County for whiteware, stoneware, art pottery, enameling, floor and wall tile, fire-clay mortar, kiln furniture and other refractories, fillers, and other uses.

*Fire Clay.*—Sixteen companies mined fire clay at 31 mines in Carter, Greenup, and Rowan Counties for firebrick and block, fire-clay mortar, and heavy clay products. Leading producers were General Refractories Co., Harbison-Walker Refractories Co., and North American Refractories Co. Production increased 24 percent but was 47 percent below the 1951 record. Total production was 307,000 tons, valued at $1,846,000.

*Miscellaneous Clay.*—Fourteen companies mined miscellaneous clay at 16 mines in 11 counties for floor and wall tile, heavy clay products, lightweight aggregate, and cement. Leading counties were Jefferson, Bullitt, and Hancock. Leading producers were Kosmos Portland Cement Co., Kenlite Division of Kentucky Light Aggregates, Inc., and Big Run Coal & Clay Co. Production increased 3 percent above the high established in 1959. Total production was 644,000 tons, valued at $800,000.

**Fluorspar.**—Nine companies or individuals mined fluorspar in Caldwell, Crittenden, and Livingston Counties for hydrofluoric acid, glass, ceramics, steel manufacture, and iron foundries. Leading producers were Calvert City Chemical Co. (Dyers Hill mine) and J. Willis Crider Fluorspar Co. (Pigmy mine). Marketable production increased 60 percent but was 81 percent below the 1941 record. Total marketable production was 26,700 tons, valued at $1,215,000. Total cumulative production from earliest records was 2,884,000 tons. Four companies processed or blended fluorspar purchased in Illinois, Kentucky, or Mexico for shipment to consumers. The leading shipper was Kentucky Fluorspar Co. Total shipments to consumers from Kentucky were 36,400 tons, valued at $1,621,000. Total shipments originating in Kentucky were 25,900 tons, valued at $1,173,000. Kentucky was the second largest fluorspar producing state.

**Gem Stones.**—The Majors Rocks collected mineral specimens (flint, fossils, calcite, and pyrite) for souvenirs. Total value reported was $400.

**Sand and Gravel.**—Twenty-three companies mined sand and gravel at 32 mines in 23 counties. Leading counties were Jefferson, Boone, and Henderson. Leading producers were Standard Materials Corp., Bedford-Nugent Co., Inc., and Ohio River Sand Co., Inc. Production increased 1 percent but was 10 percent below the 1956 record. Of the total production, 93 percent was washed, and 73 percent was hauled by truck, 22 percent by water, and 5 percent by rail.

**Stone.**—*Limestone.*—Seventy-one operators crushed limestone at 96 quarries in 56 counties. Leading counties were Jefferson, Livingston, and Oldham. Leading producers were Reed Crushed Stone Co., Inc. (Livingston County), Kentucky Stone Co. (Anderson, Breckinridge, Hardin, Jessamine, Lee, Logan, Rockcastle, and Todd Counties), and

| Total | 16,060,408 | 22,173,610 | 1.38 | 15,807,496 | 21,455,692 | 1.36 |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Other uses."
[2] Includes riprap, fluxing stone, fertilizer filler, cement, other uses, and uses indicated by footnote 1.

Ohio River Stone Co. (Oldham County). Production decreased 2 percent below the record set in 1959. Of the total tonnage, 81 percent was hauled by truck, 9 percent by rail, and 10 percent by water.

*Sandstone.*—Silica Corp. of America crushed sandstone in Pike County for glass and other uses. Kentucky Flagstone Co., Kentucky Kolor Stone, Inc., and Thomas C. Mayne quarried 2,200 tons of dimension sandstone in Logan and McCreary Counties for rough architectural and dressed building stone and for flagging.

**Vermiculite.**—Zonolite Co. exfoliated vermiculite from other States at the Wilder plant.

## METALS

**Ferroalloys.**—Shipments of ferroalloys, including ferromanganese, silicomanganese, silvery pig iron, ferrosilicon, ferrochromium, and ferrochromic-silicon, increased 6 percent.

**Lead.**—Byproduct recovery of lead from fluorspar milling increased 36 percent.

**Pig Iron and Steel.**—Armco Steel Corp. produced foundry and basic pig iron at Ashland; shipments increased to the highest level since 1955. Steel was produced by Armco Steel Corp. at Ashland and by Acme Steel Co. at Newport. Iron ore consumed was 1 percent domestic and 99 percent imported. Imports, mainly from Labrador and Brazil, increased 34 percent and were 29 percent above the previous record, set in 1958.

**Zinc.**—Byproduct recovery of zinc from fluorspar milling increased 29 percent but was 75 percent below the 1951 record.

## REVIEW BY COUNTIES

Of the 120 counties in Kentucky, 106 reported mineral production, compared with 107 in 1959. Leading counties were the large coal and petroleum producers, Hopkins, Pike, Muhlenberg, Harlan, Floyd, Letcher, and Perry, which supplied more than 50 percent of the total State value. In addition to the detailed county production listed in table 9, natural gas and natural gas liquids, of undetermined county origin, were produced.

Digitized by Google

**Adair.**—Shamrock Stone Co., Inc., crushed limestone for concrete, roads, and agstone, at the Butler quarry. Production of crude petroleum increased 30 percent.

**Allen.**—McLellan Stone Co., crushed limestone for concrete, roads, and railroad ballast at the Scottsville quarry. Production of crude petroleum increased 51 percent.

**Anderson.**—Kentucky Stone Co., crushed limestone for concrete, roads, railroad ballast, and agstone at the Tyrone mine.

**Barren.**—J. F. Pace Construction Co., crushed limestone for concrete, roads, and agstone. Production of crude petroleum decreased 11 percent.

**Bath.**—Production of crude petroleum increased 2 percent.

**Bell.**—Ninety-two mines produced coal; leading producers were Kentucky Ridge Coal Co. (Crockett mine), Green Mountain Coal Co. (Green Mountain Strip mine), and Bell-Hi Coal Corp. (No. 1 mine). Production of crude petroleum decreased 28 percent.

[1] Excludes natural gas and natural gas liquids; included with "Undistributed." The following counties did not report production: Bracken, Campbell, Grant, Larue, Lewis, Owen, Robertson, Scott, Shelby, Spencer, and Woodford.
[2] Other than natural gas and natural gas liquids.
[3] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[4] Revised figure.
[5] Includes natural gas, natural gas liquids, and values indicated by footnote 3.

Digitized by Google

**Boone.**—Standard Materials Corp. (Belleview mine) and Kentucky Sand Co. (Taylorsport mine) mined sand and gravel for structural, paving, and fill uses.

**Bourbon.**—Bourbon Limestone Co., Inc. (Snapp quarry) and Hinkle Construction Corp. (Farmers quarry) crushed limestone for concrete, roads, and agstone.

**Boyd.**—Ferguson & Yates Coal Co. (No. 1 mine), Big Run Coal & Clay Co. (Big Run mine), Flo Glo Coal Co. (No. 2–A mine), and Kentucky Eagle Coal & Clay Co. (No. 1 mine) were the active coal producers. Big Run Coal & Clay Co., Inc. (Princess mine) mined miscellaneous clay for heavy clay products. Production of crude petroleum increased 1 percent.

**Boyle.**—Caldwell Stone Co., Inc. (Danville quarry) and Boyle County Highway Department (Perryville quarry) crushed limestone for concrete, roads, and agstone.

**Breathitt.**—Ten coal mines were active; leading producers were Island Creek Coal Co. (No. 3 Elkhorn mine) and Vires Coal Co. (Nos. 5 and 7 mines). Production of crude petroleum decreased 37 percent.

**Breckinridge.**—Kentucky Stone Co. (Webster quarry) and White Stone Co. (Hardinsburg quarry) produced limestone for riprap, concrete, roads, railroad ballast, and agstone. Ohio Valley Corp. mined structural and paving sand and gravel at the Cloverport mine. Murray Tile Co., Inc. (Cloverport mine) mined miscellaneous clay for floor and wall tile. Production of crude petroleum increased 39 percent.

**Bullitt.**—Kenlite Division of Kentucky Light Aggregates, Inc. (Shepherdsville mine) mined miscellaneous clay for producing lightweight aggregate.

**Butler.**—Boonville Coal Sales Corp. (South Hill Strip mine), Skoog & Stuart Coal Co. (Skoog & Stuart mine), and M. R. Melton Coal Co. (Green River No. 2 mine) were the leading coal producers. Seven coal mines were active. Production of crude petroleum decreased 13 percent.

**Caldwell.**—Cedar Bluff Stone Co. (Cedar Bluff mine) and Fredonia Valley quarries, Inc. (Fredonia quarry) crushed limestone for concrete, roads, and agstone. Watson Bridge Mining Co. (Caldwell County Strip mine) was the only coal producer. James H. Cravens mined a small quantity of fluorspar at the Tyree mine.

**Calloway.**—Murray Sand Co., Inc., and the State highway department mined sand and gravel for structural, paving, glass, molding, and refractory uses.

**Carlisle.**—The State highway department mined paving gravel.

**Carroll.**—Standard Materials Co. (Milton mine) and Carrollton Gravel-Sand Co., Inc. (Carrollton mine) mined structural and paving sand and gravel.

**Carter.**—Nineteen mines produced 203,000 tons of fire clay for firebrick and block and fire-clay mortar. The leading producers were the General Refractories Co. Olive Hill Strip mine and the Harbison-Walker Refractories Co. Brinegar Strip mine. Acme Stone Co., Inc., and Standard Slag Co. (Carter quarry) crushed limestone for concrete and roads. Gollihue & Green Coal Co. (No. 4 mine), Willard

Digitized by Google

Coal Co. (No. 4 mine), and Fields Branch Coal Co. (Grayson Block mine) were the active coal producers.

**Casey.**—Casey Stone Co. (Bethel Ridge mine) produced limestone for riprap, concrete, roads, and agstone. A small quantity of crude petroleum was produced.

**Christian.**—Hopkinsville Stone Co., Inc., Harry Berry, Inc., and Christian Quarries, Inc., crushed limestone for concrete, roads, and agstone. Ralph Ligon, Inc., produced coal at the No. 6 Strip mine. Production of crude petroleum increased 29 percent.

**Clark.**—Boonesboro Quarries, Inc., crushed limestone for concrete and roads.

**Clay.**—House Branch Coal Co. (No. 2 mine), Keith & Peters (No. 1 Strip mine), and B. G. & M. Coal Co. (No. 1 Strip mine) were the leading coal producers. There were 82 active coal mines.

**Clinton.**—Shamrock Stone Co. crushed limestone for concrete, roads, and agstone at the Caldwell quarry. Albany Coal Co. (No. 1 mine), Cross Bros. Coal Co. (No. 1 mine), and Massengale & Guinn Coal Co. (No. 1 mine) were the leading coal producers. Six coal mines were active. Production of crude petroleum increased 29 percent.

**Crittenden.**—Alexander Stone Co. (No. 1 quarry) produced limestone for riprap, concrete, roads, and agstone. Marion Mining Co., Inc. (Cook mine) and J. Willis Crider Fluorspar Co. (Pigmy mine) mined barite for use in oil well drilling. J. Willis Crider Fluorspar Co. (Pigmy mine) was the leading producer of fluorspar. Kentucky Fluorspar Co., Roberts & Frazer, and two other brokers purchased fluorspar from local and foreign producers for shipment to a variety of consumers. Calvert City Chemical Co. operated its flotation mill at Mexico, treating fluorspar from its Dyer's Hill mine in Livingston County. Production of crude petroleum decreased 43 percent.

**Cumberland.**—Production of crude petroleum was more than double that of 1959.

**Daviess.**—Green Coal Co. (K–9 Strip mine), Morris Enterprises (Morris Strip mine), and Daviess County Coal Co., Inc. (No. 1 mine) were the leading coal producers. Six coal mines were active. Owensboro River Sand & Gravel Co. and Daviess County Sand & Gravel Co. mined sand and gravel for structural, paving, engine, and fill uses. Joseph L. Clark Tile Co. (Moselyville mine) mined miscellaneous clay for heavy clay products. Production of crude petroleum decreased 12 percent.

**Edmonson.**—McLellan Stone Co. and Nolin Stone Co., Inc., produced limestone for riprap, concrete, roads, and agstone. Production of crude petroleum increased 42 percent.

**Elliott.**—Copley Coal Co. (No. 2 mine) and Ralph Hartman Coal Co. (No. 3 mine) were the active coal producers. Crude petroleum production decreased 17 percent.

**Estill.**—Estill County Stone Co., Inc. (Estill mine) crushed limestone for concrete and roads. Production of crude petroleum decreased 1 percent.

**Fayette.**—Central Rock Co. (Lexington mine and Lexington quarry), Lambert Bros. Division of Vulcan Materials Co., and Blue Grass Stone Co. crushed limestone for concrete, roads, and agstone.

Digitized by Google

**Fleming.**—Gorman Construction Co. crushed limestone for concrete, roads, and agstone at the Carpenter quarry.

**Floyd.**—Floyd County ranked fifth in value of mineral production. Inland Steel Co. (Wheelwright mine) and Princess Elkhorn Coal Co. (No. 2 and Open Fork mines) were the leading coal producers. Three hundred and forty-three coal mines were active. Mare Creek Sand Co., Inc. (Allen mine) mined structural sand. Production of crude petroleum decreased 32 percent.

**Franklin.**—Blanton Stone Co., Inc. (Frankfort mine), Franklin County Stone Co. (Franklin quarry), and Frankfort Builders Supply Co., Inc. (Devil's Hollow mine) produced limestone for riprap, concrete, roads, and agstone. The Majors Rocks collected a small quantity of gem stones (calcite).

**Fulton.**—Hickman Sand & Gravel Co. and the State highway department mined paving sand and gravel.

**Gallatin.**—Standard Materials Corp. (Warsaw mine) and C & H Gravel Co., Inc. (Sam Hill mine) mined structural and paving sand and gravel.

**Graves.**—Four mines produced 102,000 tons of ball clay for use in whiteware, stoneware, art pottery, enameling, floor and wall tile, fire-clay mortar, saggers, pins, stilts, wads, and other uses. The leading producer was Kentucky-Tennessee Clay Co. The State highway department mined paving gravel.

**Grayson.**—Rogers & Brunnhoeffer and Ragland Bros. (Leitchfield quarry) crushed limestone for concrete, roads, and agstone. Production of crude petroleum decreased 53 percent.

**Green.**—Nally & Gibson Stone Co. (Greensburg quarry) crushed limestone for concrete and roads. Production of crude petroleum decreased 70 percent.

**Greenup.**—Nine mines produced 68,000 tons of fire clay for use in firebrick and block, fire-clay mortar, and heavy clay products. The leading producers were M. A. McCoy (Greenup Strip mine), Harbison-Walker Refractories Co. (Riggs mine), and Sparks & Durham Clay Co. Production of crude petroleum decreased 84 percent.

**Hancock.**—Charbon Stripping Co. (Hawesville strip mine) was the only active coal mine. Four mines produced miscellaneous clay for use in floor and wall tile and heavy clay products; leading producer was Cannelton Sewer Pipe Co. Production of crude petroleum decreased 9 percent.

**Hardin.**—Osborne Bros., Kentucky Stone Co., Inc. (Upton quarry and Lilmay mine), and Waters Construction Co. produced limestone for riprap, concrete, roads, railroad ballast, fertilizer filler, and agstone. Production of crude petroleum decreased 74 percent.

**Harlan.**—Harlan County ranked fourth in value of mineral production. United States Steel Co. (No. 32 and Lynch No. 31 mines), Stonega Coke & Coal Co. (Glenbrook High Splint mine), and International Harvester Co. (No. 4 mine) were the leading coal producers. There were 158 active coal mines. A small quantity of crude petroleum was produced.

**Harrison.**—Genet Stone Co., Inc., crushed limestone for concrete, roads, and agstone at the Cynthiana quarry.

615629—61——29

Digitized by Google

**Hart.**—McLellan Stone Co. crushed limestone for concrete, roads, and agstone at the Horse Cave quarry. Production of crude petroleum was more than five times that reported for 1959.

**Henderson.**—Dolph Hazelwood Coal Co. (Mike & Pat mine), Community Coal Co. (Community mine), and Henderson Mining Co., Inc. (No. 1 Henderson mine) were the leading coal producers. There were 10 active coal mines. Bedford-Nugent Co., Inc., mined sand and gravel for structural, paving, and fill uses. Production of crude petroleum increased 1 percent.

**Henry.**—Geoghegan & Mathis, Inc., crushed limestone for concrete, roads, and agstone. The Majors Rocks collected a small quantity of gem stones (flint and fossils).

**Hickman.**—The State highway department mined 26,000 tons of paving gravel.

**Hopkins.**—Hopkins County led in value of mineral production. West Kentucky Coal Co. (Pleasant View mine), Peabody Coal Co. (White City Strip mine), and Coiltown Mining Co. (Coiltown mine) were the leading coal producers. There were 43 active coal mines. Green River Clay Products mined miscellaneous clay for heavy clay products at the Ashbyburg mine. Production of crude petroleum decreased 27 percent.

**Jackson.**—Moore Coal Co., Inc. (Moore No. 4 mine), Walker Harrison Coal Co. (No. 1 mine), and Marcum Coal Co. (Travis Creek Strip mine) were the leading coal producers. Nineteen coal mines were active. M. A. Walker & Co. crushed limestone for concrete and roads at the Clover Bottom and Indian Creek mines. Production of crude petroleum was more than double the 1959 production.

**Jefferson.**—Kosmos Portland Cement Co. produced masonry and portland cements at the Kosmosdale mill. Limestone was crushed at six quarries and one mine for concrete, roads, railroad ballast, and agstone. The leading producers were Louisville Crushed Stone Co. (Louisville mine), Louisville Sand & Gravel Co., and Falls City Stone Co. (Fern Creek quarry). Six mines produced structural, paving, fertilizer filler, and fill sand and gravel; leading producers were Ohio River Sand Co., Inc., and E. T. Slider Co., Inc. Kosmos Portland Cement Co. (Kosmosdale mine) and General Shale Products Co. (Coral Ridge mine) mined miscellaneous clay for cement and heavy clay products.

**Jessamine.**—Kentucky Stone Co. crushed limestone for concrete, roads, agstone, and railroad ballast at the High Bridge mine.

**Johnson.**—Tutor Key Coal Co. (No. 132 mine), Whitten Coal Co. (No. 8 mine), and Victoria Mining Co. (No. 2 mine) were the leading coal producers of the 58 active mines. Production of crude petroleum decreased 8 percent.

**Kenton.**—The Franxman Bros. crushed limestone for concrete and roads at the Covington quarry.

**Knott.**—Co-Dee Coal Co. (No. 3 Auger mine), Pine Bluff Coal Co. (No. 1 mine), and Riddle Coal Co., Inc. (Walkers Branch mine) were the leading coal producers of the 178 active mines. Production of crude petroleum increased 30 percent.

**Knox.**—Kentucky Knox Mining Co., Inc. (No. 1 Strip and No. 1 Auger mines) and F & M Coal Co. (No. 1 Strip mine) were the leading

Digitized by Google

coal producers of the 82 active mines. Production of crude petroleum more than tripled that of 1959.

**Laurel.**—Engle Mining Co. (No. 2 mine), Margin Coal Co. (No. 2 mine), and A. A. Fuson Coal Co. (No. 2 Strip mine) were the leading coal producers of the 16 active mines. Production of crude petroleum decreased 72 percent.

**Lawrence.**—Phillip Preece, Jr., Coal Co. (No. 1 Strip mine) and Thomson & Polly Coal Co. (No. 1 mine) were the leading coal producers of the 6 active mines. Production of crude petroleum increased 18 percent.

**Lee.**—Congleton Bros., Inc. (Pacemaker mine), Kentucky River Collieries, Inc. (No. 15 mine), and Cave Branch Coal Co. (No. 1A mine) were the leading coal producers of the 8 active mines. Kentucky Stone Co. crushed limestone for concrete, roads, railroad ballast, and agstone at the Yellow Rock mine. Production of crude petroleum increased 31 percent.

**Leslie.**—Deby Coal Co. (Deby No. 2 and Deby No. 3 mines), Mary Gail Coal Co. (No. 7 mine), Shamrock Coal Co. (No. 8 mine), and Lynn Mining Co. (No. 1 mine) were the leading coal producers. Forty-nine mines were active. Production of crude petroleum increased 11 percent.

**Letcher.**—Letcher County ranked sixth in value of mineral production. Bethelehem Mines Corp. (No. 22 mine), South East Coal Co. (Big Chief mine), and United States Steel Corp. (Lynch No. 31 mine) were the leading coal producers. There were 235 active coal mines. Hurricane Gap Quarries, Inc., crushed limestone for concrete and roads. Production of crude petroleum increased substantially over the amount reported for 1959.

**Lincoln.**—Production of crude petroleum increased 38 percent.

**Livingston.**—Reed Crushed Stone Co., Inc., produced limestone for riprap, concrete, roads, agstone, and railroad ballast at the Grand Rivers quarry. Calvert City Chemical Co. (Dyer's Hill mine) and Atwood Mining Co. (Atwood mine) mined fluorspar for metallurgical uses and for manufacturing hydrofluoric acid. Byproduct zinc and lead were recovered from fluorspar milling. The State highway department mined paving gravel.

**Logan.**—Kentucky Stone Co. crushed limestone for concrete, roads, railroad ballast, and agstone at the Russellville mine. Kentucky Flagstone Co. (Lewisburg quarry) and Kentucky Kolor Stone Corp. (Russellville quarry) quarried dimension sandstone for rough and dressed building stone and for flagging. Production of crude petroleum decreased 18 percent.

**Lyon.**—The State highway department mined paving gravel.

**Magoffin.**—Trusty Coal Co. (No. 2 mine), Tip Top Coal Co. (No. 8 mine), and Wiley Harper Coal Co. (No. 1 mine) were the leading coal producers. Ten coal mines were active. Production of crude petroleum decreased 12 percent.

**Marion.**—Ward & Montgomery (Lebanon quarry) and Lebanon Stone Co. crushed limestone for concrete, roads, and agstone. Marion County Highway Department mined paving gravel.

**Marshall.**—The State highway department mined paving gravel.

Digitized by Google

**Martin.**—Webbs Coal & Mining Co. (No. 2 mine), Warfield Mining Co. (No. 1 mine), and S & K Coal Co. (No. 2 mine) were the leading coal producers. Five coal mines were active. Production of crude petroleum decreased 4 percent.

**Mason.**—J. F. Hardymon Co. mined structural, paving, and fill sand and gravel.

**McCracken.**—Federal Materials Co., Inc., mined structural sand and gravel at the Paducah mine.

**McCreary.**—Stearns Coal & Lumber Co. (No. 18 and No. 16–2 mines) and B. R. Campbell & Son, Inc. (Campbell Strip mine) were the leading coal producers. Ten coal mines were active. Thomas C. Mayne quarried dimension sandstone for rough and dressed building stone at the Day Ridge quarry. Production of crude petroleum increased 7 percent.

**McLean.**—Highview Coal & Construction Co. (Centertown No. 1 Strip mine) was the only coal producer. Production of crude petroleum decreased 14 percent.

**Meade.**—Kosmos Portland Cement Co. (Hartford quarry) and Owensboro River Sand & Gravel Co. (Riverside mine) crushed limestone for cement, concrete, roads, and agstone.

**Menifee.**—A. W. Walker & Son crushed limestone for concrete and roads at the Frenchburg quarry. America Coal Co. (No. 1 mine) was the only coal producer. Production of crude petroleum decreased 53 percent.

**Mercer.**—Mercer Stone Co. and Mercer County Highway Department crushed limestone for concrete, roads, and agstone.

**Metcalfe.**—Montgomery & Co. crushed limestone for concrete, roads, and agstone at the Chapman quarry. Production of crude petroleum decreased 33 percent.

**Monroe.**—Trico Stone, Inc., crushed limestone for concrete, roads, and agstone at the Monroe quarry. Production of crude petroleum increased substantially over the amount reported for 1959.

**Montgomery.**—A small quantity of crude petroleum was reported.

**Morgan.**—Licking River Limestone Co. (Zag quarry), Kentucky Road Oiling Co. (Wrigley quarry), and Morgan County Limestone, Inc., crushed limestone for concrete, roads, and agstone. Marshall & Sheets Coal Co. (No. 1 Strip mine) and Marsillett Coal Co. (Nos. 9 and 11 mines) were the leading coal producers. Six coal mines were active. Production of crude petroleum increased 18 percent.

**Muhlenberg.**—Muhlenberg County ranked third in value of mineral production. River Queen Coal Co. (River Queen Strip mine), Peabody Coal Co. (Vogue Strip mine), and Gibralter Coal Corp. (Gibralter Strip mine) were the leading coal producers. There were 22 active coal mines. Greenville Quarries, Inc., crushed limestone for concrete, roads, and agstone. Production of crude petroleum decreased 10 percent.

**Nelson.**—Geoghegan & Mathis crushed limestone for concrete, roads, and agstone at the Nelson quarry.

**Nicholas.**—Nicholas County Highway Department crushed limestone for concrete and roads..

**Ohio.**—Peabody Coal Co. (Ken Strip and Ken Highwall No. 2 mines) and Riverview Coal Co. (No. 1 Strip mine) were the leading

Digitized by Google

coal producers. Twenty-four coal mines were active. Fort Hartford Stone Co .and State Contracting & Stone Co. produced limestone for riprap, concrete, roads, railroad ballast, and agstone. Production of crude petroleum decreased 1 percent.

**Oldham.**—Ohio River Stone Co., Joe Clark Stone Co., and W. T. Liter (Crestwood mine) crushed limestone for concrete, roads, and agstone.

**Owsley.**—The Wilmuth Corp. (Early Bird Strip mine) and Reynolds Coal Co. (No. 3 mine) were the two active coal producers. Production of crude petroleum more than doubled that reported for 1959.

**Pendleton.**—Geoghegan & Mathis crushed limestone for concrete, roads, and agstone at the Butler and Falmouth quarries.

**Perry.**—Perry County ranked seventh in value of mineral production. Blue Diamond Coal Co. (Leatherwood Nos. 1 and 2 mines) and Jewel Ridge Coal Corp. (Blair Fork mine) were the leading coal producers. There were 107 active coal mines. Production of crude petroleum increased substantially over the amount reported for 1959.

**Pike.**—Pike County ranked second in value of mineral production. Eastern Coal Corp. (Stone mine), Republic Steel Corp. (Republic mine), and Kentland-Elkhorn Coal Co. (Kentland No. 1 mine) were the leading coal producers. There were 474 active coal mines. Pike Sand Co. (Walters mine) mined structural sand. Silica Corp. of America crushed sandstone for glass and miscellaneous uses. Production of crude petroleum decreased 16 percent.

**Powell.**—A. W. Walker & Son crushed limestone for concrete and roads at the Whiterock quarry. Big Run Coal Co. and H. B. Sipple Brick Co. (Faulkner No. 1 mine) mined miscellaneous clay for heavy clay products. Production of crude petroleum increased 63 percent.

**Pulaski.**—Ikerd & Bandy Coal Co., Inc. (No. 3 Strip mine) and Mount Victory Coal Co. (No. 1 mine) were the leading coal producers. Eleven coal mines were active. Somerset Stone Co., Inc. (Somerset quarry) and Strunk Construction Co. (Tateville quarry) crushed limestone for concrete, roads, and agstone.

**Rockcastle.**—Black Foot Coal Co. (No. 2 mine) and Low Ash Coal Co. (No. 1 mine) were the leading coal producers. Five coal mines were active. Kentucky Stone Co. (Mt. Vernon and Mullins mines) crushed limestone for concrete, roads, railroad ballast, and agstone. Initial production of crude petroleum was reported.

**Rowan.**—Morehead Limestone Co. and Kentucky Road Oiling Co. (Christy quarry) crushed limestone for fluxing stone, concrete, roads, and agstone. General Refractories Co. (Johnson and Caudill mines) mined fire clay for firebrick and block. Lee Clay Products Co., Inc. (Lee Clay mine) mined miscellaneous clay for heavy clay products.

**Russell.**—Production of crude petroleum increased substantially over the amount reported for 1959.

**Simpson.**—Southern Stone Co., Inc., crushed limestone for concrete, roads, and agstone at the Franklin quarry. Production of crude petroleum increased 31 percent.

**Taylor.**—Production of crude petroleum increased 59 percent.

**Todd.**—Kentucky Stone Co., Inc. (Todd quarry) and D. W. Dickinson & Son (Gallatin quarry) crushed limestone for concrete, roads, and agstone. Production of crude petroleum decreased 5 percent.

Digitized by Google

**Trigg.**—Cedar Bluff Stone Co., Inc., crushed limestone for concrete, roads, and agstone at the Canton and Cerulean quarries.

**Trimble.**—The Majors Rocks collected a small quantity of gem stones (pyrite).

**Union.**—Nashville Coal Co., Inc. (Uniontown mine), Pittsburg & Midway Coal Mining Co. (Dekoven mine), P & S Coal Co. (No. 1 Strip mine), and Louis F. Chapman (No. 1 Strip mine) were the active coal producers. Union Sand & Gravel Co. mined structural and paving sand and gravel. Clarks Clay Products Co. mined miscellaneous clay for heavy clay products. Production of crude petroleum increased 4 percent.

**Warren.**—McLellan Stone Co. (Warren and Smith Grove quarries) and Gary Bros. Crushed Stone Co. crushed limestone for concrete, roads, and agstone. Production of crude petroleum increased 3 percent.

**Washington.**—Nally & Gibson crushed limestone for concrete and roads.

**Wayne.**—Bassett Products Co. crushed limestone for concrete, roads, and agstone. Thomas Jones Coal Co. (No. 1 mine) and Lewis Roberts Coal Co. (No. 1 mine) were the only active coal producers. Production of crude petroleum increased 6 percent.

**Webster.**—Hart & Hart Coal Co. (Precision Washed Strip mine) and Russell Badgett Coal Co. (Choctaw Strip mine) were the leading coal producers. Seven coal mines were active. Production of crude petroleum decreased 4 percent.

**Whitley.**—Round Mountain Coal Co., Inc. (No. 1 Strip mine), Whitley Strip Mining Co., Inc. (Whitley Strip mine), and Reaves Dixie Gem Coal Co. (No. 3 mine) were the leading coal producers. Fifty coal mines were active. Corbin Brick Co. mined miscellaneous clay for heavy clay products. Production of crude petroleum increased substantially over the amount reported for 1959.

**Wolfe.**—C. L. Thompson Coal Co. (Miller mine), Perry Coal Co. (No. 1 mine), and Vancleave & Gibbs Coal Co. (No. 1 mine) were the active coal producers. Production of crude petroleum decreased 21 percent.

# The Mineral Industry of Louisiana

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Louisiana Geological Survey.**

By Peter Grandone [1] and Leo W. Hough [2]

LOUISIANA ranked second among the States in value of mineral production for the third consecutive year. To keep pace with Louisiana's accelerated industrial development, new records were made in output of crude petroleum, natural gas, natural gas liquids, and sulfur (in order of value).

The Louisiana mineral industry was dominated by crude petroleum, natural gas, and natural gas liquids, which furnished 94 percent of the total value of mineral output. Proved recoverable reserves of these fuels reached new highs despite increased production. In quantity of reserves added during 1960, Louisiana ranked first in the Nation for petroleum and natural gas and second for natural gas liquids. Nationally, recoverable reserves showed gains for natural gas and natural gas liquids and a loss for petroleum.

**TABLE 1.—Mineral production in Louisiana [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clay.....thousand short tons.. | [2] 904 | [2] $904 | 749 | $749 |
| Natural gas.....million cubic feet.. | 2,670,271 | 411,222 | 2,988,414 | 511,019 |
| Natural gas liquids: | | | | |
| Natural gasoline and cycle products thousand gallons.. | 846,110 | 60,295 | 875,567 | 66,214 |
| LP gases.....do.... | 540,046 | 25,877 | 606,023 | 28,147 |
| Petroleum (crude)..thousand 42-gallon barrels.. | 362,666 | 1,145,569 | [3] 394,360 | [3] 1,237,823 |
| Salt.....thousand short tons.. | 4,807 | 20,918 | 4,792 | 21,959 |
| Sand and gravel.....do.... | 16,052 | 20,111 | 14,319 | 19,106 |
| Stone (shell).....do.... | 5,670 | 10,874 | 4,691 | 8,882 |
| Sulfur (Frasch-process)...thousand long tons.. | 2,252 | 52,779 | 2,256 | 52,639 |
| Value of items that cannot be disclosed: Cement, bentonite (1959), gypsum, lime, and miscellaneous stone..... | ---------- | 20,286 | ---------- | 24,042 |
| Total Louisiana [4].....---------- | ---------- | [5] 1,766,269 | ---------- | 1,967,652 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Excludes bentonite, included with "Value of items that cannot be disclosed."
[3] Preliminary figure.
[4] Total adjusted to eliminate duplicating value of clays used for cement and shell used in manufacturing lime and cement.
[5] Revised figure.

Construction of new plants and additions to existing petrochemical plants, natural gasoline plants, and refineries continued at a high level throughout the year. The Louisiana State Board of Commerce and Industry approved a total investment of $188 million in applications for new manufacturing plants and expansions of existing plants in 1960. Applications approved in 1959 for new industrial facilities had totaled $133 million. Also in 1960, the Board approved 180 industrial applications for ad valorem tax exemptions on new facilities. Of the total, 58 were for completely new manufacturing plants.

Among new industries coming to Louisiana was the $50 million petrochemical complex at Geismar, operated by Monochem, Inc., which was jointly owned by The Borden Co. and U.S. Rubber Co.

Freeport Sulphur Co. commenced operating its $30 million offshore mining platform in the Gulf of Mexico near Grand Isle. The huge facility, capable of producing 4,500 tons of molten sulfur daily, was connected to storage tanks on Grand Isle by a $2 million pipeline.

The Mississippi River is one of the greatest industrial attractions to the Baton Rouge-New Orleans area. The river is the largest freshwater supply in the United States, with an annual flow of over 300 billion gallons a day—more water than is used in the entire Nation. The river is navigable for large ocean-going vessals as far as Baton Rouge, and provides low-cost barge transportation to stations on the Mississippi, Ohio, Illinois, and Missouri Rivers.

The first phase of construction was completed on the Port of New Orleans bulk unloading facility on the new Mississippi River-Gulf Outlet. The terminal was capable of unloading, storing, and transferring bulk materials such as ores, sand, gravel, rock, shell, and coal. Bestwall Gypsum Co., first industry to contract for use of the unloading facility, constructed a $6 million wallboard plant on a 30-acre site adjacent to the terminal. The Mississippi River-Gulf Outlet will shorten the distance between New Orleans and the Gulf by 50 miles and will provide one-way ship traffic by 1962 and two-way traffic when fully completed in 1969.

Elsewhere, construction of two other major canal and docking facilities was announced. The Houma Navigation Canal from Houma to the Gulf, designed exclusively for barge traffic, was to be enlarged to take deep-water vessels. When completed, it was expected to make Houma a major terminus on the Gulf Intercoastal Waterway and open the area to further industrial development. Near Morgan City, a $50 million industrial marine complex to be known as Acadian Gateways was planned for a 16,000-acre tract bordering Bayou Black—an outlet to the Gulf and to the Intercoastal Canal.

To keep pace with industrial expansion, several Louisiana power and light companies were building new steam-electric generating stations and were adding generating units to existing stations. At St. Gabriel in Ascension Parish, Gulf States Utilities Co. dedicated the first 165,000 kilowatt generating unit at its $22 million Willow Glen plant. Future planning included the addition of a 220,000 kilowatt unit about 1965.

Legislation.—The U.S. Supreme Court issued a formal decree on December 12 to carry out its Gulf Coast tidelands oil decision of May.

Digitized by Google

The decree provided that Texas and Florida were entitled to the rich undersea deposits to a distance of 10½ statute miles, or 3 leagues. Louisiana, Alabama, and Mississippi were confined to the usual offshore boundary of 3 geographical miles.

The State and Federal Governments were making a joint survey to determine the physical measurements of the shoreline; subsequently about $308 million, held in escrow by the Federal Government under a separate agreement between the two parties signed on October 12, 1956, will be divided.

On May 31, the State Legislature passed a $55 million gas severance tax bill. The 2.3 cent tax per 1,000 cubic feet of gas produced was scheduled to expire August 1. The new bill extended it to June 30, 1964.

**Employment.**—Employment in the petroleum industry in 1960 was 85,860 workers—2,890 less than in 1959. In production of minerals, including fuels, employment in establishments with four or more employees was down 3.8 percent and wages were down 3.3 percent from 1959. Oil and gas operations provided 91 percent of the employment and 93 percent of the wages in 1960.

Approximately 17,000 persons were employed in manufacturing chemicals and allied products from petroleum, the largest manufacturing industry in the State. The annual payroll of these chemical industries was nearly $100 million as reported by the manufacturing Chemists' Association. However, it is difficult to segregate employment between petrochemical plants and petroleum refineries because some refineries also produce petrochemicals.

As reported by the Louisiana Department of Commerce and Industry, construction of 58 new plants and expansion of 122 facilities (various industries) in 1960 created 3,800 permanent jobs. Employment for building these facilities in 1960 was 4,156 for the 58 new plants and 5,588 for the 122 expansions.

**TABLE 2.—Employment and wages in the mineral industries [1]**

| Industry | Average number of workers | | Total wages and salaries (thousands) | |
|---|---|---|---|---|
| | 1959 | 1960 [2] | 1959 | 1960 [2] |
| Crude petroleum production, natural gas, and natural gas liquids | 20,067 | 19,720 | $137,221 | $135,488 |
| Oil- and gas-field contract services [3] | 21,806 | 20,456 | 118,444 | 110,908 |
| Sand and gravel pits and dredges | 1,450 | 1,390 | 5,556 | 5,103 |
| Salt mines | 800 | 795 | 3,609 | 3,707 |
| Nonmetallic minerals [4] | 1,550 | 1,580 | 10,095 | 10,621 |
| Total | 45,673 | 43,941 | 274,925 | 265,827 |

[1] The Louisiana Unemployment Compensation Law covers four or more employees.
[2] Preliminary figures.
[3] Includes approximately 3,300 formerly in service industries. The additional item is geophysical services.
[4] Mainly sulfur, excludes shell production workers.

# REVIEW BY MINERAL COMMODITIES

## MINERAL FUELS

Louisiana was again a leading domestic producer of crude petroleum and natural gas and remained a major supplier of natural gas liquids and refined petroleum products.

Annual offshore leasing of mineral rights was held on February 24, and high bids totaling a record $285 million were accepted for 173 tracts of disputed Louisiana tidelands by a joint six-man committee representing the Louisiana Mineral Board and the Federal Bureau of Land Management. Onshore leasing also was in the spotlight, as one of the largest transferrals of producing property in the Louisiana history of oil and gas business was completed. Tennessee Gas Transmission Co. paid Pan American Petroleum Co. about $150 million for 10 leases in the Bastian Bay area of Plaquemines Parish. The properties involved 11 producing gas wells and 13 producing oil wells.

Despite depressed oil markets, regulatory uncertainties, and higher costs of drilling, the offshore oil industry staged a remarkable recovery from the recession that began in 1957. Development of the prolific

South Pass Block 24 Field dramatized the growing importance of the controversy-ridden Louisiana tidelands. Fifty-six drilling rigs operated offshore in 1960, compared with a low of 33 rigs in 1958. New, faster drilling techniques were used to overcome the higher costs of drilling in tidelands. Offshore production rose to one-fifth of the State oil (crude oil and field condensate) output and about one-eighth of the State natural gas production. Enthusiasm about the tidelands continued because these areas were considered most promising for development of domestic oil and gas.

**Exploration and Reserves.**—The number of wells drilled for petroleum and natural gas—3,712—was 2 percent less than in 1959. Statewide drilling of 968 exploratory wells (3 less than in 1959) proved 26 percent productive (28 percent in 1959) and led to discovery of 60 oil or natural gas fields, 13 oil and 4 gas discoveries were in north Louisiana, 19 oil and 18 gas discoveries were in south Louisiana, and 1 oil and 5 gas discoveries were offshore.

The Oil and Gas Journal reported that 28.7 million feet of hole was drilled during the year, only slightly less than the footage drilled in 1959 and 4 percent less than the record footage drilled in 1957.

Although total wells drilled and total wells completed dropped in 1960, the success ratio of exploratory wells was outstanding. Offshore, gains were made for number of exploratory wells drilled and number of exploratory wells completed.

The number of rigs operating offshore averaged 55 in 1960 and 49 in 1959; for the entire State, the average number was 287 in 1960 and 332 in 1959.

A report published by the Louisiana Geological Survey was expected to stimulate new interest in Sabine Parish and promote more exploration for oil and gas. Subsurface data for the study was obtained from logs of recently drilled deep wells. Although oil was the principal natural resource for the parish, the report included information on lignite, glauconite, and bentonite found in the area.[3]

Proved recoverable reserves of crude petroleum, natural gas, and natural gas liquids reached a new high despite increased withdrawal of each. Much of the increase in reserves came from extensions and revisions of previous estimates involving pools and fields discovered before 1960. The State petroleum reserves increased 125 million barrels (largest gain in the Nation) to a new record total of 4,785 million barrels (15 percent of the Nation's total oil reserves). About 30 percent of the crude petroleum reserve was offshore, compared with 30 percent in 1959 and 27 percent in 1958. Natural gas reserves increased 3.5 trillion cubic feet (the net increase for the United States was 1.2 trillion cubic feet) to a new record total of 63.4 trillion cubic feet (24 percent of the U.S. total natural gas reserve). Natural gas liquids reserve increased 75 million barrels (26 percent of the U.S. net increase) to a new record total of 1,433 million barrels (21 percent of the U.S. total).

**Carbon Black.**—Facilities added in 1959, by Continental Carbon Co., resulted in a 5-percent gain in the 1960 output of carbon black. The product was mainly used as an additive in rubber manufacturing.

TABLE 7.—Carbon black production

| Year | Million pounds | Year | Million pounds |
|---|---|---|---|
| 1951–55 (average) | 353 | 1958 | 503 |
| 1956 | 538 | 1959 | 599 |
| 1957 | 534 | 1960 | 631 |

**Natural Gas.**—Marketed production of natural gas continued a strong upward trend for the 15th consecutive year and Louisiana retained second position in the United States as a supplier of natural gas. National demand, both as a fuel and as a raw material, for petrochemicals continued to grow rapidly. Construction of offshore pipelines was continued to provide a market outlet for added gas reserves.

About 18 percent of the natural gas production was credited to north Louisiana (20 percent in 1959); 68 percent to south Louisiana (unchanged from 1959); and 14 percent to the offshore area (12 percent in 1959).

J. R. McDermott & Co., Inc., completed five shut-in gas wells and commenced a sixth well in the Block 68 Field, West Cameron Area, offshore Louisiana, then signed a gas-sale contract with Tennessee Gas Transmission Co. covering the reserves. The initial price to be paid by Tennessee was 22 cents per thousand cubic feet plus 1.8 cents per thousand cubic feet tax reimbursement. Under the contract the initial minimum delivery quantity per day would be an estimated 20 million cubic feet. The contract was subject to Federal Power Commission approval.

In the Eugene Island area, offshore from St. Mary Parish, the industry was drilling and completing multiple-zone wells with as many as five producing strings of pipe in each. The world's first quintuple producing well was completed by Sinclair Oil & Gas Co. and Associates in 72 feet of water at No. 6 Block 190 well. The operator completed the well in six zones, five of which may produce simultaneously. Five parallel 2-inch tubing strings with six packers were run inside the 9⅝-inch casing. On calculated open-flow potential tests, six zones of the Pliocene formation (depth of 6,156 to 7,104 feet) produced at the rate of 492 million cubic feet of gas per day. The five tubing strings will permit Sinclair to produce five zones simultaneously. The No. 2 zone was isolated by the additional packer to allow this zone to be produced alternately with No. 1 zone or when the lowest sand has been depleted.

**Natural Gas Liquids.**—Louisiana ranked second as a producer of natural gas liquids. Natural gasoline and cycle products were recovered by 78 plants (7 more than in 1959) in 30 parishes. Increased output of total condensable liquids was attributed mainly to a gain in natural gas produced and processed, especially casinghead gas from oil wells. A 12-percent gain (31 percent in 1959) by LP gases represented most of the increased output of condensable liquids. This confirmed the trend in natural gasoline plans to remove more butane from natural gasoline, then process the remaining heavier

| 1960 | 2,691,000 | 622,000 | 3,313,000 | 2,988,414 | 511,019 | 219,441 | 105,145 |

[1] Marketed production plus quantities used in repressuring, vented, and wasted.
[2] Comprises gas sold or consumed by producers, including losses in transmission, amounts added to storage, and increases in gas in pipelines.
[3] Partly estimated. Includes direct waste on producing properties and residue blown to the air.
[4] Revised figure.

components to higher quality blending stocks for motor fuels. The LP gas consumption pattern changed in recent years, more in favor of chemical and fuel uses and less for blending into motor fuels at refineries.

To provide for rapid development of new gas supplies, the industry constructed vast facilities for processing natural gas and for recovering, delivering, and storing plant liquids. Union Oil Co. of California and Goliad Corp. installed a $13 million system for gas

Digitized by Google

processing and liquid recovery. One plant at Cow Island in Vermilion Parish could process 450 million cubic feet of gas daily and recover 295,000 gallons of liquids. The raw liquids were delivered through an 88-mile pipeline to a fractionating plant at Geismar, a few miles south of Baton Rouge, where the hydocarbon components were separated for petrochemical charge stock. Also in Vermilion Parish, Phillips Petroleum Co. put in operation a jointly owned natural gasoline plant which processed about 45 million cubic feet of natural gas daily from the the North Erath field.

**TABLE 11.—Natural gas liquids production**

(Thousand gallons and thousand dollars)

| Year | Natural gasoline and cycle products | | LP gases | | Total | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| 1951-55 (average) | 688,396 | $53,338 | 291,065 | $12,972 | 979,461 | $66,310 |
| 1956 | 773,949 | 62,394 | 305,222 | 14,727 | 1,079,171 | 77,121 |
| 1957 | 775,009 | 63,956 | 335,142 | 14,888 | 1,110,151 | 78,844 |
| 1958 | 783,099 | 50,371 | 410,869 | 21,435 | 1,193,968 | 71,806 |
| 1959 | 846,110 | 60,295 | 540,046 | 25,877 | 1,386,156 | 86,172 |
| 1960 | 875,567 | 66,214 | 606,023 | 28,147 | 1,481,590 | 94,361 |

At Grand Chenier in Cameron Parish, the CATC group (comprised of Continental Oil Co., Atlantic Refining Co., Tidewater Oil Co., and Cities Service Co.) put a $1.3 million gasoline plant in operation. The plant, operated by Continental Oil Co., processed about 175 million cubic feet of gas daily from the East and West Cameron fields.

In Acadia Parish, Union Texas Natural Gas Corp. installed two large absorbing towers at its gasoline plant. Runnels Gas Products Co. announced a $7 million expansion program at its Tepetate plant—completion was scheduled for early 1961.

In Terrebonne Parish, Tidewater Oil Co. built a natural gasoline plant to process 75 million cubic feet of gas daily from the Hollywood-Houma fields. About 1,030 barrels of plant liquids were recovered daily.

Continental Oil Co. announced a $2 million construction program to increase the processing capacity of its Lake Charles plant from 100 to 150 million cubic feet of natural gas daily. Completion was scheduled for January 1961. Shell Oil Co. announced plans for building a natural gasoline plant at the mouth of the Mississippi River, on Southwest Pass, to process gas from the firm's South Pass Blocks 24 and 27 oilfields.

At the Sorrento salt dome in Ascension Parish, Esso Standard, Division of Humble Oil & Refining Co., drilled a sixth well to enlarge the total storage capacity for plant liquids in the salt dome caverns to 1.8 million barrels. Also at Sorrento, Shell Oil Co. announced plans to begin an underground cavern at a depth of 3,300 feet, capable of storing 425,000 barrels of liquid butane for use by the company's Norco refinery.

**Petroleum.**—The petroleum industry in Louisiana established a new production record of 394 million barrels in 1960—second highest output in the Nation. The gain, 9 percent over 1959, came from new

Digitized by Google

offshore and onshore discoveries. About 11 percent of the crude oil was produced in north Louisiana, 67 percent in south Louisiana, and 22 percent in the offshore area—about the same distribution as in 1959.

To balance production with expected demand, the State Conservation Commission reduced petroleum allowables on May 1 from 977,153 to 938,170 barrels per day. This reduction, the first since September 1, 1958, represented a cut of the State's producing capacity set in 1953, based on the depth-bracket formula. Although the reduced allowable based on the formula remained in effect throughout the remainder of 1960, actual daily production, due to completions of new wells, advanced at such a rate that it became necessary to raise the volume allowable to 968,056 barrels per day on September 1, and again to 982,467 barrels per day on November 1. Also, the ban on multiple completion of wells, effective in June, was canceled on September 1 to obviate drilling unnecessary wells to each producing zone.

**TABLE 12.—Crude petroleum production**

(Thousand barrels and thousand dollars)

| Year | Quantity | Value | Year | Quantity | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 250,082 | $699,314 | 1959 | 362,666 | $1,145,569 |
| 1956 | 299,421 | 877,951 | 1960 [1] | 394,360 | 1,237,823 |
| 1957 | 329,896 | 1,094,402 | | | |
| 1958 | 313,891 | 1,023,517 | Total: 1902–60 | 5,510,614 | 12,885,533 |

[1] Preliminary figures.

According to a survey,[4] Louisiana had 9,182 oil wells classified as stripper wells. For the year covered, stripper wells represented 41 percent of total oil wells, but supplied only 3.4 percent of the annual production and 3.6 percent of the recoverable oil reserves. Thus, normal production decline from stripper wells was not expected to affect appreciably productive capacity and reserves in the immediate future.

Operations in the tidelands led to innovations in production practice as industry attempted cost reductions. The California Co. installed a 20,000 barrel underwater oil storage unit at its operations

**TABLE 13.—Crude petroleum production, indicated demand, and stocks, in 1960, by months**

(Thousand barrels)

| Month | Production | Indicated demand | Stocks (end of month) | Month | Production | Indicated demand | Stocks (end of month) |

in the Eugene Island Block 110 field. Oil production from the field, about 1,100 barrels per day, was stored in the submerged unit and barged to land in 10,000 barrel lots.

Shell Oil Co. announced a subsurface technique for producing oil wells in offshore waters. The new method eliminates surface platforms and permits installation of equipment for controlling the flow of oil and gas on the bottom of the sea. The first well using the new technique was completed in December under 56 feet of water.

**TABLE 14.—Number of producing oil wells and average production per well**

| Year | Number of producing wells Dec. 31 | Average production per well per day (barrels) | Year | Number of producing wells Dec. 31 | Average production per well per day (barrels) |
|---|---|---|---|---|---|
| 1951–55 (average) | 14,956 | 48.1 | 1958 | 23,070 | 38.1 |
| 1956 | 20,905 | 41.2 | 1959 | 23,468 | 41.8 |
| 1957 | 21,945 | 42.2 | 1960 [1] | 23,409 | 46.0 |

[1] Preliminary figures.

**Refineries.**—At the beginning of 1960 there were 12 operating and 1 inactive petroleum refineries in Louisiana. The crude oil capacity (barrels a day) was as follows: Operating, 760,500; standby, 8,500; and building, 11,000. Cracked gasoline capacity (barrels a day) was as follows: Operating, 238,200; shut down, 26,000; and building, 500.

Modernization of the Bay Petroleum Co., Division of Tennessee Gas Transmission Co., Chalmette refinery, was completed, and its crude oil capacity was increased from 26,000 to 37,000 barrels a day.

Esso Standard, Division of Humble Oil & Refining Co., Baton Rouge, increased fluid catalytic cracking capacity from 141,000 to 142,500 barrels daily and recycling capacity from 59,000 to 60,800 barrels a day.

The trend in the larger refineries was to install additional facilities to recover byproducts, especially aromatics, and to manufacture petrochemicals. Refiners who added substantial petrochemical capacity during the year were Bay Petroleum Co. at Chalmette, Esso Standard at Baton Rouge, and Cities Service Co. and Continental Oil Co. at Lake Charles.

Crude oil runs to stills of the refineries totaled 243 million barrels (about 6 percent less than in 1959) and represented about 62 percent of the State's annual production of crude oil.

**Petrochemicals.**—The petrochemical industry continued to place more emphasis on market development as existing domestic markets were approaching saturation and export markets were falling off because foreign countries were developing their own petrochemical facilities.

According to a survey by the Oil and Gas Journal (Sept. 5, 1960), excess petrochemical plant capacity was expected to develop when announced expansions were completed, particularly for olefin and aromatic production. To prevent this, the largest producers of the materials, the oil companies, were beginning to manufacture inter-

mediates and end products, thus using a large part of the basic materials captively.

More than half of the announced new plants and expansions are in the Gulf Coast area from Brownsville, Tex., to New Orleans and Baton Rouge, La. Leading petrochemical producers in this area justified expansion because of nearby and readily available raw materials from refineries and gasfields; a plentiful supply of low-cost natural gas for fuel; ample supplies of fresh water, sulfur, salt, and lime; and ready access to water transportation for the plant products, either by ocean-going tanker or river barge. Also, many of the plants were dependent on other plants for interchange of raw materials and byproducts.

In Louisiana, chemical construction facilities costing an estimated $155 million were to be installed during 1960–61, as announced by the Manufacturing Chemists' Association (MCA). This included $53 million for 12 projects planned and $102 million for 17 projects

Digitized by Google

underway. Louisiana chemical producers in 1959 completed 16 projects costing nearly $216 million. The Louisiana total chemical construction expenditures for the 3-year period (1959–61) was $371 million—second highest in the United States and 12.4 percent of the national total of $3,002 million. The State total included 45 privately financed projects in 20 communities by 33 companies. MCA reported that Louisiana had received about $726 million in new chemical construction during the past 6 years.

Continental Oil Co. started constructing a plant at Lake Charles, Calcasieu Parish, in March, to manufacture petroleum-derived industrial alcohols from ethylene. Planned capacity was 50 million pounds a year of straight-chain primary alcohols for use in the manufacture of detergents, plastics, cosmetics, and textiles. The plant, scheduled for completion early in 1961, was to cost an estimated $10 million.

Hercules Powder Co., Lake Charles, completed its $16 million plant with capacity to produce more than 100 million pounds of polypropylene a year. Polypropylene is a plastic resin used for manufacturing film, automobile seat covers, webbing, and molded plastic items.

Cities Service Co. announced plans to build a multimillion-dollar petrochemical plant at its Lake Charles petroleum refinery. Annual capacity of the new facility was to be 120 million pounds of orthoxylene. Basic feed stock for the new plant would be supplied by existing units of the refinery.

Columbia-Southern Chemical Corp. completed an ethylene dichloride plant at its Lake Charles facility. The new $1 million plant adjoins the firm's chlorine and caustic soda manufacturing operation.

Petroleum Chemicals, Inc., Lake Charles, expanded its ethylene producing capacity from 200 million to 300 million pounds per year.

American Cyanamid Co., Jefferson Parish, announced further additions to its Fortier plant which will bring the total company investment in the New Orleans area to about $110 million.

Polymer Chemical Division, W. R. Grace & Co., announced plans for a 50-percent increase in capacity at its Baton Rouge plant. At this plant, a producer of high-density polyethylene plastics, the company had just completed additions in December 1959.

Esso Standard, Division of Humble Oil & Refining Co., completed a $16 million production facility for butyl rubber at its Baton Rouge petroleum refinery and chemical plant. First shipments of butyl rubber were made by barge in October. The company also increased its oxo-alcohol capacity at the Baton Rouge refinery to 90 million pounds per year.

General Chemical Division, Allied Chemical Corp., indicated it would enter the fluorocarbon field and construct a plant at Baton Rouge to produce the new group of plastics.

At Plaquemine, Iberville Parish, Dow Chemical Co. made first shipments of polyethylene in December. The plastic producing facilities at the plant were completed in October.

Shell Chemical Co. in Norco was constructing a $14 million addition to its existing petrochemical facilities. Added products were to be synthetic glycerin and acrolein.

Digitized by Google

Crown Zellerbach Corp. was constructing a $1.7 million chemical plant at Bogalusa, Washington Parish, to produce organic sulfur compounds.

At Chalmette, Bay Petroleum Co., wholly owned subsidiary of Tennessee Gas Transmission Co., was constructing a petrochemical plant to produce aromatics for use in manufacturing plastics and chemicals. Completion of the unit was scheduled for mid-1961.

## NONMETALS

**Barite.**—Crude barite, imported from Arkansas, Missouri, and foreign countries, was ground for use in oil well drilling fluids in three plants at New Orleans and one at Lake Charles. Output of ground barite decreased 14 percent and shipments decreased 17 percent from 1959, reflecting less drilling for petroleum and natural gas.

**Cement.**—Portland cement, produced in three plants, was 6 percent below the 1959 output. The decline was mainly attributed to a 13-percent drop in value of construction contracts awarded (table 4) and to fewer highway construction programs.

**Clays.**—There was an overall 17-percent decline in production of miscellaneous clay. Clay used for lightweight aggregate and cement decreased 6 percent and 42 percent, respectively; clay for heavy clay products increased 15 percent. Again, the loss was attributed to less construction during the year. Over 245,000 tons of local clay was used to manufacture heavy clay products at 12 brick plants in 11 parishes. Lightweight aggregate was produced at Alexandria, Rapides Parish; Erwinville, Point Coupee Parish; and north of Shreveport, Caddo Parish.

**TABLE 16.—Destination of shipments of portland cement to Louisiana from mills**

| Year | Louisiana (thousand barrels) | Change, percent | |
|---|---|---|---|
| | | In Louisiana | In United States |
| 1951-55 (average) | 6,108 | | |
| 1956 | 8,507 | +16 | +6 |
| 1957 | 7,585 | −11 | −6 |
| 1958 | 8,048 | +6 | +6 |
| 1959 | 8,908 | +11 | +9 |
| 1960 | 8,007 | −10 | −7 |

**Gypsum.**—Winn Rock, Inc., formerly Anderson & Dunhan, Inc., Winn Parish, mined crude gypsum for a retarder in portland cement. National Gypsum Co. and U.S. Gypsum Co. calcined imported crude gypsum and manufactured plaster, lath, and wallboard.

Bestwall Gypsum Co.'s new $6 million plant in New Orleans was to process about 200,000 tons of imported gypsum a year to produce plaster, lath, and gypsum board. The plant, on the new Mississippi River-Gulf outlet, was completed late in 1960.

**Lime.**—In October, U.S. Gypsum Co. began operating a new lime plant adjacent to its gypsum manufacturing plant, on the Inner Harbor Navigation Canal at New Orleans. The $1.5 million plant produced quicklime and hydrated lime from clam shell dredged from Lake Pontchartrain. A 10- by 250-foot rotary kiln was used to calcine the shell.

Pelican State Lime Corp. began commercial operation in March of a new lime manufacturing plant east of Morgan City, St. Mary Parish. The $1.5 million plant was designed to make 150 to 175 tons daily of quicklime from oyster shell dredged from a State lease in Vermilion Parish.

**Nitrogen Compounds.**—Air Reduction Sales Co. completed its $2 million plant at the old Ronaldson airport near Baton Rouge. The plant had a daily production capacity of 30 tons of liquid oxygen, nitrogen, and argon for industrial uses.

**Salt.**—Output of salt decreased slightly in quantity from 1959, although the value increased over $1 million. A detailed study of 66 salt domes in south Louisiana was published by the New Orleans Geological Society.[5]

Freeport Sulphur Co. purchased rights to produce brine from the salt dome beneath its Grand Isle sulfur mine. The company perfected a process which uses salt water rather than fresh water in the Frasch process of recovering sulfur from underground deposits.

Morton Chemical Co. began constructing a new $3.4 million plant to replace older facilities at Weeks Island. The plant will manufacture sodium sulfate and muriatic (hydrochloric) acid.

**Sand and Gravel.**—Production of over 14 million tons of sand and gravel—10 percent less than in 1959—reflected the decline in construction activity. Washed sand and gravel was 13.3 million tons, or 95 percent of the total. Sand use was as follows: Building sand, 44 percent; paving sand, 43 percent; other construction sand, 8 percent; fill sand, 3 percent; railroad ballast, blast sand, engine sand, and miscellaneous, 2 percent. Gravel use was as follows: Paving gravel, 57 percent; building gravel, 35 percent; other construction gravel, 4 percent; fill gravel, 3 percent; all other uses, 1 percent. There were 69 producers of sand and gravel in 22 parishes.

| 1958 | 14,820 | 18,555 | 254 | 85 | 15,074 | 18,640 |
| 1959 | 12,477 | 14,659 | 102 | 70 | 12,579 | 14,729 |
| 1960 | 14,610 | 16,982 | 451 | 137 | 15,061 | 17,119 |
| 1961 | 15,595 | 19,898 | 547 | 213 | 16,142 | 20,111 |
| 1962 | 13,935 | 18,900 | 384 | 116 | 14,319 | 19,016 |

Owens-Illinois Glass Co., Toledo, Ohio, began constructing a $5 million glass container plant on a 24-acre site on the Inner Harbor Navigation Canal near New Orleans. The plant, scheduled to be completed in July 1961, will require 55,000 tons of raw material to produce 50,000 tons of bottles and jars per year.

**Stone.**—Most of the stone production was shell (clam and oyster). A small amount of miscellaneous stone was produced in Winn Parish. Lacking an adequate supply of stone, Louisiana relies on shell as a substitute. Shell (almost pure calcium carbonate) meets the highway material specifications. Concrete aggregate and road construction used 73 percent of the output; cement, 17 percent; lime, 9 percent; and paint filler, rubber filler, and mineral food, 1 percent.

**Sulfur.**—Shipments of Frasch sulfur reached a new record high in 1960. The revival of sulfur sales to the steel industry (established in 1959) added to the excellent demand established by such large sulfur consuming industries as fertilizers, chemicals, pulp paper, pigments, and rayon. Production of Frasch sulfur, which gained 11 percent over 1959, more than met the demand, and about 500,000 tons of sulfur was stockpiled.

The world's first offshore sulfur mine—in the Gulf of Mexico near Grand Isle—started commercial production on April 14. This $5 million facility had a capacity of 4,500 tons of molten sulfur daily and was connected to storage tanks on Grand Isle by a 3½ mile pipeline.

Freeport Sulfur Co. reported that its new sulfur mine at Lake Pelto was placed in operation late in the year. To mine the deposit, a specially reconditioned its barge-mounted plant, used formerly at the exhausted Bay Ste. Elaine deposit. The Lake Pelto mine is about 40 miles southwest of New Orleans on the marshy coast of the Gulf of Mexico.

## METALS

**Aluminum.**—Kaiser Aluminum & Chemical Corp. produced alumina at its Gramercy and North Baton Rouge plants. Alumina from the two plants was transported downstream to the firm's aluminum works at Chalmette for reduction to primary aluminum. In November, Kaiser announced plans for a $700,000 plant to produce activated alumina in a uniform spherical shape at the Baton Rouge alumina works. Completion was scheduled for the second quarter of 1961. The corporation also announced plans to erect a $1.4 million aluminum fluoride plant at Gramercy. Construction, to start about mid-1961, was to be completed by the third quarter of 1962.

On March 4, the Kaiser aluminum reduction plant at Chalmette returned to full production by reactivating its ninth potline; however, on August 6, one potline was shut down; a second was closed on October 2, and a third on November 13.

Ships carrying bauxite to the adjacent Ormet Corp. alumina plant were unloaded at the Burnside Bulk Marine Terminal, 30 miles south of Baton Rouge on the Mississippi River. The terminal also was used to load barges with alumina for shipment up the Mississippi and Ohio Rivers.

**Iron Ore.**—At the Burnside Marine Terminal, foreign iron ore was transferred from ocean ships to barges for shipment to steel mills in the St. Louis and Chicago areas.

**Nickel-Cobalt.**—The Freeport Nickel Co. nickel-cobalt refinery at Port Nickel was shut down during the year because it could no longer be supplied with nickel-cobalt sulfide concentrate from Cuba—its only source. Moa Bay Mining Co., Freeport Nickel Co. subsidiary and producer of nickel-cobalt sulfide concentrate at its mining and ore-concentrating facilities in Oriente Province, Cuba, was shut down April 1 due to unfavorable tariffs imposed by the Cuban Government.

## REVIEW BY PARISHES

Minerals were produced in all but 2 of the 64 parishes. Mineral fuels were produced in 55 parishes, other minerals in 41 parishes. Five parishes reported mineral production valued at over $100 million (three in 1959): Plaquemines, $391 million; Terrebonne, $193 million; Lafourche, $182 million; St. Mary, $119 million; and Cameron, $109 million. Four parishes reported production valued between $50 and $100 million (six in 1959): Acadia, $90 million; Iberia, $83 million;

Digitized by Google

Vermilion, $77 million; and Jefferson, $65 million. Forty-one other parishes produced minerals valued at over $1 million each.

**Acadia.**—Exploratory drilling of 29 wells for petroleum and natural gas proved 24 percent productive, and of 96 development wells drilled, 66 percent were productive; also, 215 crew-weeks were spent in geophysical prospecting. The parish ranked first in the production of natural gas liquids, output of which was valued at $21.7 million. At Rayne, natural gas liquids were recovered at the No. 12 Toca plant of Texas Natural Gasoline Corp. and by the plant of LaGloria Oil & Gas Co.

**TABLE 22.—Value of mineral production in Louisiana, by parishes[1]**

| Parish | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Acadia | $70,754,658 | $90,319,953 | Petroleum, natural gas, natural gas liquids. |
| Allen | 7,720,339 | 8,845,134 | Do. |
| Ascension | 1,256,907 | 1,748,880 | Petroleum, natural gas, salt. |

**TABLE 22.—Value of mineral production in Louisiana, by parishes[1]—Continued**

| Parish | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| St. Landry | $35,278,059 | $39,464,336 | Petroleum, natural gas, natural gas liquids. |
| St. Martin | 50,311,820 | 46,739,480 | Petroleum, natural gas, salt, natural gas liquids. |
| St. Mary | 102,636,201 | 118,885,616 | Petroleum, natural gas, natural gas liquids, shell. |
| St. Tammany | 605,077 | 2,098,451 | Shell, sand and gravel, natural gas, petroleum, clays. |
| Tangipahoa | 912,823 | 541,346 | Sand and gravel, petroleum, clays. |
| Tensas | 12,231,195 | 14,726,770 | Petroleum, natural gas liquids, natural gas. |
| Terrebonne[3] | 173,903,332 | 192,963,117 | Petroleum, natural gas, natural gas liquids, sulfur. |
| Union | 7,142,198 | 8,786,383 | Natural gas, petroleum. |
| Vermilion | 72,379,849 | 77,477,086 | Natural gas, petroleum, natural gas liquids. |
| Washington | 1,211,186 | 566,872 | Sand and gravel. |
| Webster | 31,598,615 | 32,743,676 | Petroleum, natural gas, natural gas liquids, sand and gravel. |
| West Baton Rouge | 951,669 | 1,069,869 | Petroleum, natural gas. |
| West Carroll | 318,919 | 343,365 | Natural gas. |
| West Feliciana | (2) | (2) | Sand and gravel. |
| Winn | 1,889,327 | 3,190,229 | Petroleum, salt, stone, gypsum, natural gas. |
| Undistributed | [4] 16,246,199 | 64,393,999 | |
| Total | [4] 1,766,269,000 | 1,967,652,000 | |

[1] East Carroll and Vernon Parishes not listed because no production was reported.
[2] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[3] Terrebonne Parish sulfur shipments included with Plaquemines Parish.
[4] Revised figure.

The Runnels Gas Products Co. announced a $7 million expansion of its Tepetate plant. Scheduled to be completed by January 1961, the new facilities were to produce butane, isobutane, propane, and ethane components. At its Rayne processing plant, Union Texas Natural Gas Corp. installed two large absorbing towers. Petroleum and natural gas also were produced in the parish.

**Ascension.**—The Burnside Marine Terminal unloaded bauxite from South America for Ormet Corp. and loaded alumina onto barges for shipment up the Mississippi and Ohio Rivers. The terminal also was used to transfer imported iron ore from ocean ships to barges for shipment to steel mills in the St. Louis and Chicago areas. At Geismar, Wyandotte Chemical Corp. operated its caustic soda and chlorine plant. Part of a $13 million system of plants for processing natural gas from southwest Louisiana was put on stream late in 1960. The recovered raw liquids from these plants were delivered by pipeline to Geismar, where the Riverside fractionating plant (jointly owned by Union Oil Co. of California and the Goliad Corp.) separated these liquids into petrochemical charge stocks—propane, isobutane, normal butane, and natural gasoline.

Esso Standard, Division of Humble Oil & Refining Co., began a sixth storage well to increase underground storage facilities of plant liquids in the Sorrento salt dome formation. When completed in July 1961, the new well will have storage capacity for 350,000 barrels of propane. Total storage capacity at Sorrento will be raised to 1.8 million barrels.

Borden Co. and U.S. Rubber Co. announced plans to erect a $50 million complex of chemical plants to convert hydrocarbons into numerous chemical products. One of these plants, a joint venture known as Monochem, Inc., will use hydrocarbons such as natural gas or low-

Digitized by Google

flash point liquid fuel to produce acetylene and vinyl chloride monomer. The plant, to be completed in 1962, will be located near Geismar.

**Beauregard.**—Exploratory drilling in the parish resulted in discovery of three oilfields—Buckston Marsh, Righthand Creek, and Brushy Creek. Petroleum, natural gas, and sand and gravel were produced; natural gas liquids were recovered at the Shoats Creek plant of Sunray Mid-Continent Oil Co.

**Bossier.**—Sunray Mid-Continent Oil Co. operated its Benton and Sarepta natural gasoline plants. Natural gas, petroleum, natural gas liquids, and sand and gravel, in order of value, were produced.

**Caddo.**—Caddo Parish again ranked first in total number of oil and gas wells drilled—283 wells in 1960, compared with 437 in 1959.

Caddo Light Aggregate Co., Inc., a subsidiary of Bayou State Oil Corp., produced lightweight aggregate at its plant northwest of Shreveport. Clay from a nearby open pit was used as raw material. Crude petroleum, natural gas, natural gas liquids, sand and gravel, and clay, in order of value, were produced.

**Calcasieu.**—Lake Charles Industrial Complex, comprising over a dozen large plants, built to facilitate production and processing of crude petroleum, natural gas, natural gas liquids, cement, sulfur, lime, and salt, was one of the most important in the State. Exploratory drilling in the parish opened two more oilfields—North Hayes and South Bon Air.

Gulf States Utilities Co., West Lake, completed the third unit (162,000-kw. capacity) at its Roy S. Nelson generating station in April.

Continental Oil Co. announced a $2 million construction program to increase processing capacity from 100 million to 150 million cubic feet of natural gas per day at its Lake Charles natural gasoline plant. Completion was scheduled for January 1961. The company also was constructing a $10 million petrochemical plant to manufacture petroleum-derived industrial alcohols formerly produced from natural fats and oils.

Cities Service Co. announced plans to build a multimillion-dollar petrochemical plant on existing property of the Cities Service Refining Corp. plant. Annual capacity of the new facility will be 120 million pounds of ortho-xylene. Existing units of the refinery will supply the basic feed stock for the new plant.

Petroleum Chemicals, Inc., expanded its ethylene producing capacity to 300 million pounds per year.

Hercules Powder Co. completed a $16 million plant having an annual capacity of more than 100 million pounds of polypropylene. Columbia-Southern Chemical Corp. completed an ethylene dichloride plant adjoining its chlorine and caustic soda manufacturing facilities.

**Cameron.**—Cameron Parish ranked fifth in total value of mineral production and first in value of natural gas. Completion of CATC group's $1.3 million adsorption-type gasoline plant at Grand Chenier was reported by Continental Oil Co., operator. The group includes Continental Oil Co., Atlantic Refining Co., Tidewater Oil Co., and Cities Service Co. The plant, with an initial capacity of 175 million cubic feet of gas daily, processed gas from the group's East and

Digitized by Google

West Cameron fields. The Deep Bayou oilfield and Blue Buck Point and Smith Ridge gasfields were discovered.

**Catahoula.**—Petroleum, sand and gravel, and natural gas were produced. Five oilfields were discovered—California Bayou, Wallace Lake, Utility, South Utility, and Boltners Brake.

**Claiborne.**—Petroleum, natural gas, and natural gas liquids were produced. Lick Creek and Oaks oilfields were discovered.

**Concordia.**—Three oilfields, Lower Sunk Lake, Moro, and Whites Bayou, were discovered. Petroleum, natural gas, and natural gas liquids were produced.

**DeSoto.**—Drilling for petroleum and natural gas in DeSoto Parish continued. The total of 124 holes drilled (176 holes in 1959) proved 31 oil wells and 26 gas wells. Test drilling resulted in discovery of the Catuna gasfield and the Brushy Bayou oilfield.

**East Baton Rouge.**—Construction of new facilities and expansion of existing facilities again was reported in the Baton Rouge area which contains one of the State's largest industrial complexes. Kaiser Aluminum & Chemical Corp. processed Jamaican bauxite into alumina at its North Baton Rouge plant. Polymer Chemicals Division, W. R. Grace & Co., announced plans to increase capacity by 50 percent at its Baton Rouge plant which produces high-density polyethylene plastics. Esso Standard, Division of Humble Oil & Refining Co.—operator of the world's largest petroleum refinery—completed its $16 million production facilities for butyl rubber. First shipments of butyl rubber were made in October by barge. The company also increased oxo-alcohol capacity at its Baton Rouge refinery to 90 million pounds a year.

General Chemical Division, Allied Chemical Corp., indicated it would enter the fluorocarbon plastic field and construct a plant at Baton Rouge to produce the new group of plastics. Clay was mined by Acme Brick Co. for manufacture of brick. Ideal Cement Co. produced portland, high-early-strength, and masonry cements from shell which was barged up the Mississippi River. The Sardine Point oilfield was discovered.

**Evangeline.**—Petroleum, natural gas, and sand and gravel were produced. Natural gas liquids were recovered by the Ville Platte plant of Continental Oil Co., and by the Mamou and Pine Prairie plants of Socony Mobil Oil Co. The Fenris oilfield and North Savoy gasfield were discovered.

**Iberia.**—Iberia Parish ranked first in salt production; more than a third of the salt came from three large mines. Petroleum, natural gas, natural gas liquids, clay, and sand and gravel also were produced. The South Lake Sand gasfield was discovered.

**Iberville.**—Petroleum, natural gas, and salt were produced. The West Rosedale gasfield and Bayou Jacob and Pat Bay oilfields were discovered. Dow Chemical Co. made initial shipments of polyethylene in December from newly expanded facilities at Plaquemine. The plastic producing facilities were completed in October.

**Jefferson.**—In April, Freeport Sulphur Co. began producing sulfur from its $30 million Grand Isle mine, seven miles offshore. The deposit, one of the largest known, was discovered by Humble Oil &

Digitized by Google

Refining Co. Freeport Sulphur Co. purchased rights to mine brine from the salt dome under the Grand Isle mine. The company utilized salt water in the Frasch process to mine sulfur. Because the mine was highly automated, water used in the process had to be constant in its mineral and salt content to assure continuous service. Water from the Gulf of Mexico in this area was not suitable. Jefferson Parish, with petroleum output valued at nearly $60 million, ranked fifth. Natural gas, natural gas liquids, and shell also were produced. The Bayou Segnette oilfield was discovered.

Workers at the American Cyanamid Co. Fortier plant ended an 85-day strike on November 21. The company announced plans for a $300,000-expansion program to augment an expansion completed in 1959.

**Lafourche.**—The parish ranked third in total value of minerals produced, second in crude oil produced, and fifth in natural gas output. Exploratory drilling by Sohio Petroleum Co. resulted in the discovery of the Choctaw School gasfield near Thibodaux. Other discoveries were the Point Chicot and Bayou Poignard gasfields. Natural gas liquids were recovered by the Lockport plant of Socony Mobil Oil Co.

Freeport Sulphur Co. used the Frasch process to mine sulfur at its Chacahoula mine.

**La Salle.**—Petroleum, natural gas, and sand and gravel were produced. Exploratory drilling resulted in discovery of the Bayou Castor gasfield and the Searcy oilfield.

**Lincoln.**—Lincoln Parish, with three natural gasoline plants, ranked second in recovery of natural gas liquids; output was valued at nearly $10 million. Natural gas, petroleum, and sand and gravel also were produced. Filtrol Corp. mined bentonite clay to be used for filtering and bleaching.

**Orleans.**—New Orleans Public Service, Inc., continued construction of the 230,000-kw. generating unit at its Michoud Station. The installation, estimated to cost over $24 million, was scheduled for operation in the spring of 1963. Cement, shell, and lime were produced. Most of the barite ground in the State was from imported ores and was processed in Orleans Parish by three companies. Alatex Construction Service, Inc., expanded crude perlite from Western States for use in acoustical plasters and as a concrete aggregate.

In October, U.S. Gypsum Co. completed a $1.5 million lime plant in New Orleans, to manufacture quicklime and hydrated lime. The plant was on the Inner Harbor Industrial Canal adjacent to the company gypsum products plant. Raw material for the plant was shell dredged from Lake Pontchartrain by local firms and barged to the plant.

Bestwall Gypsum Co. built a $6 million gypsum lath and plaster products plant near New Orleans.

Owens-Illinois Glass Co. broke ground July 20 for a new $3 million multifurnace glass container plant on the Inner Harbor Industrial Canal.

**Ouachita.**—Natural gas, sand and gravel, petroleum, and clay, in order of value, were produced during the year.

Digitized by Google

**Plaquemines.**—The total value of mineral production increased from $365 million (revised) in 1959 to $391 million in 1960—highest in the State. The parish ranked first in production of crude petroleum and sulfur and fourth in natural gas production. Geophysical prospecting amounted to 187 crew weeks. The parish ranked second in total number of oil and gas wells drilled—270 wells (223 in 1959). South Adams Bay oilfield was discovered onshore. The parish had vast onshore and offshore reserves of petroleum and natural gas.

Shell Oil Co. announced plans for building a natural gasoline and propane recovery plant at the mouth of the Mississippi River on Southwest Pass. The plant was to utilize a low-temperature refrigeration and absorption process to extract about 725 barrels of natural gasoline and 400 barrels of propane daily, liquids not recovered previously from gas in the firm's South Pass Blocks 24 and 27 oilfields.

One of the biggest sales of producing property in the history of the Louisiana oil and gas industry was completed when Tennessee Gas Transmission Co. paid Pan American Petroleum Co. more than $150 million for 10 leases in the Bastian Bay area of Plaquemines Parish. The properties included 11 producing gas wells and 13 producing oil wells in which Pan American had full working interest, and 1 oil well and 2 gas wells in which Pan American held part interest with other companies.

At yearend, U.S. Oil of Louisiana and Socony Mobil Oil Co. were drilling the deepest test ever attempted. The S-1 Louisiana Land & Exploration Co. well, aimed at 26,000 feet in the Lake Washington field, Plaquemines Parish, was expected to cost $1.75 million.

Timcoat Corp. produced rubberized asphalt mastic for marine pipeline coating.

**Rapides.**—Seven commercial sand and gravel producers operated. Paving gravel was produced by contract for the National Forest Service. Clay was mined for producing lightweight aggregate by Louisiana Lightweight Aggregate Co. and for structural clay products by Acme Brick Co. Crude petroleum and natural gas were produced.

**Red River.**—Petroleum, natural gas, and sand and gravel were produced. Exploratory drilling resulted in discovery of Bayou Pierre gasfield.

**Richland.**—Petroleum, natural gas liquids, and natural gas, in order of value, were produced.

**St. Bernard.**—Natural gas liquids were recovered by two plants. Petroleum and natural gas were produced.

Kaiser Aluminum & Chemical Corp. processed Jamaican bauxite to alumina at its Gramercy plant, then recovered the aluminum at its Chalmette reduction plant. On March 4, the Kaiser Chalmette aluminum works resumed full production by reactivating its ninth potline. Production had been curtailed since November 1959. However, one potline was shut down on August 6, a second on October 2, and a third on November 13.

At Chalmette, Bay Petroleum Co., wholly owned subsidiary of Tennessee Gas Transmission Co., began constructing a petrochemical plant to produce aromatics for use in plastics and chemicals, and as solvents. The unit was expected to be completed about mid-1961.

Digitized by Google

**St. James.**—Kaiser Aluminum & Chemical Corp. produced alumina at Gramercy. Late in the year, the firm announced plans to construct a $1.4 million aluminum fluoride plant at its Gramercy works. Production of natural gas increased and that of petroleum decreased.

**St. John the Baptist.**—Exploratory drilling led to discovery of the Frenier oilfield. Petroleum, natural gas, and shell were produced.

**St. Landry.**—St. Landry Parish ranked fifth in recovery of natural gas liquids; four recovery plants operated. Petroleum and natural gas also were produced. Exploratory drilling led to discovery of the Chataignier oilfield and the Veltin gasfield.

**St. Mary.**—St. Mary Parish ranked fourth in total value of minerals and in petroleum production, and also produced appreciable quantities of natural gas, natural gas liquids, and shell.

The Central Louisiana Electric Cooperative (CLECO) gasoline plant near Jeanerette extracted natural gasoline, butane, and propane from natural gas. Geophysical prospecting totaled 184 crew weeks during the year. The Eugene Island Block 100 oilfield was discovered offshore.

**Tangipahoa.**—Appreciable quantities of sand and gravel and miscellaneous clay were produced. Discovery of the Wilmer oilfield near Amite by North American Oil Co. of New Jersey, made the parish an oil producer for the first time.

**Tensas.**—Petroleum, natural gas liquids, and natural gas were produced.

**Terrebonne.**—Terrebonne Parish ranked second in total value of minerals produced, second in natural gas production, third in the number of wells drilled for exploration and development of petroleum and natural gas, and third in oil production. Exploratory drilling resulted in discovery of the South Sunrise and South Chauvin gasfields onshore, and Ship Shoal Area Block 169 offshore. Freeport Sulphur Co. began mining sulfur from its new Lake Pelto mine in the fall. The company's unique barge-mounted plant, formerly used at the Bay Ste. Elaine site, was refitted for use at the Lake Pelto mine. Natural gas liquids were recovered by four plants—Shell Oil Co. (two plants), Texaco, Inc., and Tidewater Oil Co.

**Vermilion.**—Vermilion Parish ranked third in value of natural gas and sixth in value of natural gas liquids. Exploratory drilling discovered the Cossinade oilfield and the South Perry, Kaplan, and North White Lake gasfields onshore, and the South Marsh Island Block 23 gasfield offshore. All were gaged as high potential producers of natural gas and petroleum.

Southeast of Abbeville, Phillips Petroleum Co. put into operation a joint-interest Vermilion natural gasoline plant to process nearly 45 million cubic feet of natural gas per day from the North Erath field. Plant products consisted of propane, butane, LP gas mixtures, and natural gasoline. At Cow Island, Union Oil Co. of California and the Goliad Corp. installed part of a $13 million system of plants and pipeline. At the Union Oil Co. plant, raw natural gas liquids

Digitized by Google

were extracted from natural gas and delivered by pipeline across the Atchafalaya Basin barrier to a terminal and processing plant at Geismar in Ascension Parish.

**Webster.**—Webster Parish ranked third in the value of natural gas liquids recovered. Petroleum, natural gas, and sand and gravel also were produced.

**Winn.**—Exploratory drilling resulted in the discovery of the Salt oilfield. Petroleum, salt, stone, gypsum, and natural gas, in order of value, were produced.

# The Mineral Industry of Maine

**This chapter has been prepared under a cooperative agreement for the collection of mineral data between the Bureau of Mines, U.S. Department of the Interior, and the Geological Survey of Maine.**

By Robert W. Metcalf [1] and Mary E. Otte [2]

THE VALUE of mineral production in Maine set a new record in 1960—$13.6 million, 3 percent above 1959. The output of clays, sand and gravel, stone, masonry cement, and mica was greater than in 1959. Greater roadbuilding activity was the principal factor for a record tonnage of sand and gravel. However, feldspar and portland cement output declined.

Maine's mineral resources were being intensively studied by Federal, State, and private agencies. Field and airborne surveys were continuing for metals and nonmetals. About $500,000 was spent in 1960 by mining companies, and Federal and State agencies in exploration surveys for nickel, copper, asbestos, diatomaceous earth, slate, columbite, beryl, and magnetic anomalies.[3] Possible asbestos deposits were explored by diamond drilling in greenstone rock in northwestern Maine.

The Maine Geological Survey had 12 field mapping parties throughout the State and during 1960 completed a geological-geophysical-geochemical study of a Penobscot County zone of magnetic anomalies, the results of which were to be published in 1961. Gravity studies in northwestern Maine and geochemical field research were undertaken by the Federal Geological Survey, and an extensive study of pegmatitic beryl was initiated by the Federal Bureau of Mines.

Two publications treating Maine minerals and mineral locations were issued during the year.[4] Both of these releases listed mineral occurrences; the second gave detailed directions on how to reach the locations.

**Legislative and Government Programs.**—Beryl and mica were purchased for the strategic minerals stockpile through the General Services Administration (GSA) purchase depots at Franklin, N.H. (beryl and mica), and Spruce, N.C. (mica).

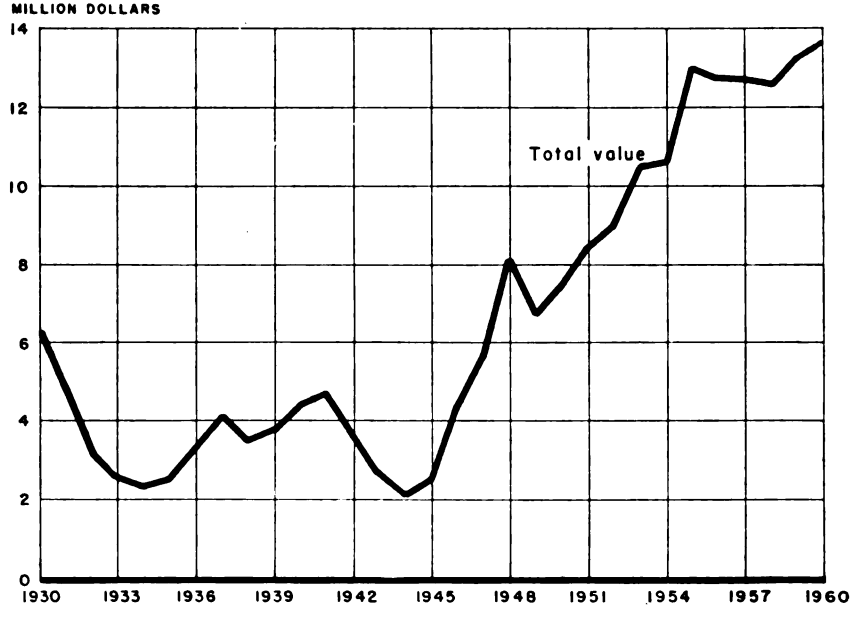

FIGURE 1.—Total value of mineral production in Maine, 1930–60.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Cement.**—Because of lower demand, production of portland cement decreased 16 percent; however, the average value per barrel remained

Digitized by Google

about the same. Dragon Cement Co., a division of American-Marietta Co., at Thomaston, Knox County, was the only cement-producing plant in Maine. A 4-percent wage increase took effect May 1. General use, moderate-heat, and high-early-strength cements were produced at its 2,050,000-barrel wet-process plant. Masonry cement showed a moderate gain in output over 1959. The New England States, primarily Maine and Massachusetts, consumed most of the portland cement and all of the masonry cement produced. A small quantity of portland cement was exported. Most of the portland cement was shipped in bulk in railroad cars and trucks. Portland cement consumers by classification according to use, in order of total consumption of cement, were: Ready-mix concrete companies, building-material dealers, and concrete-product manufacturers.

**Clays.**—Production of clays rose to over 41,000 short tons valued at nearly $50,000; tonnage increased nearly two-thirds and value almost doubled. New and improved machinery, including new kilns, and an active demand for housing contributed to the augmented clay output. Common or miscellaneous clay was used in making building brick. Eight clay mines were supplying adjacent brick-manufacturing plants, two in Androscoggin County, four in Cumberland County, and one each in Franklin and York Counties. The principal producers were Morin Brick Co., Androscoggin County, and LaChance Brothers Brick Co., Cumberland County.

Tests on clays from the Farmington (Franklin County) area and from localities in southwestern Maine indicated their suitability for commercial lightweight aggregate.[5] Physical, chemical, and thermal tests were made on about 100 samples.

**Feldspar.**—Output of crude feldspar dropped 14 percent to the lowest point since 1944. Foreign china imports, lower ceramic activity, and increased competition from other ceramic raw materials were contributing factors. Average value per ton also decreased to $6.09 from $6.31 in 1959. Over 90 percent of the feldspar sold was mined in Oxford County, and the balance was mined in Sagadahoc County. Producers' reports and purchases by feldspar grinders indicated output by six producers at nine mines in Oxford County and five mines in Sagadahoc.

Two companies crushed or ground feldspar, one at Topsham, Sagadahoc County, and the other at West Paris, Oxford County. The plant at Topsham crushed feldspar for poultry grit for use in Maine. The Oxford mill ground feldspar largely for ceramic purposes, although a sizable quantity was consumed for soaps and abrasives. Ceramic uses included electrical porcelain, tile, sanitary ware, and other pottery products. Sales of ground feldspar declined sharply; shipments were mostly to North Central and Eastern States.

**Gem Stones.**—Oxford County continued to be the chief area for collecting gem-quality stones and mineral specimens in Maine. Smaller quantities of material were found in several other counties, including Androscoggin, Cumberland, Hancock, Kennebec, Sagadahoc, Wash-

[5] Caldwell, D. W., Glacial Lake and Glacial Marine Clays of the Farmington Area, Maine. Origin and Possible use as Lightweight Aggregates: Maine Geol. Survey, Spec. Geol. Studies Ser. No. 3, Augusta, Maine, 1959, 48 pp. (Abstract in Rock Products, vol. 63, No. 3, March 1960, p. 67).

Digitized by Google

ington, and York. Included in the gem materials found in recent years were garnet (Androscoggin County); diopside, epidote, vesuvianite, and smoky quartz (Cumberland County); chalcopyrite and molybdenum (Hancock County); nephelite, sodalite, and zircon (Kennebec County); agate, amethyst, beryl, jasper, mica, rose quartz, the lithium minerals—amblygonite, lepidolite, and spodumene—and torbernite (Oxford County); beryl, mica, tourmaline (Sagadahoc County); galena (Washington County); and garnet, scheelite, and molybdenum (York County).

**Mica.**—Production of sheet mica increased 20 percent and scrap mica 9 percent. Sheet mica output was stimulated by larger Government buying for the strategic stockpile, and reached nearly 27,000 pounds in 1960. Virtually all the sheet mica came from Oxford County and was sold to the GSA purchase depots at Franklin, N.H., Spruce Pine, N.C., and Custer, S. Dak., as hand-cobbed or full-trim material. Sagadahoc County furnished a small quantity. Some punch and other mica was sold to industry. Mica grinders purchased limited quantities of scrap. Thirty-three individuals or firms reported sales to GSA from 14 mines; other quantities came from unidentified locations.

**Nitrogen Compounds.**—Anhydrous ammonia was manufactured at Searsport, Waldo County, for use as a fertilizer component.

**Peat.**—No production of moss peat was reported in 1960. Output in recent years came from Hancock and Washington Counties and was used chiefly as soil conditioner.

**Sand and Gravel.**—Sand and gravel production broke all records, rising to 9.8 million tons, 4 percent higher than in the previous record year, 1959. The chief factors in this increase were the active Federal, State, and local highway building and improvement programs. Cumberland County was the largest producing county (1.6 million short tons), followed in order by Penobscot, Kennebec, Aroostook, and Androscoggin. Washed, screened, or otherwise prepared material comprised 64 percent of the commercial sand and gravel and 30 percent of the Government-and-contractor tonnage.

Government-and-contractor output totaled 80 percent of the total sand and gravel compared with 84 percent in 1959. The Maine Highway Commission was by far the largest producer in the State, producing mostly for road construction and maintenance.

**Stone.**—An expanded roadbuilding program and greater demand for higher valued granite dimension stone combined to raise the total tonnage and value of stone marketed in 1960 by 24 percent in quantity and 39 percent in value. Output of limestone and sandstone also increased substantially, but basalt and slate tonnage declined. Seventeen commercial quarries operated in nine counties: Eight for granite in five counties; five for limestone in three counties; two for quartzite in two counties; and one each for basalt and slate in two counties. Three types of stone were quarried in one county (Kennebec) and two in another (Knox). Three granite quarries produced both crushed and broken and dimension stone; four produced only dimension stone; and one only crushed and broken stone.

Digitized by Google

TABLE 2.—Sand and gravel sold or used by producers, by classes of operations and uses

| Class of operation and use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Commercial operations: | | | | |
| Sand: | | | | |
| Structural | 242,724 | $239,117 | 186,217 | $127,989 |
| Paving | 164,958 | 110,442 | 238,021 | 204,262 |
| Engine | 3,191 | 4,628 | 2,989 | 3,736 |
| Fill | 96,644 | 31,404 | 117,577 | 34,929 |
| Other | 17,996 | 8,218 | 33,232 | 11,341 |
| Gravel, construction: | | | | |
| Structural | 175,722 | 213,121 | 231,711 | 287,796 |
| Paving | 563,029 | 333,898 | 793,014 | 366,559 |
| Railroad ballast | 19,815 | 6,935 | 27,993 | 8,267 |
| Fill | 234,603 | 105,334 | 228,104 | 80,226 |
| Other | 11,081 | 5,162 | 31,146 | 14,274 |
| Gravel, miscellaneous | | | 78,486 | 41,389 |
| Total | 1,531,763 | 1,058,259 | 1,968,490 | 1,180,768 |
| Government-and-contractor operations: | | | | |
| Sand: | | | | |
| Structural | 2,915 | 1,020 | | |
| Paving | 510,092 | 197,418 | 522,308 | 201,634 |
| Other | 12,960 | 4,536 | 3,038 | 1,113 |
| Gravel: | | | | |
| Structural | 455 | 159 | | |
| Paving | 7,391,954 | 2,381,860 | 7,334,362 | 2,505,383 |
| Fill | | | 5,260 | 2,705 |
| Other | 2,279 | 798 | | |
| Total | 7,920,655 | 2,585,791 | 7,864,968 | 2,710,835 |
| Grand total | 9,452,418 | 3,644,050 | 9,833,458 | 3,891,603 |

Dimension stone quarried consisted of slate and granite. Dimension slate was marketed largely as flagging and electrical slate. Dimension granite included rough and dressed monumental stone, rough and dressed construction and architectural stone, rubble, curbing and flagstone, and paving blocks. Crushed and broken granite was used mostly as riprap and roadmaking material, and crushed quartzite and basalt chiefly as roadstone. Crushed and broken limestone was consumed for a variety of uses, but principally in making cement, as road base material, in paper manufacture, and as agricultural limestone. The chief stone-producing counties, in order of quantity, were Knox, Kennebec, and Cumberland, and in order of value, Knox, Hancock, and York.

## METALS

**Beryllium.**—Beryllium sales were reported by two mines in Oxford County and one mine in Sagadahoc County, with additional small quantities reported from unspecified counties. All sales were through the GSA purchase depot at Franklin, N.H., for the strategic materials stockpile. The beryl averaged about 12 percent beryllium oxide.

**Nickel.**—A firm which had been exploring nickel prospects in Knox County for nearly 4 years continued its detailed drilling program.

## REVIEW BY COUNTIES

Paving sand and gravel was produced by the Maine State Highway Commission in each county, both with its own crews and under

Digitized by Google

contract. Small quantities of building sand and gravel also were mined. In addition, Acadia National Park in Hancock, five towns or municipalities in Androscoggin County, two in Hancock County, and one in Penobscot County mined sand and gravel for local road and street maintenance. Acadia National Park in Hancock County contracted for production of miscellaneous stone. The Maine State Highway Commission also contracted for a small quantity of quartzite for road construction in Kennebec and Penobscot Counties.

**TABLE 3.—Value of mineral production in Maine, by counties**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Androscoggin | (1) | (1) | Sand and gravel, clays, gem stones. |
| Aroostook | $405,685 | (1) | Sand and gravel, stone. |
| Cumberland | 1,061,125 | $1,107,479 | Sand and gravel, stone, clays, gem stones. |
| Franklin | (1) | (1) | Sand and gravel, clays. |
| Hancock | (1) | (1) | Stone, sand and gravel, gem stones. |
| Kennebec | 424,625 | 827,431 | Sand and gravel, stone. |
| Knox | (1) | (1) | Cement, stone, sand and gravel. |
| Lincoln | 70,812 | 73,570 | Sand and gravel. |
| Oxford | (1) | (1) | Mica, sand and gravel, feldspar, gem stones, beryllium concentrates. |
| Penobscot | 523,114 | 840,993 | Sand and gravel, stone. |
| Piscataquis | (1) | (1) | Stone, sand and gravel. |
| Sagadahoc | 76,373 | 59,239 | Sand and gravel, feldspar, gem stones, mica, beryllium concentrates. |
| Somerset | (1) | 121,323 | Sand and gravel. |
| Waldo | (1) | (1) | Stone, sand and gravel. |
| Washington | (1) | (1) | Sand and gravel, stone, gem stones. |
| York | (1) | (1) | Stone, sand and gravel, clays, gem stones. |
| Undistributed [2] | 10,716,690 | 10,618,710 | |
| Total | 13,278,000 | 13,648,000 | |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[2] Includes value of sand and gravel (1960), mica, gem stones (1959), and beryllium concentrates (1960) that cannot be assigned to specific counties; and values indicated by footnote 1.

**Androscoggin.**—Ten commercial sand and gravel producers were active, chiefly near Lewiston, Auburn, Leeds Junction, and Lisbon. Most of the sand and gravel was prepared for building and paving material and fill sand. Some bankrun sand and gravel for paving and fill, and miscellaneous gravel also was produced.

Two companies produced miscellaneous clay from open pits near Auburn for manufacturing building brick.

Quantities of gem material collected included beryl, mica, and perthite.

Gypsum products were manufactured at Lisbon Falls by United States Gypsum Co.

**Aroostook.**—Four producers mined sand and gravel commercially, two near Houlton and one each near Presque Isle and Hodgdon. Gravel was produced chiefly for building, paving, fill, and miscellaneous uses. Some building and paving sand also was produced.

Crushed limestone for use as concrete aggregate and roadstone was quarried near Houlton by Lawrence Burleigh and sold to local government agencies.

**Cumberland.**—Commercial sand and gravel was produced by nine companies from pits principally near Cumberland, Portland, and Scarborough. Most of the output was prepared building, paving, and fill sand and gravel, and some bankrun sand and gravel was produced for

Digitized by Google

fill. Leading producers were: Cumberland Sand & Gravel Co. (Cumberland), P. E. Hamlin (Portland), and Leroy S. Prout Sand & Gravel (Scarborough).

Quartzite, for concrete aggregate, roadstone, and riprap, was quarried at the Blue Rock quarry, Westbrook. The stone was blasted from the open quarry, hauled by truck to the local crusher, and stockpiled in various sizes to be used as needed.

Four companies mined miscellaneous clay from open pits near Gray, Gorham, North Yarmouth, and Cumberland for use in making building brick. Royal River Brick Co., Inc., Cumberland Center, installed new brick-manufacturing machinery. The LaChance Brothers Brick Co. installed a new tunnel kiln and dryer, which will make possible year-round brick manufacture, instead of the open-air intermittent brickmaking generally prevalent in Maine. Capacity of the new plant was 7 million brick per year. Clay reserves were said to be sufficient to last for 40 years at the 1960 rate of operation.[6]

Small quantities of smoky quartz and contact metamorphic minerals, such as diopside, epidote, and vesuvianite crystals, were collected as mineral specimens near West Casco and Topsham.

A major center for the production of radar antennas and complex products in space technology and the sonar and nuclear fields was planned for South Portland by Portland Industries Corp. Conversion of a large existing facility containing over 500 machine tools and 500,000 square feet of manufacturing area was projected.[7]

**Franklin.**—Three companies, two near Weld and one near Wilton, produced building and paving sand and gravel.

Miscellaneous clay for manufacturing building brick was produced near West Farmington.

**Hancock.**—Hancock County again led in granite production, with tonnage and value increasing 13 and 10 percent, respectively. Dimension granite was quarried by three companies near Hall Quarry and Stonington, chiefly for use as dressed construction and rough and dressed architectural and monumental stone.

Output of four commercial sand and gravel producers consisted mostly of paving gravel from pits near Blue Hill, Winter Harbor, Hancock, and Gouldsboro.

Pyrite, chalcopyrite, and molybdenum for mineral specimens were collected in the county.

The Penobscot Mining Co. revived activity in copper exploration at its Cape Rosier property and planned a major drilling and geological mapping program.

**Kennebec.**—Sand and gravel recovered by four commercial producers near Augusta, Fayette, Gardiner, and Waterville was sold mostly for building and paving sand and gravel, and fill gravel.

Crushed granite for use as road material was quarried near Gardiner and sold to local government agencies. H. E. Sargent produced crushed limestone for road material at a semiportable plant near Vassalboro for the Maine State Highway Commission.

[6] The New Englander, May 1960, p. 35.
[7] American Metal Market, vol. 67, No. 145, July 29, 1960, p. 12.

Digitized by Google

**Knox.**—Dragon Cement Co., a division of American-Marietta Co., utilized captive cement rock at its two-kiln plant at Thomaston to manufacture cement. Mostly general-use and moderate-heat cement and some high-early-strength portland cement was manufactured by the wet process. Mortar cement also was produced. Shipments of cement were mostly in bulk by railroad to ready-mix concrete companies and building-material dealers.

Knox County again led in quantity and value of stone produced, with a slight increase in 1960. Dimension granite was quarried by Hocking Granite Industries, Inc., Clark Island, mainly for dressed architectural, construction, and curbing stone. Some crushed stone for use as riprap also was produced. Limestone, crushed principally for road material, riprap, and for use in paper manufacture, was produced by the Rockland-Rockport Lime Co. quarry at Rockland, and the Lime Products Corp. quarries at Union and Warren.

A commercial producer near Warren sold processed sand and gravel for building and paving material, and bankrun gravel for fill. Some of the material was sold to local government agencies.

Roland F. Beers, Inc., continued its 4-year development and exploration program for nickel in Union. Milling tests had been run, both by the Federal Bureau of Mines and by private testing laboratories, to determine economic methods of primary concentration. The company expected to continue its detailed drilling program during the fiscal year 1960–61.

**Lincoln.**—Commercial gravel for structural work and bankrun gravel for fill were produced by Howard R. Wright near Newcastle.

**Oxford.**—Most of the sheet mica mined in Oxford County was sold through the GSA (Franklin, N.H.) purchase depot; some was sold through the Custer (S. Dak.) and Spruce Pine (N.C.) depots. Some hand-cobbed mica was sold to industry. Sales of sheet mica increased 23 percent in quantity and 16 percent in value. A small quantity of scrap also was sold by three producers to private industry. Thirty-two producers worked 13 mines at various localities in the county. Leading mica-producing mines operated included the Wardwell (Albany), Wheeler (Gilead), Pelletier and Cliff (both at Norway), Tyler and Rich (Mason), and the George Elliott (Rumford).

Six producers mined feldspar from open pits near West Paris, West Sumner, Hebron, and Norway. Bell Minerals Co., the leading producer, ground feldspar for ceramic uses, including pottery, and electrical procelain, tile, and sanitary ware, and for soaps and abrasives and metal polish. Major shipments were to Pennsylvania, Wisconsin, and New York; smaller quantities went to other States. The Bell Minerals Co. continued to explore new areas and to obtain more complete data on known or partially proven areas.[8]

Beryllium concentrate (beryl) production and value in the county increased slightly, although only two mines were operated compared with four in 1959. Stanley Pechnik worked the Pelletier mine (North Norway) and Lester E. Wiley the Wardwell mine (Albany). Sales were to the GSA (Franklin, N.H.) purchase depot.

[8] Brick & Clay Record, vol. 137, No. 2, August 1960, p. 87.

Digitized by Google

Oxford County remained the principal source of gem material. Rose quartz, jasper, beryl, and aquamarine specimens were collected near Swift River, Albany, and Waterford by individual collectors as a hobby, and by dealers for resale or jewelry manufacture.

Unscreened structural sand and gravel and paving and ice-control sand were recovered from pits near Rumford, Mexico, and Norway.

**Penobscot.**—Penobscot County ranked first in production of sand and gravel, with an increase of 13 percent in tonnage and 34 percent in value. Eight commercial producers operated, compared with five in 1959. Mostly building, paving, and fill sand and gravel was produced. Eighty-nine percent of the material was screened, and the entire production was transported by truck. Pits were operated chiefly near Stillwater, Lincoln, and Milford.

Bridge Construction Corp. produced crushed quartzite near Orono. Most of the stone was used as road material for local government projects.

**Piscataquis.**—Portland-Monson Slate Co. produced electrical and flagging slate at its Nos. 2 and 4 underground mines at Monson, and processed the slate at a local finishing mill. Lack of demand by industry for heavy switchgear panels resulted in slight decreases in quantity and value of output. Some flagstone and electrical slate was exported to Canada.

**Sagadahoc.**—Tonnage and value of feldspar decreased considerably, with only 5 operators compared with 12 in 1959. Some of the feldspar was purchased, crushed, and screened by Topsham Feldspar Co. at its Topsham mill solely for use as poultry grit. Consolidated Feldspar Department, International Minerals & Chemical Corp., did not operate its Topsham mill.

Earl Williams and Willard Titcomb sold full-trim mica from the Trott Cove mine near Woolwich to the GSA (Franklin, N.H.) purchase depot. Punch and other mica from the same mine was sold to industry.

Mrs. Francis MacDonald mined a quantity of beryllium concentrate (beryl) at various quarries near Georgetown and sold it to the GSA (Franklin, N.H.) purchase depot.

Perthite, quartz, mica, beryl, and tourmaline mineral specimens and semiprecious gem material were collected in the county.

Building and paving sand and gravel was recovered from pits near Bath and Topsham.

**Somerset.**—R. F. Beers. Co. (Troy, N.Y.) undertook geophysical and geological surveys for nickel near a sulfide-bearing gabbro body south of Moosehead Lake, and Scott Paper Co. continued diamond drilling for copper mineralization in the northern part of the county.

**Waldo.**—Dressed architectural and curbing dimension granite was quarried by Grenci & Ellis, Inc. at its Mount Waldo quarry near Frankfort.

Anhydrous ammonia was manufactured at Searsport by Northern Chemical Industries.

**Washington.**—Building, paving, and fill sand and gravel, and bank-run gravel for use as railroad ballast were recovered from pits by four commercial producers near Cutler, Machias, and East Machias.

Digitized by Google

Crushed basalt for use as concrete aggregate, roadstone, and screenings was produced by A. P. Wyman, Inc., Cutler.

Small quantities of galena and meta-rhyolite for mineral specimens were found near West Lubec.

**York.**—The John Swenson Granite Co., Inc., quarried dimension granite for dressed architectural stone, and some crushed granite for riprap from the Swenson Green quarry near York and the Swenson Pink quarry near Highpine.

Building and paving sand and gravel, and gravel for fill were recovered near Biddeford, Sanford, and York.

Miscellaneous clay for making building brick was mined near Eliot.

Scheelite, molybdenum, and garnet mineral specimens were collected in the county.

Digitized by Google

# The Mineral Industry of Maryland

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Maryland Department of Geology, Mines, and Water Resources.**

By James R. Kerr [1] and Mary E. Otte [2]

THE VALUE of mineral production in Maryland increased over $2.3 million in 1960 to a record high of $55.5 million. Greater output of sand and gravel, crushed stone, and cement offset smaller output of coal, natural gas, and clays. In terms of value, cement was the leading commodity, followed by stone and sand and gravel.

Baltimore County led in value of mineral production, followed by Carroll and Washington Counties.

**TABLE 1.—Mineral production in Maryland [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays [2] thousand short tons | 661 | $944 | 612 | $853 |
| Coal do | 842 | 3,188 | 748 | 2,799 |
| Gem stones | (3) | 2 | (3) | 2 |
| Natural gas million cubic feet | 4,373 | 1,181 | 4,065 | 1,081 |
| Sand and gravel thousand short tons | 10,034 | 12,983 | 10,076 | 13,221 |
| Stone do | 7,445 | 15,476 | 7,944 | 16,962 |
| Value of items that cannot be disclosed: Ball clay, cement (masonry and portland), lime, greensand marl, potassium salts, talc and soapstone | ---------- | 21,416 | ---------- | 22,779 |
| Total Maryland [4] | ---------- | 53,189 | ---------- | 55,527 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producer).
[2] Excludes ball clay; included with "Value of items that cannot be disclosed."
[3] Weight not recorded.
[4] Total adjusted to eliminate duplicating value of clays and stone used in manufacturing cement and lime.
[5] Revised figure.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Cement.**—Shipment of portland and masonry cement from plants in Maryland continued to increase, rising 7 percent over 1959. Produc-

[1] Commodity-industry analyst, Bureau of Mines, Pittsburgh, Pa.
[2] Statistical clerk, Bureau of Mines, Pittsburgh, Pa.

Digitized by Google

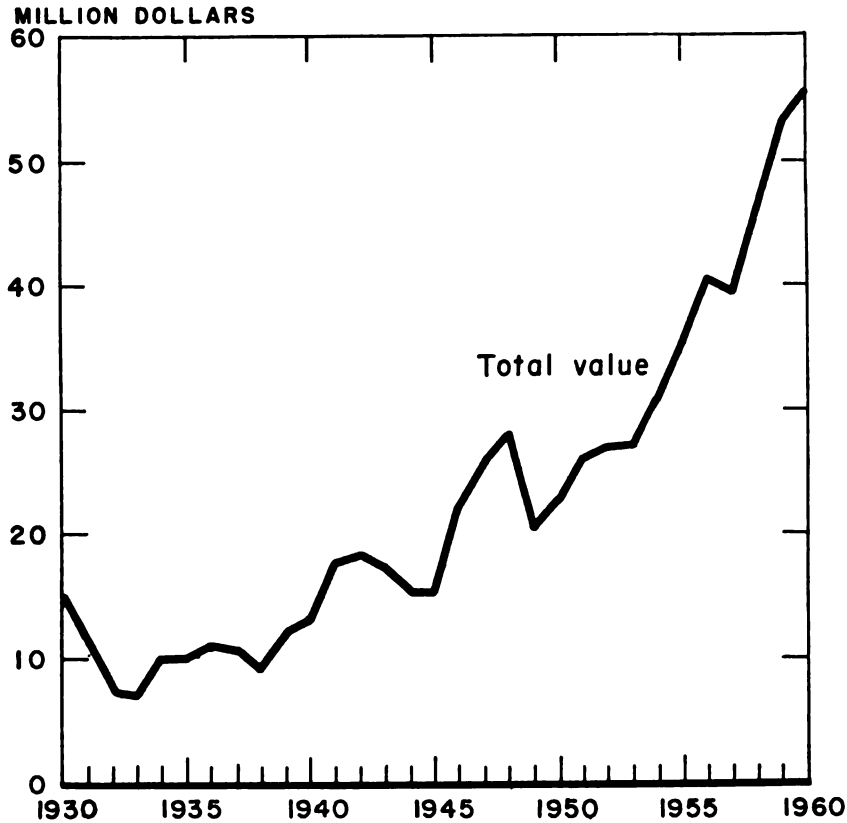

FIGURE 1.—Value of mineral production in Maryland, 1930–60.

tion of portland cement was at 77 percent of capacity, compared with 75 percent in 1959 and 60 percent in 1958. Most of the production was non-air-entrained, general-use, and moderate-heat types. Both wet and dry process plants operated, but most of the output was by the dry process. Power was both purchased and generated by the cement companies, but the larger quantity was purchased from local utility companies.

Most of the mineral output was used in Maryland, but substantial shipments were made to Virginia, Pennsylvania, and the District of Columbia. Much of the portland cement was used in ready-mixed concrete, concrete products, and highway and other construction. Cement came from Carroll, Frederick, and Washington Counties; Carroll County was the leading producer.

**Clays.**—Production of clays decreased 7 percent in tonnage and 10 percent in value, owing to decreased demand for refractory materials and heavy clay products. The output was mostly miscellaneous clay for use by the construction industry, either as building brick or as a raw material for cement. The production of miscellaneous clay decreased 3 percent and fire clay production decreased 55 percent. Al-

Digitized by Google

though reduced output of ball clay was reported, the uses remained unchanged; floor and wall tile, pottery, and refractories consumed most of the output.

Clay output came mostly from 14 captive mines. However, four mines produced clay for sale on the open market. Clay was produced in 10 counties. Baltimore County was the only source of ball clay. Allegany was the leading of four fire clay-producing counties, and Baltimore was the leading of eight miscellaneous clay-producing counties, followed by Prince Georges and Washington Counties. The output came from open pit mines except for two underground mines in Allegany County.

Widespread deposits of clay in southern Maryland that may be suitable for manufacturing lightweight aggregate of superior quality were discovered by Federal and State agencies. The St. Marys formation in southeastern Calvert and St. Marys Counties yielded clays that, when expanded, compared favorably in quality with the better expanded aggregates used in light-weight concrete.[8]

**Gem Stones.**—Williamsite was collected, chiefly by amateur collectors, at scattered localities, mainly in Cecil County.

**Gypsum.**—Imported gypsum was calcined at a plant near Baltimore for producing wallboard and lath and base-coat plasters.

**Lime.**—Output of lime decreased slightly compared with 1959, owing to reduced demand for hydrated agricultural lime. The industry, consisting of 3 producers in Frederick County, operated a total of 34 pot kilns and 2 continuous hydrators using both coke and coal as fuel. Production in 1960 slightly exceeded 60 percent of capacity.

**Marl, Greensand.**—Greensand marl continued to be produced at Dunkirk, Calvert County, from an open pit. After refining, the material was marketed as a soil conditioner.

**Perlite (Expanded).**—Expanded perlite production decreased slightly. Crude perlite from mines in New Mexico, Nevada, Colorado, and Arizona was expanded at plants in Baltimore and near Washington, D.C., chiefly for building plaster and concrete aggregate, and as a filter aid.

**Pigments.**—A wide variety of finished iron oxide pigments was produced at a plant in Prince Georges County. The principal varieties produced were natural red iron oxide, manufactured yellow iron oxide (pure), burnt and raw umber, manufactured magnetic black, Vandyke brown, burnt sienna, manufactured red iron oxide, and venetia red. Zinc chloride and zinc sulfate pigments were produced at Cockeysville and titanium dioxide pigments were produced at a plant near Baltimore.

**Potassium Salts.**—Potassium sulfate continued to be recovered as a byproduct of cement operations in Washington County. Output was at a slightly higher rate than in 1959.

**Sand and Gravel.**—Approximately the same tonnage of sand and gravel was produced as in 1959. A decline of 6 percent in the production of gravel for building and paving was offset by an increase of 9 percent in the output of sand, chiefly for the same purposes. As in past years, the commercial output was mostly for building (49 per-

[8] Rock Products, vol. 63, No. 3, March 1960, p. 22.

Digitized by Google

cent) and paving (40 percent). Other markets for sand were glass, grinding, fire, engine, and miscellaneous uses. Other markets for gravel were railroad ballast, fill, and miscellaneous uses. Government-and-contractor production, which was entirely paving gravel, decreased 33 percent.

Over 86 percent of the commercial production was washed, screened, or otherwise prepared, compared with 82 percent in 1959. The average value of commercial sand and gravel increased $0.02 to $1.31 per ton. All Government-and-contractor production was bank-run. Most of the sand and gravel was transported by truck.

Commercial sand and gravel was produced in 14 counties. Prince Georges County led, followed in decreasing order by Anne Arundel, Baltimore, and Cecil. Noncommercial operations were active in Prince Georges, Talbot, and Wicomico Counties.

**TABLE 2.—Sand and gravel sold or used by producers, by uses**

(Thousand short tons and thousand dollars)

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Sand: | | | | |
| Structural | 2,376 | $3,030 | 2,578 | $3,233 |
| Paving | 1,729 | 2,274 | 1,867 | 2,541 |
| Fill | 11 | 4 | 44 | 16 |
| Gravel: | | | | |
| Structural | 2,199 | 3,703 | 2,136 | 3,484 |
| Paving | 2,042 | 2,718 | 1,979 | 2,798 |
| Fill | 91 | 62 | 31 | 14 |
| Gravel miscellaneous | | | 418 | 247 |
| Undistributed [1] | [2] 1,586 | [2] 1,192 | 1,023 | 888 |
| Total [3] | 10,034 | 12,983 | 10,076 | 13,221 |

[1] Includes glass, grinding and polishing, fire or furnace, engine, and other sands; railroad ballast (1960) and other gravel.
[2] Revised figure.
[3] Includes Government-and-contractor paving sand and gravel.

**Stone.**—Output of stone increased 7 percent. Increased production of basalt, granite, and miscellaneous stone offset decreases in the output of limestone, marble, and sandstone. Production of limestone, the leading stone industry, decreased 9 percent chiefly because of lower demand for limestone as concrete aggregate, riprap, and railroad ballast. A greater quantity of limestone was marketed as agstone. Production of sandstone and marble decreased because of a lower demand for dimension stone and for standstone as refractory stone. Output of basalt doubled, owing to a greater demand for basalt as concrete aggregate. Less dimension granite was produced than in 1959, but the use of crushed granite as concrete aggregate expanded considerably. Larger quantities of miscellaneous stone were produced for rough dimension, rubble, and flagging uses, and for crushing for concrete aggregate, resulting in an overall increase of 65 percent in miscellaneous stone output.

The leading stone producing counties in order of decreasing production were Baltimore, Frederick, Washington, and Carroll. Limestone was produced in six counties, crushed basalt in four counties,

Digitized by Google

miscellaneous stone and sandstone in two counties, and marble and granite in one county.

**Talc and Soapstone.**—Production of crude talc and soapstone increased more than 10 percent. The output was ground and sawed at local plants. Most of the crude material was ground for marketing as asphalt filler, and for use in roofing, foundry facings, rubber, and refractories.

Two quarries, one each in Carroll County and Harford County, and three plants, two in Carroll County and one in Harford County, were active. A small quantity of crude Pennsylvania soapstone was ground, and imported talc was sawed into finished products.

**Vermiculite, Exfoliated.**—Crude vermiculite produced outside the State was exfoliated at a plant in Beaver Heights, Prince Georges County.

## MINERAL FUELS

**Bituminous Coal.**—Production decreased 11 percent from 1959. Chief factors in the decline were significant decreases in strip mining in Allegany County and underground mining in Garrett County. Coal from strip mines comprised 65 percent of total output and was valued at $3.32 per ton compared with $4.54 per ton for coal from underground mines. Average value per ton for total State output dropped $0.04 to $3.74.

Coal mining in Maryland was characterized by small nonmechanized underground mines and small contour strip mines. Of the underground production, 74 percent was cut by 41 cutting machines, 81 percent was power-drilled by 43 hand-held or post-mounted drills, and 37 percent was hand-loaded onto face conveyors. Strip mining equipment included 39 power shovels, 6 dragline excavators, and 41 bulldozers. There was no mechanical cleaning in the State but 36 percent of total output was crushed and sized.

**Coke and Coal Chemicals.**—Bethlehem Steel Corp. produced 2,970,005 tons of coke at its Sparrows Point plant of 760 ovens, an increase of 24 percent over 1959. Associated coproducts yielded were coke breeze, 177,748 tons; coke oven gas, 45,916 million cubic feet; ammonium sulfate 27,489 tons; tar, 38 million gallons; and crude light oil, 14 million gallons. Light oil derivatives included benzene, 9 million gallons; toluene, 2 million gallons; and xylene, 658,083 gallons.

**Natural Gas.**—Production of natural gas decreased 7 percent. Output came from the Mountain Lake Park and Accident fields in Garrett County.

## METALS

**Copper.**—On May 19, 1960, Kennecott Copper Corp. dedicated its $30 million electrolytic copper refinery at Hawkins Point in Anne Arundel County, just south of Baltimore. At midyear the plant was processing approximately 10,000 tons of high-purity copper per month originating from the company's copper mines in Arizona, Nevada, New Mexico, Utah, and Chile. Designed capacity was 16,500 tons per month.[4]

[4] Mining Congress Journal, vol. 46, No. 7, July 1960, p. 81.

615629—61——32

Digitized by Google

**Iron and Steel.**—The annual capacity of the State's steel industry at the beginning of the year was 8,350,960 tons. Blast-furnace capacity was 5,480,000 tons. Bethlehem Steel Co. announced plans to increase capacity to 9 million ingot tons during the next 2 years. Key to the increase was a plan to equip all seven furnaces in the new No. 4 open-hearth shop for the use of oxygen.[5]

**Iron and Steel Scrap.**—The collection of iron and steel scrap for open-hearth and electric steel furnace additions was reported throughout the State but was concentrated in the Baltimore area.

## REVIEW BY COUNTIES

**Allegany.**—Coal production decreased 19 percent, owing to sharply curtailed strip-mining activity. Thrasher Construction & Stripping Co., a producer of large quantities in 1959, operated solely in Garrett County in 1960. C. A. Liller Coal Co. abandoned its mine late in 1959. Although the number of active underground coal mines decreased by five, underground production declined only slightly. Average value per ton for underground output remained at $4.44, but strip-tonnage value increased from $3.39 to $3.50 per ton. Leading underground mines were operated by W. & W. Coal Co. (Bakerstown No. 6) and Gary Coal Co. (Gary). The leading strip operators were Moran Coal Co. (Nos. 24 and 24B), Mack Coal Co. (Stewart and Sherman), and Phoenix Big Vein Coal Co., Inc. (Hoffa No. 5).

**TABLE 3.—Value of mineral production in Maryland, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Allegany | $2,252,752 | $1,912,778 | Coal, sand and gravel, stone, clays. |
| Anne Arundel | (2) | (2) | Sand and gravel, clays. |
| Baltimore | 11,749,123 | 11,278,181 | Stone, sand and gravel, clays. |
| Calvert | (2) | (2) | Greensand marl. |
| Caroline | 101,726 | (2) | Sand and gravel. |
| Carroll | 8,249,300 | (2) | Cement, stone, clays, soapstone. |
| Cecil | 969,331 | 1,537,378 | Stone, sand and gravel, clays, gem stones. |
| Charles | 50,000 | (2) | Sand and gravel. |
| Dorchester | (2) | (2) | Sand and gravel, stone. |
| Frederick | 7,435,241 | 7,905,813 | Cement, stone, lime, clays. |
| Garrett | 3,928,448 | 3,343,982 | Coal, natural gas, stone, sand and gravel. |
| Harford | 1,092,169 | 1,036,017 | Sand and gravel, stone, talc. |
| Howard | ------ | (2) | Stone. |
| Kent | 83,342 | 17,000 | Clays. |
| Montgomery | 92,904 | (2) | Stone. |
| Prince Georges | 5,989,109 | 6,784,477 | Sand and gravel, clays. |
| Queen Annes | 168,364 | 67,000 | Sand and gravel. |
| St. Marys | (2) | (2) | Do. |
| Talbot | (2) | (2) | Do. |
| Washington | (2) | (2) | Cement, stone, clays, potassium salts. |
| Wicomico | (2) | (2) | Sand and gravel, clays. |
| Worcester | 38,323 | (2) | Sand and gravel. |
| Undistributed [3] | 10,989,118 | 21,645,268 | |
| Total [4] | [6] 53,189,000 | 55,527,000 | |

[1] Somerset County is not listed because no production was reported.
[2] Figure withheld to avoid disclosing individual company confidential data.
[3] Includes gem stones not assigned to specific counties and values indicated by footnote 2.
[4] Total adjusted to eliminate duplicating value of clays and stone used in manufacturing cement and lime.

Digitized by Google

Sand and gravel tonnage and value were slightly less than in 1959. The Cumberland Cement & Supply Co. quartzite No. 1 plant near Cumberland produced mainly processed glass, grinding and polishing, and structural sand; its No. 3 plant on a sand-and-gravel island near Cumberland produced washed and screened building and paving sand and gravel.

Limestone for concrete aggregate and roadstone was crushed by Fry Coal & Stone Co., Division of American-Marietta Co., at quarries near Corrigansville, Cumberland, and Flintstone.

Fire clay was produced at underground and open-pit mines by Kaiser Refractories & Chemicals, Division of Kaiser Aluminum Corp., near Frostburg, and by Mt. Savage Refractories at its Mt. Savage strip mine. The clay was used for manufacturing firebrick and block.

**Anne Arundel.**—Tonnage and value of sand and gravel increased 11 percent and 13 percent, respectively; the county ranked second in the State in output. Production by five producers near Hanover, Annapolis, Davidsonville, Baltimore, and Linthicum was chiefly prepared building and paving sand and gravel and fire or furnace sand.

Stoneware clay was mined by Severn Clay Co. at an open pit near Glen Burnie and sold for making floor and wall tile, and sanitary ware.

**Baltimore and Baltimore City.**—Despite a 4-percent decline in value of mineral production, the county again led in production and value of stone and clay.

Harry T. Campbell Sons Corp. quarried limestone near Texas and east of Marriottsville in Baltimore County; it was crushed for a wide variety of uses, chiefly for concrete aggregate and roadstone. The Arundel Corp. crushed limestone for road material at its Greenspring quarry. Miscellaneous stone (serpentine) quarried near Reisterstown was crushed for roadbuilding. Oystershell was crushed near Baltimore for use as poultry grit and lime.

Crushed basalt, chiefly for use as concrete aggregate and roadstone, was quarried by The J. E. Baker Co. at the Blue Mount quarry near Whitehall; The Arundel Corp., Baltimore City; and The Donley Stone Co. near Hyde.

Harry T. Campbell Sons Corp., Butler, quarried dimension granite for irregular-shaped and dressed construction stone, rubble, and flagging. The quarry was sold to C. E. Weaver Stone Co. in July.

C. E. Weaver Stone Co., Butler, quarried dimension quartzite for dressed and sawed architectural stone, irregular-shaped rough construction stone, rubble, and flagging.

Sand and gravel output (third highest in the State) decreased 16 percent in tonnage and 19 percent in value. Seven pits were operated during the year. Output, mainly building and paving sand and gravel, was recovered near Baltimore, Lansdowne, and White Marsh. Eighty-one men working an average of 274 days were employed by the sand and gravel industry.

Total value of clay production decreased 14 percent. The county was the only source of ball clay, which was mined near Baltimore and sold chiefly for manufacturing floor and wall tile. Miscellaneous

Digitized by Google

clay for building brick was recovered by two companies at three open-pit mines near Baltimore. Excelsior Brick Co., Baltimore, ceased operations.

Crude perlite purchased in New Mexico was expanded at a Baltimore plant for use chiefly as an aggregate in building plaster.

Imported gypsum was calcined near Baltimore. In addition, United States Gypsum Co. announced plans to build a gypsum products plant at Baltimore, which would use gypsum from Nova Scotia, to supply the growing Baltimore–Washington marketing area.[6]

**Calvert.**—Kaylorite Corp., Dunkirk, the only greensand marl producer in Maryland, sold refined material for use as a soil conditioner.

**Caroline.**—Structural sand and gravel, sand for fill, and paving gravel were produced by Cook & Son, Greensboro. Most of the material was processed and sold to local government agencies for road construction and maintenance.

**Carroll.**—Carroll County again led in shipments and value of cement. With an overall increase in value of production, the county ranked second in mineral output. Lehigh Portland Cement Co. produced crushed limestone, sandstone, and shale for manufacturing cement at its 3-kiln plant at Union Bridge. General use and moderate heat, and high-early-strength air-entrained and non-air-entrained portland cements and mortar cement were produced by the dry process. Cement was shipped mostly in bulk by truck to ready-mixed concrete companies. Major shipments were intrastate and to Virginia; significant quantities went to the District of Columbia, Pennsylvania, and Delaware.

Teeter Stone, Inc., subsidiary of H. T. Campbell Sons Corp., Medford, quarried and crushed limestone solely for use as concrete aggregate and roadstone.

Soapstone was mined at an open pit near Marriottsville by the Liberty Stone Co. Output which was ground at the local plant and at the company's Sykesville plant, was sold mainly as asphalt filler, and for use in roofing and foundry facings.

**Cecil.**—Crushed granite, chiefly for road construction and riprap, was quarried by Maryland Materials, Inc., near North East. Port Deposit Quarries Co., Inc., Port Deposit, produced dimension granite for irregular-shaped construction stone, rough architectural stone, and riprap. Harbison-Walker Refractories Co. produced and crushed quartzite near North East for manufacturing silica brick. D. M. Stoltzfus & Son produced basalt solely for use in road construction, at the Elk Mills quarry near Elkton, a one-bench quarry with an average face-height of 50 feet.

The tonnage and value of sand and gravel output by seven producers in the county increased 8 percent and 19 percent, respectively. Mostly structural, paving, and fill sand and gravel were recovered from pits near Rising Sun, Perryville, Port Deposit, and North East. Part of the output was sold to local government agencies for road work. Twenty-seven men employed by the sand and gravel industry in the county worked an average of 191 days.

[6] Pit and Quarry, vol. 53, No. 1, July 1960, p. 103.

Digitized by Google

Plastic fire clay and some white clay for making refractory firebrick and block were recovered from two open-pit mines near North East.

A quantity of williamsite was obtained by a gem-stone collector at the Chrome Pits mine.

**Charles.**—Paving sand and structural gravel were recovered at a stationary plant near LaPlata.

**Dorchester.**—Processed building sand and gravel and bank-run fill sand were recovered at a stationary plant near Federalsburg by J. Edwin Rosser, Inc.

Oystershell was crushed for poultry grit and lime by J. M. Clayton at Cambridge.

**Frederick.**—Shipments and value of cement continued to increase. Alpha Portland Cement Co. burned captive cement rock at its Lime Kiln plant for manufacturing cement. Mostly air-entrained and non-air-entrained general use and moderate heat and some high-early-strength portland cement were produced in the company's two 400- by 11.4-foot rotary kilns, by the wet process. Output was consumed mostly intrastate; large shipments went to Virginia, Delaware, and West Virginia.

Limestone and cement rock were quarried and crushed chiefly for concrete aggregate and roadstone and for cement and lime manufacture near Woodsboro, Middletown, Frederick, LeGore, New London, and Lime Kiln. The stone industry in the county employed 69 men who worked an average of 242 days.

Three operators of limekilns near LeGore, Woodsboro, and Middletown produced quicklime and hydrated lime chiefly for agriculture.

Miscellaneous clay for manufacturing building brick was mined at open pits near Buckeystown and Hopeland by Hudson Supply & Equipment Co.

**Garrett.**—Production of bituminous coal decreased 8 percent. Both underground- and strip-mined tonnage were less. There were 3 more strip mines active (21) but the new production did not offset reduced output by the Buffalo Coal Co., the leading producer, and the closing of the George L. Smith Contracting Co. Harvey mine. Other large strip-mine producers were Moran Coal Co. (4 pits), Thrasher Construction & Stripping Co., and the Casey Contracting Co. (3 pits). Two less underground mines (24) were active but the sharply decreased production of the Stanley Coal Co. Offutt mine was the chief factor in decreased underground output. Leading producers were W. & W. Coal Co., Droppleman Brothers Coal Co., and Utility Coals, Inc.

Vetter Bros., Inc., produced and crushed blue limestone at the Fry and Browning quarries 9 miles north of Oakland for use as concrete aggregate and roadstone. The company again had an accident-free record during the year.

Sand for ice control and building was produced at two pits near Oakland.

**Harford.**—Although the same number of sand and gravel producers (11) operated in the county as in 1959, tonnage and value decreased 3 percent and 19 percent, respectively. Eight stationary plants and three portable plants produced mainly building and paving sand and

Digitized by Google

gravel and miscellaneous gravel. Leading producers were Stancill's, Inc., Edgewood, and Maryland Sand & Gravel Co., Aberdeen. Other producing areas were near Abingdon and Webster Village.

Gatch Crushed Stone Co. (formerly Thomas B. Gatch & Sons), Churchville, quarried and crushed basalt for road material. The quarry, consisting of two benches with average height and width of face of 30 feet and 60 feet, respectively, began operating in May. D. M. Stoltzfus & Son, Inc., operated the Grays Run quarry and plant near Aberdeen, producing crushed basalt for road material. The Maryland Green Marble Co. quarried near Cardiff and produced cut and sawed marble for building interiors.

Talc was mined by Harford Talc & Quartz Co., Inc., Dublin, and sold mostly for use in foundry facings.

**Howard.**—The Arundel Corp. produced crushed basalt for concrete aggregate and roadstone at a quarry and crusher near Savage.

**Kent.**—Chestertown Brick Co., Chestertown, mined miscellaneous clay from an open pit for manufacturing firebrick and block.

**Montgomery.**—Albert D. Battista quarried dimension granite for rough and dressed construction and rubble at the Bradley Lane quarry near Rockville. Stoneyhurst Quarries, Bethesda, quarried dimension mica schist for rough building stone, rubble, and some flagging.

**Prince Georges.**—An overall increase in tonnage and value (8 percent and 19 percent, respectively) was attributed to increased demand for building and paving sand and gravel. The county again led the 15 sand and gravel-producing counties in the State. Production was reported from 15 operations—12 stationary, 2 portable, and 1 dredge—mostly from areas near Laurel, Upper Marlboro, and the District of Columbia. Seventy-eight percent of the material sold or used was washed and screened. The sand and gravel industry in the county employed 426 men, working an average of 276 days.

Plastic fire clay for refractories and for use in foundries and steelworks was produced by William L. Allen, Laurel. Miscellaneous clay, mainly for building brick, was recovered from open cuts by West Brothers Brick Co. near Washington, D.C., and The Washington Brick Co., Muirkirk. The latter company put a new tunnel kiln into operation and began using a redesigned hammermill crushing plant.

Mineral Pigments Corp., Muirkirk, sold finished iron oxide pigments, chiefly natural red iron oxide and manufactured yellow iron oxide.

Crude perlite from Colorado, Nevada, New Mexico, and Arizona, was expanded at two plants near Washington, D.C. for use chiefly as an aggregate in building plaster.

**Queen Annes.**—R. B. Baker & Sons, Inc., Queenstown, produced chiefly building and paving sand and gravel.

**St. Marys.**—Sand and gravel for structural and paving uses and gravel for fill and surface treatment were recovered from stationary plants near Hollywood and Leonardtown.

**Washington.**—The value of mineral production decreased slightly; the county dropped from second to third among the mineral-producing counties. Total cement value increased to comprise over 80

Digitized by Google

percent of the total value of minerals produced, whereas tonnage and value of stone decreased 20 percent and 21 percent, respectively.

North American Cement Corp. quarried and crushed limestone at the Security plant near Hagerstown, chiefly for manufacturing cement; some was also used for road material and railroad ballast. Five 125-foot rotary kilns and one 140-foot kiln were used to produce general use and moderate heat, and high-early-strength portland cements and masonry cement by the dry process. Shipments were mostly intrastate and to the District of Columbia, Virginia, and Pennsylvania.

Fry Coal & Stone Co., Division of American-Marietta Co., operated the Williamsport quarry near Pinesburg to produce crushed limestone for road material, dust for coal mines, stone sand, and agstone.

Victor Cushwa & Sons, Inc., Williamsport, recovered miscellaneous clay for manufacturing building brick and cement, and for fertilizer filler.

Potassium salts were obtained as a byproduct of cement clinker at the North American Cement Corp. plant at Security.

**Wicomico.**—Building and paving sand and gravel was recovered at a stationary plant near Hebron and at stationary and portable plants near Salisbury.

Miscellaneous surface clay for manufacturing building brick was mined near Salisbury.

**Worcester.**—George B. Cropper washed building sand at a stationary plant near Ocean City.

# The Mineral Industry of Massachusetts

By Robert W. Metcalf [1] and James R. Kerr [1]

THE VALUE of Massachusetts mineral production broke all records in 1960, rising to $27.6 million, 6 percent higher than in 1959, the previous peak year. Production of lime, sand and gravel, and stone increased appreciably over 1959. Quantity and value of both lime and sand and gravel established new highs. Middlesex County led Massachusetts counties in value of mineral output, with nearly one-third of the total State value, followed by Berkshire, Norfolk, and Essex Counties.

The Yankee Atomic Electric Co. began operating a nuclear power plant at Rowe, Franklin County. This development was of major significance in Massachusetts and neighboring New England States. Ten privately-owned New England utilities joined to sponsor this 136,000-kilowatt operation, built by Westinghouse Electric Corp. at a cost of $50 million (including research and development expenses). The plant is fueled by uranium dioxide, and the core contains about 20 tons of uranium, enough for 18 months' operation before fuel reprocessing. The nuclear fuel reportedly is equivalent to 450,000 tons of coal in a conventional plant.[2]

**TABLE 1.—Mineral production in Massachusetts [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Clays—thousand short tons | 101 | $229 | 83 | $71 |
| Gem stones | (3) | 1 | (3) | 1 |
| Lime—thousand short tons | 144 | 2,289 | 154 | 2,370 |
| Peat—short tons | 773 | (3) | (3) | (3) |
| Sand and gravel—thousand short tons | 13,210 | 11,786 | 14,789 | 13,013 |
| Stone—do | 5,102 | 12,375 | 5,247 | 12,782 |
| Value of items that cannot be disclosed: Mineral fuels and nonmetals | | 6 | | 8 |
| Total Massachusetts [4] | | 25,916 | | 27,588 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Weight not recorded.
[3] Figure withheld to avoid disclosing individual company confidential data.
[4] Total adjusted to eliminate duplicating value of stone.

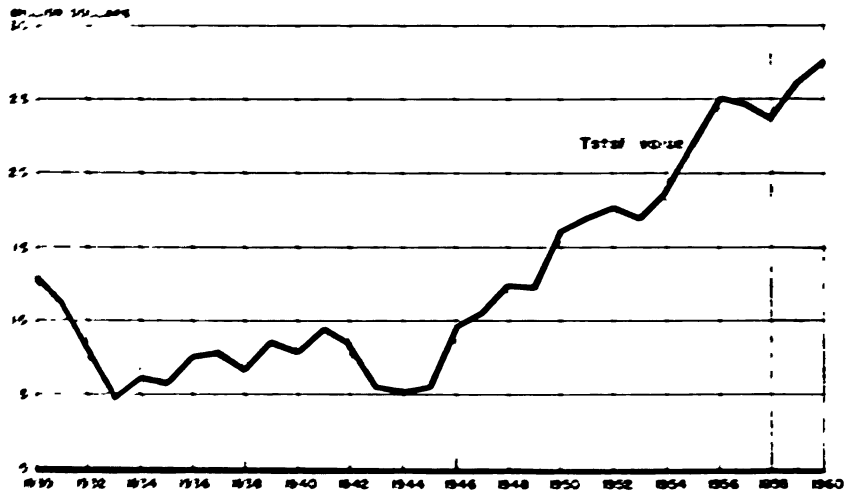

FIGURE 1.—Total value of mineral production in Massachusetts, 1930–60.

## REVIEW BY MINERAL COMMODITIES

### NONMETALS

**Argon.**—Argon was produced by Air Reduction Co., Inc., in connection with nitrogen compounds operations at South Acton, Middlesex County.

**Clays.**—Production of clay totaled 83,000 short tons, 18 percent less than in 1959. Four companies were active at five locations in three counties. The miscellaneous clay was used in making building brick. The principal clay-producing county was Hampden, followed by Plymouth and Bristol.

**Gem Stones.**—Mineral specimens gathered in Massachusetts by collectors included margarite and emery from Hampton County near Chester. Other specimens collected in the State in recent years were epidote, quartz crystal, and magnetite.

**Gypsum.**—Nova Scotia gypsum was made into a variety of products at Charlestown, Suffolk County. The finished products were distributed chiefly to consumers in New England.

**Lime.**—Production of lime totaled 154,000 short tons valued at $2,370,000. These figures are new highs in quantity and value, and represent increases of 7 and 4 percent, respectively, above figures for 1959, the former peak year. The average value per ton dropped 3 percent. Lime was manufactured from both limestone and dolomite. Sizable quantities of quicklime and hydrated lime were consumed in construction and agriculture, although most of the tonnage was used for chemical and industrial purposes. Paper, paints, mason's and finishing lime, and precipitated chalk or whiting were among the principal uses reported. A small quantity of deadburned dolomite was exported to England for use in making acoustic tile. The three active lime companies were all in Berkshire County.

Digitized by Google

TABLE 2.—Lime sold by producers

| Year | Short tons | Value | Year | Short tons | Value |
|---|---|---|---|---|---|
| 1951–55 (average) | 134,724 | $1,950,532 | 1958 | 139,062 | $2,120,677 |
| 1956 | 134,248 | 2,093,195 | 1959 | 143,567 | 2,289,250 |
| 1957 | 137,284 | 2,232,731 | 1960 | 153,710 | 2,370,059 |

**Nitrogen Compounds.**—Nitrogen compounds were produced by Air Reduction Co., Inc., South Acton, Middlesex County.

**Oxygen.**—Oxygen was produced by Air Reduction Co., Inc., in connection with Nitrogen Compounds operations at South Acton, Middlesex County.

**Perlite.**—The Whittemore Co., Roslindale, Suffolk, expanded crude perlite from Colorado, and sold it for use in building plaster and concrete aggregate, and for soil conditioning. Output was less than in 1959. Average market value per unit also declined.

**Roofing Granules.**—Natural and colored granules were produced and sold for use in roofing shingles by a firm at East Walpole, Norfolk County, using miscellaneous stone from Norfolk County as raw material. Output increased 9 percent compared with 1959.

**Sand and Gravel.**—Vigorous building and road construction programs brought a record sand and gravel output in 1960. Production increased 12 percent to nearly 14.8 million tons, and the total value rose 10 percent to $13 million. The average value per ton declined slightly to $0.88, compared with $0.89 in 1959. Total commercial building sand and gravel and commercial paving sand increased, although commercial sales of paving and fill gravel dropped sharply. On the other hand, paving gravel produced and used in Government-and-contractor operations, chiefly by the Massachusetts Department of Public Works, was 3.5 million short tons, more than three and a half times that of 1959. Of the total production, 84 percent was washed, screened, or otherwise prepared. Of the Government-and-contractor tonnage, 89 percent was produced under contract. All of the Government-and-contractor production and a major portion of the commercial output was hauled by truck. A small quantity of the commercial tonnage was shipped by rail.

Middlesex County was first in output of sand and gravel, with 4.3 million tons. Four other counties, Norfolk, Bristol, Worcester, and Hampden, produced over 1 million tons each.

**Stone.**—Production of stone rose 3 percent and consisted of granite, basalt, limestone, sandstone, and miscellaneous stone. Commercial stone comprised 97 percent of the total output and noncommercial or Government-and-contractor made up the balance. Commercial stone was quarried in 12 counties and Government-and-contractor stone (basalt only in 1960) in 4 counties.

Dimension granite, the leading dimension stone, declined 16 percent in quantity compared with 1959, and dimension sandstone was substantially higher than in 1959. The chief uses of dimension granite were for curbing stone, and dressed construction and dressed monumental stone. Other uses included architectural stone, rough construction stone, rubble, and paving blocks.

| Total | 1,741,558 | 710,095 | 3,889,425 | 1,685,286 |
| Grand total | 13,209,870 | 11,786,093 | 14,789,470 | 13,013,353 |

[1] Revised figure.
[2] Included with "Undistributed" to avoid disclosing individual company confidential data.
[3] Includes molding sand, ground sand, and miscellaneous gravel.

Output of crushed and broken stone increased 3 percent, and consisted mostly of basalt, with sizable quantities of granite and limestone, and a smaller tonnage of miscellaneous stone. The chief uses were for concrete aggregate and roadstone. Railroad ballast, agricultural limestone, and riprap were included among the principal uses. The 15-percent rise in output of basalt was noteworthy, reflecting increased road construction in the State.

Commercial stone was quarried by 31 companies at 34 locations in 12 counties, as follows: Basalt, 15 companies at 16 quarries in 9 counties; granite, 12 companies at 12 quarries in 6 counties; limestone, 4 companies at 4 quarries in 1 county; sandstone, 1 company

**TABLE 4.—Stone sold or used by producers, by uses**

| Use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Crushed and broken stone: | | | | |
| Riprap | 114,821 | $147,725 | 77,672 | $55,851 |
| Concrete aggregate and roadstone | 3,730,886 | 6,015,495 | 3,788,199 | 6,144,033 |
| Railroad ballast | 345,239 | 508,913 | 342,197 | 462,162 |
| Agricultural (limestone) | 143,884 | 425,782 | 144,254 | 427,998 |
| Undistributed [1] | 767,553 | 5,277,136 | 895,098 | 5,691,986 |
| Total | 5,102,383 | 12,375,051 | 5,247,420 | 12,782,030 |

[1] Includes dimension stone, furnace flux, and other uses.

Digitized by Google

at 1 quarry; and miscellaneous stone, 1 company at 1 quarry. One company quarried both limestone and basalt, and another, both granite and basalt. Two types of stone were reported from six counties. Quarrying of dimension stone was concentrated in Middlesex County, and most of the crushed and broken stone was produced in Essex, Middlesex, Hampden, Norfolk, and Berkshire Counties.

**Vermiculite.**—Two firms—California Products Corp. and Zonolite Co.—sold exfoliated vermiculite at plants in Norfolk and Middlesex Counties, respectively. Crude vermiculite from foreign countries and domestic sources outside the State was exfoliated and marketed chiefly for use as plaster and concrete aggregate and for insulation.

## MINERAL FUELS

**Coke.**—Operation of the Eastern Gas & Fuel Associates coke oven plant at Everett, Middlesex County, was discontinued in April 1960. After existing stockpiles at Everett are depleted, the company's New Haven, Conn., plant will fill all consumers' requirements.

The closing of the Everett plant was brought about by two chief factors—the gradual replacement over a period of years of coke for household heating by gas and oil and the substitution by gas distributing utilities of natural gas and oil gas for coke oven gas and water gas made from coke.

**Peat.**—One firm in Essex County reported output of peat humus. Sales were greater than in 1959.

## METALS

National Research Corp., Cambridge, began investigating ultrafine metal powder production under a Bureau of Naval Weapons research contract. The higher melting-point metals, such as tantalum, molybdenum, and columbium, were being studied in an effort to produce powders comparable in fineness to those obtainable with lower melting-point metals. The particle size of lower melting-point metals had been reduced to one-millionth of an inch in diameter, by a process discovered about 1958.[3]

**Zirconium.**—The Norton Co., Worcester, which in 1951 developed a fused stabilized zirconia refractory, placed its first commercial installation in a furnace built by C. M. Manufacturing & Machine Co., Bloomfield, N.J. The refractory, used heretofore as a military and industrial research tool, was designed to operate continuously at temperatures near 3,992° F.[4]

## REVIEW BY COUNTIES

The Department of Public Works, Commonwealth of Massachusetts, produced small quantities of crushed and broken basalt as riprap, concrete aggregate and roadstone, and fill in Barnstable, Franklin, Hampden, and Middlesex Counties.

[3] American Metal Market, vol. 67, No. 102, May 27, 1960, p. 10.
[4] Brick and Clay Record, vol. 138, No. 2, February 1961, p. 39.

Digitized by Google

Sand and gravel was produced for the Massachusetts Department of Public Works under contract and by its own crews in the following counties: Barnstable, Berkshire, Bristol, Franklin, Hampden, Hampshire, Middlesex, Nantucket, Norfolk, Plymouth, and Worcester. Three municipalities also reported production of sand and gravel for their own use in street or highway maintenance—North Adams, Berkshire County; Dartmouth, Bristol County; and Lawrence, Essex County.

**TABLE 5.—Value of mineral production in Massachusetts, by counties**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Barnstable | $137,521 | $177,191 | Sand and gravel, stone. |
| Berkshire | 3,919,736 | 4,333,786 | Lime, stone, sand and gravel. |
| Bristol | 1,883,573 | 1,970,787 | Sand and gravel, stone, clays. |
| Dukes | (1) | (1) | Sand and gravel. |
| Essex | 2,687,393 | 2,669,526 | Stone, sand and gravel, peat. |
| Franklin | (1) | (1) | Sand and gravel, stone. |
| Hampden | (1) | (1) | Stone, sand and gravel, clays, gem stones. |
| Hampshire | 644,946 | 439,345 | Sand and gravel, stone. |
| Middlesex | 7,572,861 | 9,156,381 | Stone, sand and gravel. |
| Nantucket | 1,573 | (1) | Sand and gravel. |
| Norfolk | 3,083,685 | 2,902,918 | Sand and gravel, stone. |
| Plymouth | 1,653,162 | 1,287,889 | Sand and gravel, stone, clays. |
| Suffolk | 551,628 | (1) | Stone, sand and gravel. |
| Worcester | 1,093,770 | 1,455,050 | Sand and gravel, stone. |
| Undistributed [2] | 2,686,429 | 3,195,274 | |
| Total [3] | 25,916,277 | 27,588,146 | |

[1] Figure withheld to avoid disclosing individual company confidential data; included with "Undistributed."
[2] Includes sand and gravel and gem stones not assigned to specific counties and values indicated by footnote 1.
[3] Total adjusted to eliminate duplicating value of stone.

**Barnstable.**—Fill gravel and building and paving sand and gravel were produced in large quantities by Frederick V. Lawrence, Inc., at a stationary plant near Falmouth. Whitehead Brothers Co. produced unprocessed molding sand near Provincetown, and Concrete Products Co. of Cape Cod, Inc., produced chiefly building gravel near Falmouth. Turner & Breivogel, Inc., quarried granite for riprap at Falmouth Heights.

**Berkshire.**—Lime production by New England Lime Co. (Adams), U.S. Gypsum Co. (Farnams), and Lee Lime Corp. (Lee) increased 4 percent in 1960. Chief use for the lime was for chemical and industrial purposes, but lime was also marketed for building and agricultural purposes. Crushed limestone, produced by the above lime-burning companies plus John S. Lane & Son, Inc., at its Tobey plant, West Stockbridge, increased 8 percent. Other than for lime manufacture, limestone was used chiefly as agricultural stone, whiting, mineral food, and asphalt filler. New England Lime Co. completed engineering for the possible installation of another fluo-solids kiln of greater capacity than those currently in operation. This firm also installed a new primary crushing unit and a tube mill in the fine-grinding circuit. Work was underway on expansion of precipitated chalk facilities, including a new dryer.[5]

Almost 600,000 tons of sand and gravel was produced at 17 plants, chiefly for building and paving purposes. General Sand & Stone

[5] Pit and Quarry, vol. 53, No. 1, July 1960, p. 138.

Digitized by Google

Corp. (Dalton) was the leading producer. Other large producers, in order of decreasing output, were Berkshire Gravel, Inc., (Pittsfield and Lenoxdale), Maxymillian, Inc. (Adams), Nicholas Klein, Jr., (Adams), Abby & Sons (Lee), Frank Bushika (North Adams), and Mountain Sand & Gravel Co., Inc. (Great Barrington). Oits Chester Granite Co. quarried a small quantity of rough monumental granite.

**Bristol.**—Over 1.1 million tons of sand and gravel was produced at 16 plants, a slight decrease from 1959. Tri-City Concrete Co., Inc., of Raynham, the largest producer, went out of business at the close of 1960. Morse Sand & Gravel Co. at Attleboro and Joseph Borge & Sons, Inc., of Swansea were major producers. McCabe Sand & Gravel Co. (Taunton), Brockton Sand & Gravel Co., Inc. (South Easton), River Sand & Gravel Co. (Seekonk), and Assonet Sand & Gravel Co., Inc. (Fall River) were other large producers. The county output was mainly for building and paving uses.

Basalt for concrete aggregate was quarried by Warren Bros. Road Co. at Acushnet and Morse Sand & Gravel Co., Attleboro.

Stiles & Hart Brick Co. mined miscellaneous clay at Taunton for manufacturing building brick.

**Dukes.**—Colby Construction Co. produced sand and gravel as building and paving material at a stationary plant near Vineyard Haven.

**Essex.**—Over 800,000 tons of sand and gravel, a decrease of 14 percent from 1959, was produced at 12 sand and gravel operations. The larger firms were: Yemma Bros., Inc. (Groveland); Videtta Corp. (West Peabody); Andover Sand & Gravel, Inc. (Lawrence); Essex Sand & Gravel Co., Inc. (Andover); and Miles River Sand & Gravel Co. (Ipswich). Highway and building construction consumed the major portion of the sand and gravel output.

Crushed basalt, chiefly for concrete aggregate and roadstone, was produced by Lynn Sand & Stone Co., Swampscott; Trimount Bituminous Products Co., Saugus; and Essex Bituminous Concrete Corp., West Peabody. Output was 8 percent greater than in 1959.

Andover Sand & Gravel, Inc., produced humus peat for soil conditioning from bogs near Lawrence.

**Franklin.**—Basalt, chiefly for railroad ballast and concrete aggregate and road base, was quarried by Greenfield Massachusetts Broken Stone Co. Dimension granite, chiefly for rough architectural uses, was quarried by Rockport Quarry Co., Inc., at Rockport. This firm supplied exterior architectural stone for the Bancroft Hall additions at the U.S. Naval Academy, Annapolis, Md. Karl A. Persson quarried granite for rubble, rough construction, and curbing and flagging.

Production of sand and gravel decreased 20 percent. Output in excess of 300,000 tons was reported by five producers, the larger of which were Joseph W. Zmetra (Sunderland) and Northfield Sand & Gravel (Northfield).

**Hampden.**—Crushed basalt was produced by John S. Lane & Son, Inc., at the Hampden No. 3 quarry at Westfield. The West Springfield quarry of this company was idle in 1960.

Over 900,000 tons of sand and gravel (a slight decrease) was produced at 12 operations. As in 1959, a large tonnage of building sand and gravel was produced. The leading producers were North Wilbraham Sand & Gravel Co., Inc., North Wilbraham; Monson Sand &

Digitized by Google

Gravel Corp., Monson; D. D. Ruxton Co., Inc., Ludlow; and Bay States Gravel, Palmer.

Dimension sandstone for dressed architectural uses was quarried by McCormick Longmeadow Stone Co., Inc., at the Worcester mine near East Longmeadow. Important buildings constructed using this stone included the First Presbyterian Church, Atlanta, Ga., Wright Hall at Smith College, Northampton, Mass., and the Biology Building at Rutgers University, New Brunswick, N.J.

Miscellaneous clay for building brick was mined by Hampshire Brick Co., Chicopee, and Westfield Clay Products Co., Westfield.

**Hampshire.**—Sand and gravel production, reported by the same eight producers as in 1959, decreased over 40 percent in 1960. The decline was directly attributable to sharply reduced output of fill gravel. Leading producers were Bill Willard, Inc., Northampton; Hampshire Sand & Gravel Co., Westhampton; and John Omasta, Northampton. Crushed basalt for concrete aggregate and roadstone was produced by John S. Lane & Son, Inc., at Amherst.

**Middlesex.**—Dimension granite was quarried at Westford by Morris Bros. Granite Co., Inc., and Oak Hill Granite Co., Inc., and at West Chelmsford by the H. E. Fletcher Co. Output was at a lower rate than 1959. Basalt, chiefly for concrete aggregate and roadstone, was quarried by B. & M. Crushed Stone Co. (Ashland), J. P. Condon Corp. (Dracut), and Rowe Contracting Co. (Malden). Winchester Crushed Stone Co. did not operate its Woburn quarry. Basalt output was 22 percent greater than in 1959.

Sand and gravel production, as reported from 20 operations, increased to slightly over 3 million tons, and the county remained the leading sand and gravel producer in the State. Eight companies produced more than 200,000 tons each. They were, in order of decreasing output, Acme Sand & Gravel Co., Inc. (Burlington), J. J. Cronin Co. (Wilmington), San-Vel Contracting Co. (Littleton), Ashland Sand & Gravel, Inc. (Ashland), Pomerleau Brothers (Westford), New England Sand & Gravel Co. (Framingham), Thomas Quinn Co. (Burlington), and Assabet Sand & Gravel Co., Inc. (Acton). The output, concentrated near Boston, was chiefly for building and paving.

The Zonolite Co. exfoliated vermiculite in a plant near North Billerica for lightweight aggregate and insulation.

Eastern Gas & Fuel Associates closed its Everett coke plant at the end of April 1960, due to changes in the use of fuel by former consumers. In general, users were changing from coke, coke oven gas, and water gas to natural gas and oil.

**Nantucket.**—A small quantity of paving sand was produced by the Nantucket Construction Co.

**Norfolk.**—Sand and gravel, largely for building, was mined at eight pits. The larger producers were Highland Sand & Gravel, Inc., West Roxbury; Wrentham Sand & Gravel Co., Inc., Wrentham; Boston Sand & Gravel Co., Canton; and Varney Bros. Sand & Gravel, Inc., Bellingham.

Crushed granite for roadstone and stone sand was quarried by Old Colony Crushed Stone Co. and Simeone Stone Corp. at Quincy and Wrentham, respectively. Bates Brothers Seam Face Granite Co. and J. S. Swingle, Inc., quarried dimension granite at Wey-

Digitized by Google

mouth and Quincy. Orders executed included architectural stone for exterior use in Boston College buildings, Boston, Mass., and at St. Gregory's Church, Cincinnati, Ohio. S. M. Larusso & Sons, Inc., quarried miscellaneous stone at Wrentham for roofing granules.

California Products Corp. exfoliated vermiculite imported from South Africa at Hingham, chiefly for plaster aggregate and insulation.

**Plymouth.**—Eleven sand and gravel producers reported total output of over 440,000 tons of sand and gravel. The leading producers were Boston Sand & Gravel Co. at Scituate; Marshfield Sand & Gravel Co., Marshfield; and Whitehead Brothers Co. at Marion and Onset. Output was chiefly for building and paving, but Whitehead Brothers produced molding sand.

Southeastern Stone, Inc., quarried basalt for concrete and roadstone and riprap at Taunton and crushed granite for the same uses at Hingham.

Miscellaneous clay was produced by Bridgewater Brick Co. (East Bridgewater) and Stiles & Hart Brick Co. (South Bridgewater). Output, used entirely for building brick, decreased 25 percent. These two affiliated firms were installing an up-to-date laboratory and new beehive kilns to replace scove kilns at the South Bridgewater location. The plant was to be converted from making molded common brick to making molded face brick of various colors and textures.[6]

**Suffolk.**—West Roxbury Crushed Stone Co., West Roxbury, crushed basalt for concrete aggregate and roadstone. Bank run gravel for fill and other uses was produced by D. B. Raymond at a stationary plant near Watertown. Crude perlite from Western States was expanded by The Whittemore Co., Permalite Division, at Roslindale. The expanded product was used for building plaster, concrete aggregate, and soil conditioning. Imported gypsum was calcined at Charlestown by the United States Gypsum Co. Distribution was chiefly to the New England States.

**Worcester.**—Sixteen producers of sand and gravel reported output in 1960, chiefly for building, paving, and fill. Leading producers included Worcester Sand & Gravel Co. (Shrewsbury), Rosenfeld Washed Sand & Stone Co. (Milford), DeFalco Concrete Corp. (Millbury), P. J. Keating Co. (Lunenburg), E. L. Dauphinais, Inc. (North Grafton), Direnzo Bros. Sand & Gravel, Inc. (Worcester), and Allaire Bros. (Auburn). Pandolf, Inc., Sterling, a new firm in 1960, produced basalt for concrete and roadstone. Holden Trap Rock Co. quarried basalt for roadstone and for use in the manufacture of bituminous concrete at Holden. The H. E. Fletcher Co. dimension granite quarry at Milford did not operate during 1960.

Bettinger Corp., Milford, began mass production of ceramic coated materials following a period of extensive research and development. Ceramic-coated mufflers and tailpipes, and ceramic-coated corrugated roofing, siding, and accessories, were the principal products sold.

# The Mineral Industry of Michigan

**This chapter has been prepared under a cooperative agreement for the collection of mineral data, except mineral fuels, between the Bureau of Mines, U.S. Department of the Interior, and the Michigan Department of Conservation, Geological Survey Division, State of Michigan.**

By Donald F. Klyce [1]

EXPANDED PRODUCTION of petroleum and increased shipments of iron ore were chiefly responsible for increasing the value of Michigan mineral production to a new high, 13 percent more than in 1959. Declines in shipments of cement, clays, and gypsum reflected a lag in building construction. A slower pace in road building resulted in a smaller demand for concrete aggregate and roadstone. Production of salt and chemicals derived from well brines also was below the 1959 level.

Iron ore regained first place in value, displacing cement which was second, followed by petroleum, sand and gravel, copper, salt, and stone.

**TABLE 1.—Mineral production in Michigan [1]**

| Mineral | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value (thousands) | Quantity | Value (thousands) |
| Cement: | | | | |
| Portland ---- thousand 376-pound barrels | 21,682 | $72,198 | 21,187 | $73,082 |
| Masonry ---- do | 1,344 | 5,126 | 1,174 | 4,612 |
| Clays ---- thousand short tons | 1,771 | 1,937 | 1,738 | 1,904 |
| Copper (recoverable content of ores, etc.) ---- short tons | 55,300 | 33,954 | 56,385 | 36,199 |
| Gypsum ---- thousand short tons | 1,721 | 6,595 | 1,463 | 5,609 |
| Iron ore (usable) ---- thousand long tons, gross weight | 7,247 | 62,921 | 10,792 | 95,791 |
| Lime ---- thousand short tons | 862 | 11,748 | 1,177 | 15,730 |
| Manganiferous ore (5 to 35 percent Mn) short tons, gross weight | ---- | ---- | 180,460 | (2) |
| Natural gas ---- million cubic feet | 18,916 | 4,350 | 20,790 | 4,449 |
| Peat ---- short tons | 191,661 | 2,357 | 214,402 | 2,755 |
| Petroleum (crude) ---- thousand 42-gallon barrels | 10,439 | 30,691 | [3] 15,665 | [3] 45,585 |
| Salt ---- thousand short tons | 4,485 | 35,725 | 4,088 | 33,759 |
| Sand and gravel [4] ---- do | 48,052 | 41,193 | 46,910 | 39,304 |
| Stone ---- do | 30,095 | 30,379 | 31,256 | 32,274 |
| Value of items that cannot be disclosed: Bromine, calcium-chloride and calcium-magnesium chloride, gem stones, magnesium compounds, natural gas liquids, potassium salts, and values indicated by footnote 2 | ---- | 49,371 | ---- | 45,864 |
| Total Michigan [5] | ---- | 381,297 | ---- | 429,055 |

[1] Production as measured by mine shipments, sales, or marketable production (including consumption by producers).
[2] Figure withheld to avoid disclosing individual company confidential data.
[3] Preliminary figure.
[4] Includes friable sandstone.
[5] Total adjusted to eliminate duplicating value of clays and stone.

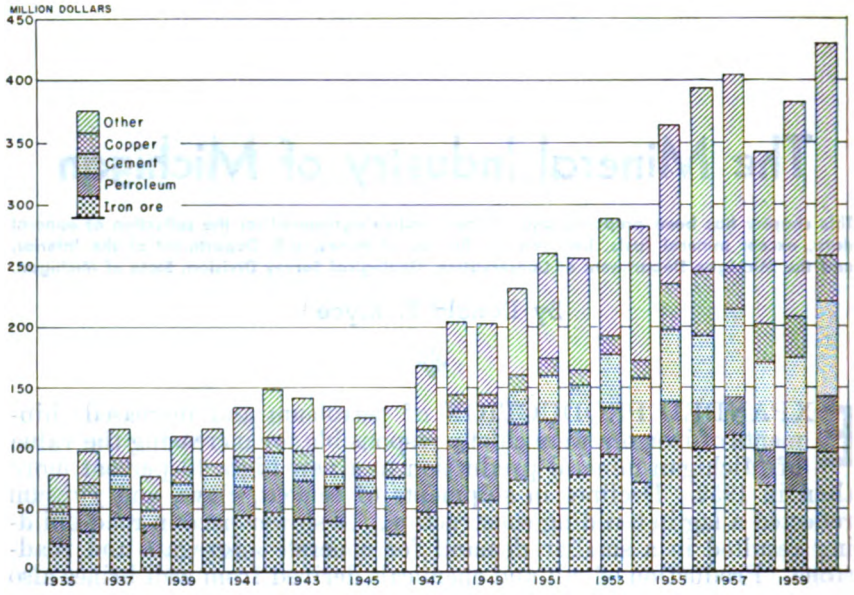

FIGURE 1.—Value of iron ore, petroleum, cement, copper, and total value of all minerals in Michigan 1935–60.

**Employment and Injuries.**—Preliminary data for the mineral industry indicated that man-hours worked in the iron-mining industry increased in 1960 as industry recovered from the long steel strike of 1959. Man-hours worked in the limestone industry, which had to meet larger demands for flux stone from the steel industry, also increased. A lag in building construction was indicated by the decline in man-hours worked in industries supplying cement, clays, gypsum, and sand and gravel. Data represent virtually complete coverage for most mineral commodities.

Three large limestone quarries, the Calcite and Cedarville quarries of the Michigan Limestone Division, United States Steel Corp., and the Alpena quarry of the Huron Portland Cement Co., again maintained excellent safety records. The Grand Rapids mine of the Bestwall Gypsum Co. also operated without lost-time injuries.

[2] Total number of injuries per million man-hours.
[3] Total number of days lost or charged per million man-hours.
[4] Includes cement plants and quarries or pits producing raw material used in manufacturing cement.
[5] Data not available.
[6] Excludes pits producing clay used exclusively in manufacturing cement.
[7] Excludes quarries producing limestone used exclusively in manufacturing cement and lime.
[8] Preliminary figures.

# REVIEW BY MINERAL COMMODITIES

## NONMETALS

**Cement.**—Shipments of cement decreased 3 percent in quantity, but increased slightly in value over 1959. Production was reported from nine plants with total capacity over 31 million barrels, in seven counties. Stocks of portland cement at mills at yearend were 2.7 million barrels, down 216,000 barrels from the beginning of the year.

The average mill value of portland cement was $3.45 a barrel, compared with $3.33 in 1959. The average value of masonry cement was $3.93 a barrel compared with $3.81 in 1959.

Digitized by Google

Over 63 percent of the cement shipped was used within the State. Shipments out of State went mainly to Illinois, Ohio, Wisconsin, and New York, with small quantities to Minnesota, Indiana, North Dakota, and Pennsylvania.

Crude materials used in the manufacture of cement included 5.3 million tons of limestone, 1.6 million tons of clay or shale, and substantial quantities of gypsum, coal, sand, lime mud, glass sludge, slag, air-entraining compounds, and mill scale and pyrite cinders.

**TABLE 3.—Finished portland cement produced, shipped, and in stock**

(Thousand barrels and thousand dollars)

| Year | Active plants | Production | Shipped from mills | | Stocks at mills Dec. 31 |
|---|---|---|---|---|---|
| | | | Quantity | Value | |
| 1951-55 (average) | 7 | 15,919 | 15,913 | $42,369 | 1,465 |
| 1956 | 8 | 20,485 | 20,237 | 61,749 | 1,779 |
| 1957 | 8 | 21,015 | 20,590 | 65,996 | 2,204 |
| 1958 | 8 | 19,841 | 19,691 | 65,738 | 2,443 |
| 1959 | 8 | 21,561 | 21,682 | 72,198 | [1] 2,912 |
| 1960 | 9 | 20,971 | 21,187 | 73,082 | 2,696 |

[1] Revised figure.

**Clays.**—Miscellaneous clay and shale production decreased 2 percent from 1959. Nearly 87 percent of the material mined was used in manufacturing cement. Other uses were in heavy clay products (building brick, paving brick, draintile, and sewer pipe), lightweight aggregate, art pottery, and miscellaneous.

Clay or shale was produced in 10 counties at 17 operations. Alpena, Wayne, and Saginaw Counties reported the largest production.

**Gem Stones.**—Collection of agate, native iron and copper specimens, Petoskey limestone, celestite, sulfur, salt, dolomite, and alabaster was reported. Most of the agate was found on Lake Superior beaches of the Northern Peninsula.

**Gypsum.**—Gypsum was quarried in Iosco County and mined underground near Grand Rapids in Kent County. The raw material was processed at plants in National City, Grand Rapids, and Detroit. Crude gypsum also was shipped to plants in Illinois and Ohio. Principal products were plasterboard, exterior sheathing, lath, and plaster. Production was 15 percent below 1959 output, reflecting a decreased demand from the building industry.

Digitized by Google

**Lime.**—Lime production was reported from plants in Bay, Chippewa, Ingham, Mason, Menominee, and Wayne Counties. Five manufacturers produced only quicklime, one company produced only hydrated lime, and one produced both. Annual lime-burning capacity of the plants exceeded 1 million tons.

Principal uses for lime were for producing alkalis and other chemicals used in metallurgy, paper manufacture, and sugar refining. Production was 37 percent higher than in 1959. A new plant in Wayne County helped to increase output in 1960.

**Natural Salines.**—Natural well brines from two geological formations were source material for bromine, calcium chloride, calcium-magnesium chloride, magnesium compounds, and potash. Brines from the Filer sandstone supplied chemical plants in Mason and Manistee Counties; plants in Gratiot, Lapeer, and Midland Counties recovered chemicals from brines of the Sylvania formation. Production of chemicals from these sources decreased 10 percent from the previous year.

**Perlite.**—Perlite was expanded at plants in Grand Rapids and National City from crude ore mined in Colorado and Nevada, and used chiefly in building plaster. Small quantities were used for concrete aggregate, soil conditioning, and other applications.

**Salt.**—Salt production came from natural brines of the Dundee and Marshall formations, artificial brines formed by dissolving salt from the Salina formation, and one underground mine. Production was reported from 10 plants in six counties. Largest production came from Wayne County, which included output of International Salt Co.'s underground mine and artificial brine operations of Pennsalt Chemical Corp. and Wyandotte Chemicals Corp. Production of salt in Michigan was 9 percent less than in 1959. Although declines were noted for most use categories, the largest declines were in the manufacture of soda ash and ice control on highways.

Salt was used for a wide variety of industrial purposes; a major portion by the chemical industry. Large tonnages were purchased by Government agencies for ice control on highways.

**Sand and Gravel.**—Sand and gravel was produced from glacial deposits, present-day beaches, river channels, lakes, and sand dunes. Production was reported from all 83 counties.

Output of sand and gravel was 2 percent less than in 1959. Slightly decreased activity in highway construction and lesser demand from the building industry were partly responsible for the decline.

Digitized by Google

**TABLE 4.—Sand and gravel sold or used by producers, by classes of operations and uses**

(Thousand short tons and thousand dollars)

| Class of operation and use | 1959 | | 1960 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Commercial operations: | | | | |
| Sand: [1] | | | | |

| Grand total | 48,052 | 41,193 | 46,910 | 39,304 |

[1] Includes friable sandstone.
[2] Includes railroad ballast, blast, glass, grinding and polishing, and other ground and unground industrial sands.
[3] Included with "Other" gravel to avoid disclosing individual company confidential data.

Sand requirements for industrial uses—molding, glass, blasting, grinding, polishing, and other—decreased 7 percent from 1959.

Nearly 43 million tons of sand and gravel was moved by truck, 2.3 million tons by rail, and 1.6 million tons by water.

Operations in the Detroit area (Livingston, Macomb, Oakland, Washtenaw, and Wayne Counties) produced over 28 percent of the sand and gravel. Major production also came from Berrien, Calhoun, Genesee, Ingham, Kent, Muskegon, Ottawa, and Tuscola Counties.

Production was reported from 267 commercial operations and 122 Government-and-contractor operations.

Digitized by Google

The 10 largest producers, listed alphabetically, were:

**American Aggregates Corp. (Kalamazoo, Livingston, and Oakland Counties)**
**Construction Aggregates Corp. (Ottawa County)**
**O. E. Gooding & Co. (portable operation)**
**Grand Rapids Gravel Co. (Kent County)**
**Pickitt & Schreur, Inc. (portable operation)**
**Sand Products Corp. (Manistee and Muskegon Counties)**
**Sargent Sand Co. (Mason and Tuscola Counties)**
**Straits Aggregate & Equipment Corp. (portable operation)**
**Walker Sand & Gravel Co. (Oakland County)**
**John G. Yerington (portable operation)**

**Stone.**—Basalt, limestone, marl, and sandstone were produced.

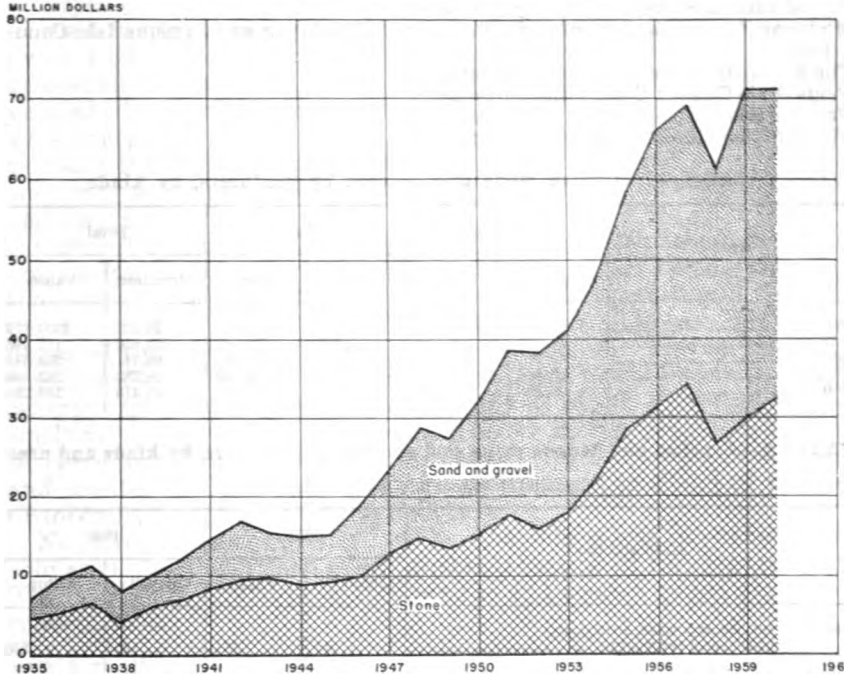

**FIGURE 2.—Value of sand and gravel and stone in Michigan 1935–60.**

*Basalt.*—Basalt from Precambrian rocks was quarried in Houghton County. It was crushed for road use.

*Limestone.*—Small quantities of dimension limestone was quarried in Charlevoix, Eaton, Huron, and Presque Isle Counties. Production was for rough construction, rubble, cut stone, and flagging.

Limestone was quarried and crushed in 19 counties by 21 producers at 24 sites and by 5 Government-and-contractor producers. Most of the output came from counties in the northern part of the State in the area bordering Lakes Huron and Michigan. Several large operators maintained port facilities near their quarry and mill sites. Over 25 million tons was moved by water to industrial users (cement and lime plants, steel mills, and other industries). The marketing area

Digitized by Google

via the Great Lakes included Michigan, Illinois, Indiana, Minnesota, New York, Ohio, and Pennsylvania. Crushed limestone shipments were 4 percent larger than in 1959. Of the 31 million tons shipped, 12.3 million tons was used by the steel industry for flux, 12.6 million tons by cement, chemical, and lime manufacturers, and 5.4 million by concrete aggregate and roadstone consumers. Miscellaneous uses, including agricultural limestone, made up the balance.

The largest producers, in alphabetical order, were:

Drummond Dolomite, Inc. (Chippewa County)
Dundee Cement Co. (Monroe County)
The France Stone Co. (Monroe County)
Huron Portland Cement Co. (Alpena County)
Inland Lime & Stone Co. (Mackinac County)
Michigan Limestone Div. of U.S. Steel Corp. (Mackinac and Presque Isle Counties)
The Michigan Stone Co. (Monroe County)
Penn-Dixie Cement Corp. (Emmet County)
Presque Isle Corp. (Presque Isle County)
The Wallace Stone Co. (Huron County)

**TABLE 5.—Dimension stone sold or used by producers, by kinds**

| Year | Limestone | | Sandstone | | Total | |
|---|---|---|---|---|---|---|
| | Short tons | Value | Short tons | Value | Short tons | Value |
| 1956 | 35,017 | $110,159 | 11,190 | $90,820 | 46,207 | $200,979 |
| 1957 | 34,741 | 105,854 | 17,889 | 70,142 | 52,630 | 175,996 |
| 1958 | 50,965 | 120,361 | 18,776 | 132,981 | 69,741 | 253,342 |

| Grand total | 30,067 | 30,167 | 31,238 | 32,118 |

[1] Includes limestone for refractory (1959), riprap, railroad ballast, chemical uses, whiting or whiting substitutes, asphalt filler, dust for coal mines, mineral food, poultry grit, stone sand, cement, lime, and other miscellaneous purposes.

Digitized by Google

*Marl.*—Marl pits in 17 counties yielded 159,345 tons of material; all was used to neutralize acid soils. Production dropped 21 percent from 1959. Principal output was from Allegan, Calhoun, Kalamazoo, and St. Joseph Counties.

*Sandstone.*—Dimension sandstone was quarried in Baraga, Hillsdale, and Jackson Counties. It was used principally for rough construction, rubble, dressed or cut stone, and flagging.

**Sulfur.**—Byproduct sulfur was recovered from crude petroleum in Detroit at the Aurora refinery of the Ohio Oil Co. The Clauss process was used.

## METALS

**Copper.**—Production of copper was up 2 percent over 1959. A 2-cent increase in the average price per pound raised the value of shipments by over $2 million. Although the Michigan copper industry showed an overall increase over 1959, a decline began in the latter part of the year which reflected reduced activity in the durable goods field, world-wide overproduction of copper, and a consequent drop in price, particularly in the last quarter of 1960.

Output was reported from 9 underground mines and 3 tailing reclamation plants.

Calumet & Hecla, Inc., operated 7 mines, one reclamation plant, and one smelter in Houghton and Keweenaw Counties. During the year the company introduced a high-conductivity lithium deoxidized copper for possible use in the field of electronics. Copper Range Co. operated the Champion mine and the Freda mill. The mill concentrated ore from the mine and tailing from the Redridge sands. Concentrate from the mill was processed at the White Pine Copper Co. smelter. Quincy Mining Co. operated a reclamation plant and smelter in Houghton County. White Pine Copper Co. operated a mine, mill, and smelter in Ontonagon County. A labor strike that had started October 28, 1959, was settled on February 22.

No silver was recovered in 1960 but the output was fire-refined and sold as "Lake copper" at a slight premium because of its silver content. The average weighted price increased to 32.1 cents a pound from 30.7 cents in 1959.

**TABLE 7.—Mine production of copper in 1960, by months, in terms of recoverable metal**

| Month | Short tons | Month | Short tons |
|---|---|---|---|
| January | 1,845 | August | 5,370 |
| February | 2,110 | September | 5,310 |
| March | 5,290 | October | 5,160 |
| April | 5,290 | November | 5,230 |
| May | 5,290 | December | 5,205 |
| June | 5,695 | | |
| July | 4,590 | Total | 56,385 |

Digitized by Google

TABLE 8.—Mine production of copper, in terms of recoverable metal

| Year | Mines producing | | Material treated | | Copper | |
|---|---|---|---|---|---|---|
| | Lode | Placer | Ore (short tons) | Tailing (short tons) | Short tons | Value |
| 1951–55 average | 10 | 2 | 2,842,141 | 1,985,772 | 38,987 | $17,538,587 |
| 1956 | 11 | 3 | 4,427,965 | 2,257,209 | 41,226 | 22,257,240 |
| 1957 | 14 | 3 | 5,459,654 | 2,274,565 | 59,406 | 35,556,400 |
| 1958 | 11 | 2 | 3,457,473 | 1,336,177 | 39,915 | 30,510,550 |
| 1959 | 10 | 3 | 3,999,233 | 1,440,457 | 52,201 | 37,454,359 |
| 1960 | 9 | 3 | 3,900,250 | 2,282,915 | 58,265 | 36,290,170 |

The price quoted by primary producers for electrolytic copper, delivered, opened in 1960 at 33 cents a pound, rose to a high of 34.5 cents in January. On October 13 it was quoted at 30 cents, the price which held for the balance of the year.

**Iron Ore.**—Iron-ore shipments were nearly 50 percent larger than in 1959, although they fell short of the 10-year average. After midyear the increased demand resulting from the 1959 strike began to lag and shipments fell off and stocks at the mines increased. By yearend stocks of crude ore were nearly 500,000 tons larger than at the end of 1959. Twenty-two underground and five open-pit mines were active.

Mining costs declined below the 1959 level as well as below the 5-year average. According to a study by the Michigan Department of Conservation,[2] the average cost per ton (delivered at Lake Erie ports) for underground mines was $10.69 in 1960 compared with $11.34 in 1959. The cost per ton for labor fell to $3.07 from $3.46, supplies to $1.42 from $1.52, taxes (excluding Federal income tax) to $0.60 from $0.84, and general overhead to $1.16 from $1.19. Marketing costs remained at $0.77, and transportation costs decreased $0.09 to $3.11 from $3.20.

TABLE 9.—Crude iron ore[1] data in 1960, by counties and ranges

(Thousand long tons)

| County and range | Stocks of crude ore Jan. 1 | Production | | Shipments | | Stocks of crude ore Dec. 31 |
|---|---|---|---|---|---|---|
| | | Underground | Open pit | Direct to consumers | To beneficiation plants | |

[1] Exclusive of iron ore containing 5 percent or more manganese, natural.
[2] Distribution by range partly estimated before 1906.

On the Gogebic range, average cost per ton (delivered at Lake Erie ports) for underground mines was $11.80 in 1960 and $13.10 in 1959; on the Marquette range, costs fell to $10.88 from $11.63; and on Menominee range to $9.87 from $10.08. The decline in costs resulted from the closing of higher-cost mines as demand fell off.

Of the ore mined in 1960, 28 percent came from open pits and 72 percent from underground mines. Average iron content of usable ore produced was 53.79 percent natural.

The trend to the use of concentrate from jaspilite ores continued, and 11.6 percent of iron-ore shipments were from this source, compared with 8.5 percent in 1959.

At yearend estimated reserves of iron ores in Michigan totaled 124 million tons,[3] not including about 1.8 billion tons[4] of low-grade hematitic ore.

The average weighted mine value of Michigan iron ore, without respect to grade, was $8.88 a long ton compared with $8.68 in 1959.

Except for a small quantity of crude ore used in manufacturing iron-oxide pigments, Michigan iron ore was shipped to producers of pig iron and steel. Approximately 98 percent of the iron ore shipped was transported by rail to ore docks at Ashland, Wis., and Escanaba

Digitized by Google

and Marquette, Mich., and thence by vessel to lower Lake ports. The balance was all rail shipments to consuming districts.

Dates of first and last Lake shipments of ore in 1960 from Michigan and Wisconsin ports were: Ashland, April 17—November 6; Escanaba, March 28—November 17; Marquette, April 16—November 26; Superior, April 19—November 18.

Manganiferous ore.—Shipments of manganiferous ore containing 5 to 10 percent manganese (natural) was resumed from the Cannon mine in Iron County. Production was not significant as a source of manganese. The ore was sold as an iron ore and a premium was paid for the contained manganese.

**Peat.**—Peat production increased for the eighth consecutive year. It was produced from bogs in 17 countries, with the largest production reported from Sanilac, St. Clair, Lapeer, and Oakland Counties. Output was sold mainly as a soil conditioner.

**Petroleum.**—The upward trend in petroleum production, which began in 1959 after 11 years of decline, continued in 1960. Output was 50 percent greater than in 1959. According to data published by the Michigan Department of Conservation,[5] exploratory and development well permits increased 27 percent, totaling 824. Exploratory wells drilled during the year resulted in four new oil fields, four new gas-fields, one new oil pool, and six extensions. Exploratory methods employed in these 15 discoveries were: Subsurface geology—five; trend geology—six; gravity—three; and nontechnical—one. Undeveloped acreage under lease exceeded 3.6 million acres.

Most of the drilling and half of the oil production were in fields of the Albion-Pulaski-Scipio trend in Calhoun, Hillsdale, and Jackson Counties in southern Michigan. Output in this area quadrupled from 2 million barrels in 1959 to nearly 8 million barrels. New pools and extensions extended the fracture zone to 38 miles. In 1960, 235 oil wells were completed along the trend.

During the latter part of the year attention shifted to further exploration of Niagaran reefs in eastern Michigan. These reefs are characterized by unstratified coral buildups, with crude sorting around the flanks. Oil and gas was produced from the overlying dolomite and the reef. Favorable economic factors included accessibility, marketing facilities, and relatively shallow depth.

Petroleum was produced in 40 counties. In addition to the areas described above, output in Bay, Isabella, Missaukee, Montcalm, and Osceola Counties each exceeded 500,000 barrels. Fourteen refineries, with a rated crude throughput capacity of 174,000 barrels daily, were operated.

**TABLE 13.—Value of mineral production in Michigan, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |

## REVIEW BY COUNTIES

All 83 counties reported mineral production, with Marquette replacing Wayne as the leading producing county. Sand and gravel was produced in all 83 counties and was the only mineral commodity reported in 13.

The value of mineral production exceeded $1 million in 46 counties. The value of output increased in 46 counties and decreased in 37. The largest losses were recorded in counties producing sand and gravel.

**Allegan.**—Petroleum and natural gas were the major mineral commodities. Allegan County led in natural gas output. Marl, peat, and sand and gravel also were produced. Sand and gravel, used mostly for road construction, was mined at nine sites.

**Alpena.**—Huron Portland Cement Co. manufactured portland and masonry cements at Alpena using locally produced limestone and clay. Sand and gravel was produced at three sites for building and paving use.

**Antrim.**—Penn-Dixie Cement Co. mined clay for use at its Petoskey cement plant. The State and county highway department mined sand and gravel for road use.

**Arenac.**—Roadstone and sand and gravel for paving and building use were produced at six sites. Petroleum was produced at five fields. Nearly two-thirds of the output came from the Deep River and Sterling fields.

**Baraga.**—Cleveland-Cliffs Iron Co. resumed production of iron ore from its Ohio open-pit mine. Road material was mined at two sand and gravel pits, and a small quantity of sandstone was quarried for building purposes.

**Barry.**—Sand and gravel for building and paving use was produced at five pits. Marl for agricultural use was produced near Caledonia and Nashville. Petroleum was produced from three fields. The Hope field had the largest output.

**Bay.**—Aetna Portland Cement Co. produced portland and masonry cements at Bay City. Over 500,000 barrels of petroleum was produced, with the major part coming from the Kawkawlin field. Crude oil was refined at Bay City by the Bay Refining Corp. Monitor Sugar Div. of the Robert Gage Coal Co. produced lime for its own use.

**Berrien.**—Eight sand and gravel operations produced over $1 million of material for building, paving, and industrial (chiefly molding sand) purposes. Small quantities of marl and peat also were produced.

**Branch.**—Sand and gravel output from four sites was used for fill, building, and paving purposes. Marl was produced from a pit near Quincy. Five marl pits in the Sherwood area, that produced in 1959, were idle during the year.

**Calhoun.**—Petroleum was the major mineral commodity. Output was over 2.4 million barrels from fields of the Albion-Pulaski-Scipio trend, an increase of over 2 million barrels above that of 1959.

The value of sand and gravel produced declined sharply from $3 million to less than $750,000 chiefly because of a contract by the State

## REVIEW BY COUNTIES

All 83 counties reported mineral production, with Marquette replacing Wayne as the leading producing county. Sand and gravel was produced in all 83 counties and was the only mineral commodity reported in 13.

The value of mineral production exceeded $1 million in 46 counties. The value of output increased in 46 counties and decreased in 37. The largest losses were recorded in counties producing sand and gravel.

**Allegan.**—Petroleum and natural gas were the major mineral commodities. Allegan County led in natural gas output. Marl, peat, and sand and gravel also were produced. Sand and gravel, used mostly for road construction, was mined at nine sites.

**Alpena.**—Huron Portland Cement Co. manufactured portland and masonry cements at Alpena using locally produced limestone and clay. Sand and gravel was produced at three sites for building and paving use.

**Antrim.**—Penn-Dixie Cement Co. mined clay for use at its Petoskey cement plant. The State and county highway department mined sand and gravel for road use.

**Arenac.**—Roadstone and sand and gravel for paving and building use were produced at six sites. Petroleum was produced at five fields. Nearly two-thirds of the output came from the Deep River and Sterling fields.

**Baraga.**—Cleveland-Cliffs Iron Co. resumed production of iron ore from its Ohio open-pit mine. Road material was mined at two sand and gravel pits, and a small quantity of sandstone was quarried for building purposes.

**Barry.**—Sand and gravel for building and paving use was produced at five pits. Marl for agricultural use was produced near Caledonia and Nashville. Petroleum was produced from three fields. The Hope field had the largest output.

**Bay.**—Aetna Portland Cement Co. produced portland and masonry cements at Bay City. Over 500,000 barrels of petroleum was produced, with the major part coming from the Kawkawlin field. Crude oil was refined at Bay City by the Bay Refining Corp. Monitor Sugar Div. of the Robert Gage Coal Co. produced lime for its own use.

**Berrien.**—Eight sand and gravel operations produced over $1 million of material for building, paving, and industrial (chiefly molding sand) purposes. Small quantities of marl and peat also were produced.

**Branch.**—Sand and gravel output from four sites was used for fill, building, and paving purposes. Marl was produced from a pit near Quincy. Five marl pits in the Sherwood area, that produced in 1959, were idle during the year.

**Calhoun.**—Petroleum was the major mineral commodity. Output was over 2.4 million barrels from fields of the Albion-Pulaski-Scipio trend, an increase of over 2 million barrels above that of 1959.

The value of sand and gravel produced declined sharply from $3 million to less than $750,000 chiefly because of a contract by the State

Digitized by Google

highway department was completed. Output came from eight pits. A small quantity of marl for agricultural purposes also was produced.

**Cass.**—Marl was dug from pits near Cassopolis and Jones. Sand and gravel was produced at four sites.

**Charlevoix.**—Limestone quarried at Vanderbilt by the Charlevoix Lime and Stone Co. was used for rough construction, flux, and agstone. The county and State highway departments produced road material from sand and gravel pits.

**Cheboygan.**—Roadstone was produced by the Afton Stone & Lime Co. Paving material was mined from gravel pits by Hugh Mason & Sons (Gaylord) and the Michigan State Highway Department.

**Chippewa.**—Limestone was quarried on Drummond Island by Drummond Dolomite, Inc. The material was crushed and sold as flux, and for concrete aggregate and roadstone, agstone, and stone sand. Sand and gravel for paving purposes was produced by I. L. Whitehead Co. of Sault Ste. Marie.

**Clare.**—Over 400,000 barrels of petroleum was produced at nine fields. Largest production came from the Hamilton, Headquarters, and Skeels fields. Over 317 million cubic feet of natural gas also was produced, chiefly from the North Hamilton and Headquarters fields. A small quantity of sand and gravel was produced by the State highway department.

**Clinton.**—Grand Ledge Clay Products Co. mined miscellaneous clay for manufacturing heavy clay products. Sand and gravel was produced at four sites. Humus peat, for horticultural use, was dug from a bog near Ovid.

**Crawford.**—Over 150,000 barrels of petroleum and nearly 1 billion cubic feet of natural gas was produced from the Beaver Creek field. Sand and gravel for road use was produced at two sites.

**Delta.**—Road material was produced from one limestone quarry and four sand and gravel pits. Two pits produced sand and gravel for building purposes only.

**Dickinson.**—The Groveland open-pit iron mine was operated by M. A. Hanna Co. The jaspilite ore was shipped to a concentrating plant near Randville. The Cornell and Bradley mines remained closed. Limestone was quarried by the Metro-Nite Co. near Felch, and the material was shipped to the company mill in Wisconsin and crushed and sold as filler. Jupiter Rock Products Co. of Sagola also quarried and crushed limestone. Sand and gravel for road use was produced at three pits.

**Eaton.**—Miscellaneous clay for use in manufacturing heavy clay products was mined by American Vitrified Products Co. and Grand Ledge Clay Products Co. Cheney Limestone Co. operated a quarry near Bellevue and crushed the output for concrete aggregate, roadstone, and agstone. Some rubble was also produced. Sand and gravel was produced at seven sites. A small quantity of moss peat was dug and sold for horticultural use.

**Emmet.**—The Penn-Dixie Cement Corp. plant at Petoskey manufactured portland and masonry cements and also quarried limestone for use in the plant. The State highway department produced road gravel.

Digitized by Google

**Genesee.**—A small quantity of petroleum was produced from the Otisville field. Eight sand and gravel pits yielded material valued at over $750,000. Foundry sand, fill, and building and paving material were produced.

**Gladwin.**—Petroleum, totaling 445,000 barrels, was produced from 12 fields. The Buckeye and Skeels fields had the largest output. A small amount of gravel for road use was produced.

**Gogebic.**—Pickands Mather & Co. produced iron ore from the Geneva-Newport, Peterson, and Sunday Lake underground mines. North Range Mining Co. operated the Penokee mine. Sand and gravel was produced at four sites.

**Gratiot.**—Michigan Chemical Co. produced bromine, calcium chloride, magnesium compounds, and salt at its St. Louis plant from well brines. During the year the company acquired from the U.S. Atomic Energy Commission (AEC) a rare-earth ion-exchange facility at St. Louis. The unit was originally built by Michigan Chemical Co. for production of rare-earth oxides for AEC. After the contract expired in 1959, the facility was placed on a standby basis and then declared surplus.

Sand and gravel was produced at four operations. Over 200,000 barrels of petroleum was produced, mostly from Sumner field. Leonard Refineries, Inc., operated two crude oil refineries at Alma.

**Hillsdale.**—Petroleum output was the largest of any county in the State. Production increased to nearly 3.7 million barrels from 1.3 million in 1959 and came from fields of the Albion-Pulaski-Scipio trend. Pits near Hanover and Reading yielded marl and a quarry near Hillsdale produced sandstone for flagging. Eight operators reported sand and gravel production.

**Houghton.**—Copper was produced by Calumet & Hecla, Inc., Calumet; Copper Range Co., Painesdale; and Quincy Mining Co., Hancock.

Calumet & Hecla, Inc., operated the Ahmeek No. 2, Allouez H. C. and Allouez conglomerate, Centennial No. 2, Peninsula, Seneca, and Osceola No. 13 mines. New centralized pumping facilities were installed on the Osceola lode. Explorations included over 13,000 feet of drifting and nearly 15,000 feet of diamond drilling.

Copper Range Co. operated the Champion mine throughout the year and milled the output at the Freda mill. Tailing from the Redridge sands also was treated at the Freda mill. Concentrates were processed at the White Pine Co. smelter in Ontonagon County.

Quincy Mining Co. operated its tailing reclamation plant continuously throughout the year, and the concentrate was smelted at the company smelter at Hancock.

Limestone Mountain Co. produced agricultural limestone, and the Houghton County Road Commission quarried basalt for use as roadstone. Road material was produced from three gravel pits.

**Huron.**—Limestone was quarried and crushed for concrete aggregate and roadstone, railroad ballast, and agstone by Wallace Stone Co., Bay Port. Some rough construction stone also was produced. Five operators produced sand and gravel. The Dwight and Grant fields yielded a small quantity of petroleum.

Digitized by Google

**Ingham.**—The Lansing Board of Water and Light produced quicklime for its own consumption from calcium carbonate precipitated in the water purification process. Roadstone was quarried from a limestone deposit by Central Michigan Sand and Gravel, East Lansing. Fourteen sand and gravel operations yielded materials valued at over $900,000.

**Ionia.**—The part of the Bloomer field lying in Ionia County yielded a small quantity of petroleum. Sand and gravel production was up as portable plant operators resumed work in the county. The material was used mostly for road construction. Limestone quarried near Ionia was crushed for use as concrete aggregate and roadstone.

**Iosco.**—Gypsum mines were operated near Tawas City by National Gypsum Co. and near Alabaster by United States Gypsum Co. National Gypsum Co. also operated a processing plant at National City and port facilities on Tawas Bay for shipment to its plants in Illinois and Ohio. The county highway department produced a small quantity of road gravel.

**Iron.**—The value of mineral production increased over 50 percent because of greater iron-ore production. The M. A. Hanna Co. operated the Cannon, Hiawatha, Homer, and Wauseca mines. Inland Steel Co. operated the Bristol and Sherwood mines, Pickands Mather & Co. the Buck unit, and Republic Steel Corp. the Tobin Group. Shipments of manganiferous ore were resumed from the Cannon mine. Road material was produced from two sand and gravel operations.

**Isabella.**—More than 760,000 barrels of petroleum and 300 million cubic feet of natural gas were produced. The Coldwater field was the principal producer. Marl for agricultural purposes was mined near Weidman, and sand and gravel production was reported by four operators. Crude oil was refined at Mt. Pleasant by Leonard Refineries, Inc.

**Jackson.**—The Pulaski field section of the Albion-Pulaski-Scipio trend yielded 1.8 million barrels of petroleum, up from 200,000 barrels in 1959. More than 600 million cubic feet of natural gas also was produced. Sandstone for building use was quarried at three sites near Napoleon. Crushed limestone for concrete aggregate, roadstone, and agstone was produced by Jeffrey Limestone Co., Parma. A pit near Horton yielded marl for agricultural use. Sand and gravel was produced at six sites and was used mostly for building and road construction.

**Kalamazoo.**—Peat for horticultural use was dug from bogs near Kalamazoo and Scott. Marl for agricultural use was produced at five sites. Sand and gravel production was considerably less than in 1959 as demand for road material slackened. Production was reported by six operators. The Alamo field yielded a small quantity of petroleum. Lakeside Refining Co., Kalamazoo, refined crude oil.

**Kalkaska.**—About 29,000 barrels of petroleum was produced, nearly all from the Kalkaska County part of the Beaver Creek field. Natural gas production totaled 94 million cubic feet. Small quantities of road materials (crushed stone and sand and gravel) were produced.

**Kent.**—Gypsum mines and processing plants were operated in the Grand Rapids area by Bestwall Gypsum Co. and Grand Rapids Plaster Co. Wallboard, lath, sheathing, and plaster were produced.

Digitized by Google

Sand and gravel valued at $1.7 million was produced, up nearly $300,000 from 1959. Local road building stimulated demand.

Peat bogs in the county yielded moss, humus, and reed-sedge peat which was used for soil conditioning. Nearly 174,000 barrels of petroleum and 22 million cubic feet of natural gas was produced from fields in the county.

**Lake.**—The Reed City, Sauble, and Chase fields produced 7,200 barrels of petroleum. Sand and gravel was produced by the county highway department for road use.

**Lapeer.**—Calcium chloride and calcium magnesium chloride were recovered from well brines by Wilkinson Chemical Co. at Mayville. The county lead in peat production with 65,000 tons. Sand and gravel production was reported from three operations.

**Lenawee.**—Portland and masonry cements were produced at Cement City by General Portland Cement Co. Clay for use at the plant was produced near Rollin. Heavy clay products were made from clay mined at Tecumseh by Comfort Brick & Tile Co. Peat was dug from a bog near Tecumseh. Sand and gravel production was reported from eight sites.

**Mackinac.**—Large limestone quarries were operated by Inland Steel Co. and Michigan Limestone Division of U.S. Steel Corp. Output was substantially higher than in 1959 because of greater demand for flux stone at steel mills. Most of the limestone produced was shipped by boat to consumers from ports at Cedarville and Port Inland. Other uses for the limestone produced included riprap, roadstone, agstone, cement, lime, chemical, and other industrial. Sand and gravel was produced at five sites.

**Macomb.**—Sand and gravel valued at over $1.2 million was produced by 18 operators. Output was about the same as in 1959. Most of the material was used in the Detroit metropolitan area for building and road construction.

**Manistee.**—Natural brines from the Filer sandstone formation yielded bromine and magnesium compounds. Chemical plants were operated in the Manistee area by Great Lakes Chemical Co., Michigan Chemical Co., Morton Chemical Co., and Standard Lime and Cement Co. Salt extracted from artificial brines was produced by Manistee Salt Works and Morton Salt Co. Industrial sands and building and road material were produced at four sites.

**Marquette.**—Iron ore was produced by Cleveland-Cliffs Iron Co. (8 mines), Inland Steel Co. (2 mines), and Jones & Laughlin Steel Corp., North Range Mining Co., and Pickands Mather & Co. (1 mine each). Iron ore shipments were over 40 percent larger than in 1959.

The Humboldt Mining Co. completed construction of its iron-ore pelletizing plant and began producing in September. The plant used jaspilite ore. Another facility in the county, the Eagle Mills pelletizing plant of the Cleveland-Cliffs Iron Co., also used jaspilite ore. Sand and gravel production was reported by seven operators.

**Mason.**—Chemical plants in the Ludington area produced bromine, calcium chloride and calcium magnesium chloride, magnesium compounds, and lime. The new limekiln at the Ludington plant of the Dow Chemical Co. was completed during the year. It was said to be

**TABLE 8.—Mine production of copper, in terms of recoverable metal**

| Year | Mines producing | | Material treated | | Copper | |
|---|---|---|---|---|---|---|
| | Lode | Tailing | Ore (short tons) | Tailing (short tons) | Short tons | Value |
| 1951-55 (average) | 10 | 2 | 2,841,141 | 1,885,572 | 28,887 | $17,538,587 |
| 1956 | 12 | 3 | 6,427,095 | 2,233,599 | 61,526 | 52,297,100 |
| 1957 | 14 | 3 | 5,939,034 | 2,369,546 | 58,400 | 35,156,800 |
| 1958 | 11 | 2 | 5,957,879 | 1,336,077 | 58,005 | 30,510,630 |
| 1959 | 10 | 3 | 5,666,533 | 1,940,455 | 55,300 | 33,954,200 |
| 1960 | 9 | 3 | 5,600,290 | 2,192,818 | 56,385 | 36,199,170 |

The price quoted by primary producers for electrolytic copper, delivered, opened in 1960 at 33 cents a pound, rose to a high of 34.5 cents in January. On October 13 it was quoted at 30 cents, the price which held for the balance of the year.

**Iron Ore.**—Iron-ore shipments were nearly 50 percent larger than in 1959, although they fell short of the 10-year average. After midyear the increased demand resulting from the 1959 strike began to lag and shipments fell off and stocks at the mines increased. By yearend stocks of crude ore were nearly 500,000 tons larger than at the end of 1959. Twenty-two underground and five open-pit mines were active.

Mining costs declined below the 1959 level as well as below the 5-year average. According to a study by the Michigan Department of Conservation,[2] the average cost per ton (delivered at Lake Erie ports) for underground mines was $10.69 in 1960 compared with $11.34 in 1959. The cost per ton for labor fell to $3.07 from $3.46, supplies to $1.42 from $1.52, taxes (excluding Federal income tax) to $0.60 from $0.84, and general overhead to $1.16 from $1.19. Marketing costs remained at $0.07, and transportation costs decreased $0.09 to $3.11 from $3.20.

| Total 1854–1960 | 309,435 | [2] 254,676 | [2] 244,284 | 808,395 |

[1] Exclusive of iron ore containing 5 percent or more manganese, natural.
[2] Distribution by range partly estimated before 1906.

On the Gogebic range, average cost per ton (delivered at Lake Erie ports) for underground mines was $11.80 in 1960 and $13.10 in 1959; on the Marquette range, costs fell to $10.88 from $11.63; and on Menominee range to $9.87 from $10.08. The decline in costs resulted from the closing of higher-cost mines as demand fell off.

Of the ore mined in 1960, 28 percent came from open pits and 72 percent from underground mines. Average iron content of usable ore produced was 53.79 percent natural.

The trend to the use of concentrate from jaspilite ores continued, and 11.6 percent of iron-ore shipments were from this source, compared with 8.5 percent in 1959.

At yearend estimated reserves of iron ores in Michigan totaled 124 million tons,[3] not including about 1.8 billion tons[4] of low-grade hematitic ore.

The average weighted mine value of Michigan iron ore, without respect to grade, was $8.88 a long ton compared with $8.68 in 1959.

Except for a small quantity of crude ore used in manufacturing iron-oxide pigments, Michigan iron ore was shipped to producers of pig iron and steel. Approximately 98 percent of the iron ore shipped was transported by rail to ore docks at Ashland, Wis., and Escanaba

[1] Exclusive of iron ore containing 5 percent or more manganese, natural.

**TABLE 11.—Usable iron ore produced, by ranges[1]**

(Thousand long tons)

| Year | Marquette range | Menominee range (Michigan part) | Gogebic range (Michigan part) | Total |
|---|---|---|---|---|
| 1951–55 (average) | 5,231 | 4,275 | 2,972 | 12,478 |
| 1956 | 5,869 | 4,264 | 2,910 | 13,043 |
| 1957 | 6,557 | 4,201 | 2,868 | 13,626 |
| 1958 | 4,111 | 2,896 | 1,397 | 8,404 |
| 1959 | 2,851 | 2,616 | 1,663 | 7,129 |
| 1960 | 6,619 | 4,079 | 2,169 | 12,866 |
| Total 1854–1960 | 309,435 | [2] 254,676 | [2] 244,284 | 808,395 |

[1] Exclusive of iron ore containing 5 percent or more manganese, natural.
[2] Distribution by range partly estimated before 1906.

On the Gogebic range, average cost per ton (delivered at Lake Erie ports) for underground mines was $11.80 in 1960 and $13.10 in 1959; on the Marquette range, costs fell to $10.88 from $11.63; and on Menominee range to $9.87 from $10.08. The decline in costs resulted from the closing of higher-cost mines as demand fell off.

Of the ore mined in 1960, 28 percent came from open pits and 72 percent from underground mines. Average iron content of usable ore produced was 53.79 percent natural.

The trend to the use of concentrate from jaspilite ores continued, and 11.6 percent of iron-ore shipments were from this source, compared with 8.5 percent in 1959.

At yearend estimated reserves of iron ores in Michigan totaled 124 million tons,[3] not including about 1.8 billion tons[4] of low-grade hematitic ore.

The average weighted mine value of Michigan iron ore, without respect to grade, was $8.88 a long ton compared with $8.68 in 1959.

Except for a small quantity of crude ore used in manufacturing iron-oxide pigments, Michigan iron ore was shipped to producers of pig iron and steel. Approximately 98 percent of the iron ore shipped was transported by rail to ore docks at Ashland, Wis., and Escanaba

[3] Work cited in footnote 2.
[4] Pardee, F. G., and Kennedy, B. E., Low-Grade Ore Occurrences in Michigan: Univ. of Minnesota, 9th Ann. Min. Symposium, 1948, p. 24.

Digitized by Google

and Marquette, Mich., and thence by vessel to lower Lake ports. The balance was all-rail shipments to consuming districts.

Dates of first and last Lake shipments of ore in 1960 from Michigan and Wisconsin ports were: Ashland, April 17—November 6; Escanaba, March 28—November 17; Marquette, April 16—November 26; Superior, April 12—November 18.

**Manganiferous Ore.**—Shipment of manganiferous ore (containing 5 to 35 percent manganese natural) was resumed from the Cannon mine in Iron County. Production was not significant as a source of manganese. The ore was sold as an iron ore and a premium was paid for the contained manganese.

**TABLE 12.—Manganiferous iron ore (containing 5 to 10 percent manganese, natural) and ferruginous manganese ore (containing 10 to 35 percent manganese, natural) shipped from mines**

| Year | Long tons | Year | Long tons |
|---|---|---|---|
| 1951–55 (average) | 32,738 | 1958 | 100,479 |
| 1956 | | 1959 | |
| 1957 | 110,310 | 1960 | 161,125 |

**Pig Iron and Steel.**—The manufacture of pig iron and steel was based in Wayne County where five companies operated a total of 52 furnaces. The annual steel capacity was 7,984,000 tons, and 1960 production totaled 6,534,000 tons according to data published by the American Iron and Steel Institute. Pig-iron shipments increased 25 percent in quantity and 19 percent in value over 1959. Basic and Bessemer grades were produced.

McLouth Steel Corp., Detroit, constructed new facilities for handling and producing sinter at its Trenton works.

Jones and Laughlin Steel Corp. constructed an addition to the cold-finish processing building at its stainless steel plant in Detroit, to house wire-drawing equipment and inventory storage racks for wire coils. New equipment was purchased for annealing, wire drawing, and abrasive cutting at the same facility.

## MINERAL FUELS

**Natural Gas and Natural Gas Products.**—Allegan County continued as the leading gas producing area with 40 percent of the State total. Oil well gas from the Albion-Pulaski-Scipio trend fields in Calhoun, Hillsdale, and Jackson Counties contributed 15 percent. Major production also was reported from fields in Crawford, Livingston, Osceola, Roscommon, St. Clair, Wayne, and Washtenaw Counties. The above areas accounted for nearly seven-eighths of the production; the remainder came from fields in 18 counties.

New fields developed during the year were Heath field in Allegan County, Springport field in Jackson County, Lenox field in Macomb County, and Puttygut field in St. Clair County. Two fields were abandoned—Cedar Creek field in Muskegon County and Mineral Springs field in Osceola County.

Digitized by Google

**Peat.**—Peat production increased for the eighth consecutive year. It was produced from bogs in 17 countries, with the largest production reported from Sanilac, St. Clair, Lapeer, and Oakland Counties. Output was sold mainly as a soil conditioner.

**Petroleum.**—The upward trend in petroleum production, which began in 1959 after 11 years of decline, continued in 1960. Output was 50 percent greater than in 1959. According to data published by the Michigan Department of Conservation,[5] exploratory and development well permits increased 27 percent, totaling 824. Exploratory wells drilled during the year resulted in four new oil fields, four new gas-fields, one new oil pool, and six extensions. Exploratory methods employed in these 15 discoveries were: Subsurface geology—five; trend geology—six; gravity—three; and nontechnical—one. Undeveloped acreage under lease exceeded 3.6 million acres.

Most of the drilling and half of the oil production were in fields of the Albion-Pulaski-Scipio trend in Calhoun, Hillsdale, and Jackson Counties in southern Michigan. Output in this area quadrupled from 2 million barrels in 1959 to nearly 8 million barrels. New pools and extensions extended the fracture zone to 38 miles. In 1960, 235 oil wells were completed along the trend.

During the latter part of the year attention shifted to further exploration of Niagaran reefs in eastern Michigan. These reefs are characterized by unstratified coral buildups, with crude sorting around the flanks. Oil and gas was produced from the overlying dolomite and the reef. Favorable economic factors included accessibility, marketing facilities, and relatively shallow depth.

Petroleum was produced in 40 counties. In addition to the areas described above, output in Bay, Isabella, Missaukee, Montcalm, and Osceola Counties each exceeded 500,000 barrels. Fourteen refineries, with a rated crude throughput capacity of 174,000 barrels daily, were operated.

**TABLE 13.—Value of mineral production in Michigan, by counties[1]**

| County | 1959 | 1960 | Minerals produced in 1960 in order of value |
|---|---|---|---|
| Alcona | $96,987 | $89,600 | Sand and gravel. |
| Alger | 75,208 | 94,123 | Do. |

## REVIEW BY COUNTIES

All 83 counties reported mineral production, with Marquette replacing Wayne as the leading producing county. Sand and gravel was produced in all 83 counties and was the only mineral commodity reported in 13.

The value of mineral production exceeded $1 million in 46 counties. The value of output increased in 46 counties and decreased in 37. The largest losses were recorded in counties producing sand and gravel.

**Allegan.**—Petroleum and natural gas were the major mineral commodities. Allegan County led in natural gas output. Marl, peat, and sand and gravel also were produced. Sand and gravel, used mostly for road construction, was mined at nine sites.

**Alpena.**—Huron Portland Cement Co. manufactured portland and masonry cements at Alpena using locally produced limestone and clay. Sand and gravel was produced at three sites for building and paving use.

**Antrim.**—Penn-Dixie Cement Co. mined clay for use at its Petoskey cement plant. The State and county highway department mined sand and gravel for road use.

**Arenac.**—Roadstone and sand and gravel for paving and building use were produced at six sites. Petroleum was produced at five fields. Nearly two-thirds of the output came from the Deep River and Sterling fields.

**Baraga.**—Cleveland-Cliffs Iron Co. resumed production of iron ore from its Ohio open-pit mine. Road material was mined at two sand and gravel pits, and a small quantity of sandstone was quarried for building purposes.

**Barry.**—Sand and gravel for building and paving use was produced at five pits. Marl for agricultural use was produced near Caledonia and Nashville. Petroleum was produced from three fields. The Hope field had the largest output.

**Bay.**—Aetna Portland Cement Co. produced portland and masonry cements at Bay City. Over 500,000 barrels of petroleum was produced, with the major part coming from the Kawkawlin field. Crude oil was refined at Bay City by the Bay Refining Corp. Monitor Sugar Div. of the Robert Gage Coal Co. produced lime for its own use.

**Berrien.**—Eight sand and gravel operations produced over $1 million of material for building, paving, and industrial (chiefly molding sand) purposes. Small quantities of marl and peat also were produced.

**Branch.**—Sand and gravel output from four sites was used for fill, building, and paving purposes. Marl was produced from a pit near Quincy. Five marl pits in the Sherwood area, that produced in 1959, were idle during the year.

**Calhoun.**—Petroleum was the major mineral commodity. Output was over 2.4 million barrels from fields of the Albion-Pulaski-Scipio trend, an increase of over 2 million barrels above that of 1959.

The value of sand and gravel produced declined sharply from $3 million to less than $750,000 chiefly because of a contract by the State

615629—61——34

Digitized by Google

highway department was completed. Output came from eight pits. A small quantity of marl for agricultural purposes also was produced.

**Cass.**—Marl was dug from pits near Cassopolis and Jones. Sand and gravel was produced at four sites.

**Charlevoix.**—Limestone quarried at Vanderbilt by the Charlevoix Lime and Stone Co. was used for rough construction, flux, and agstone. The county and State highway departments produced road material from sand and gravel pits.

**Cheboygan.**—Roadstone was produced by the Afton Stone & Lime Co. Paving material was mined from gravel pits by Hugh Mason & Sons (Gaylord) and the Michigan State Highway Department.

**Chippewa.**—Limestone was quarried on Drummond Island by Drummond Dolomite, Inc. The material was crushed and sold as flux, and for concrete aggregate and roadstone, agstone, and stone sand. Sand and gravel for paving purposes was produced by I. L. Whitehead Co. of Sault Ste. Marie.

**Clare.**—Over 400,000 barrels of petroleum was produced at nine fields. Largest production came from the Hamilton, Headquarters, and Skeels fields. Over 317 million cubic feet of natural gas also was produced, chiefly from the North Hamilton and Headquarters fields. A small quantity of sand and gravel was produced by the State highway department.

**Clinton.**—Grand Ledge Clay Products Co. mined miscellaneous clay for manufacturing heavy clay products. Sand and gravel was produced at four sites. Humus peat, for horticultural use, was dug from a bog near Ovid.

**Crawford.**—Over 150,000 barrels of petroleum and nearly 1 billion cubic feet of natural gas was produced from the Beaver Creek field. Sand and gravel for road use was produced at two sites.

**Delta.**—Road material was produced from one limestone quarry and four sand and gravel pits. Two pits produced sand and gravel for building purposes only.

**Dickinson.**—The Groveland open-pit iron mine was operated by M. A. Hanna Co. The jaspilite ore was shipped to a concentrating plant near Randville. The Cornell and Bradley mines remained closed. Limestone was quarried by the Metro-Nite Co. near Felch, and the material was shipped to the company mill in Wisconsin and crushed and sold as filler. Jupiter Rock Products Co. of Sagola also quarried and crushed limestone. Sand and gravel for road use was produced at three pits.

**Eaton.**—Miscellaneous clay for use in manufacturing heavy clay products was mined by American Vitrified Products Co. and Grand Ledge Clay Products Co. Cheney Limestone Co. operated a quarry near Bellevue and crushed the output for concrete aggregate, roadstone, and agstone. Some rubble was also produced. Sand and gravel was produced at seven sites. A small quantity of moss peat was dug and sold for horticultural use.

**Emmet.**—The Penn-Dixie Cement Corp. plant at Petoskey manufactured portland and masonry cements and also quarried limestone for use in the plant. The State highway department produced road gravel.

Digitized by Google

**Genesee.**—A small quantity of petroleum was produced from the Otisville field. Eight sand and gravel pits yielded material valued at over $750,000. Foundry sand, fill, and building and paving material were produced.

**Gladwin.**—Petroleum, totaling 445,000 barrels, was produced from 12 fields. The Buckeye and Skeels fields had the largest output. A small amount of gravel for road use was produced.

**Gogebic.**—Pickands Mather & Co. produced iron ore from the Geneva-Newport, Peterson, and Sunday Lake underground mines. North Range Mining Co. operated the Penokee mine. Sand and gravel was produced at four sites.

**Gratiot.**—Michigan Chemical Co. produced bromine, calcium chloride, magnesium compounds, and salt at its St. Louis plant from well brines. During the year the company acquired from the U.S. Atomic Energy Commission (AEC) a rare-earth ion-exchange facility at St. Louis. The unit was originally built by Michigan Chemical Co. for production of rare-earth oxides for AEC. After the contract expired in 1959, the facility was placed on a standby basis and then declared surplus.

Sand and gravel was produced at four operations. Over 200,000 barrels of petroleum was produced, mostly from Sumner field. Leonard Refineries, Inc., operated two crude oil refineries at Alma.

**Hillsdale.**—Petroleum output was the largest of any county in the State. Production increased to nearly 3.7 million barrels from 1.3 million in 1959 and came from fields of the Albion-Pulaski-Scipio trend. Pits near Hanover and Reading yielded marl and a quarry near Hillsdale produced sandstone for flagging. Eight operators reported sand and gravel production.

**Houghton.**—Copper was produced by Calumet & Hecla, Inc., Calumet; Copper Range Co., Painesdale; and Quincy Mining Co., Hancock.

Calumet & Hecla, Inc., operated the Ahmeek No. 2, Allouez H. C. and Allouez conglomerate, Centennial No. 2, Peninsula, Seneca, and Osceola No. 13 mines. New centralized pumping facilities were installed on the Osceola lode. Explorations included over 13,000 feet of drifting and nearly 15,000 feet of diamond drilling.

Copper Range Co. operated the Champion mine throughout the year and milled the output at the Freda mill. Tailing from the Redridge sands also was treated at the Freda mill. Concentrates were processed at the White Pine Co. smelter in Ontonagon County.

Quincy Mining Co. operated its tailing reclamation plant continuously throughout the year, and the concentrate was smelted at the company smelter at Hancock.

Limestone Mountain Co. produced agricultural limestone, and the Houghton County Road Commission quarried basalt for use as roadstone. Road material was produced from three gravel pits.

**Huron.**—Limestone was quarried and crushed for concrete aggregate and roadstone, railroad ballast, and agstone by Wallace Stone Co., Bay Port. Some rough construction stone also was produced. Five operators produced sand and gravel. The Dwight and Grant fields yielded a small quantity of petroleum.

Digitized by Google

Ingham.—The Lansing Board of Water and Light produced quicklime for its own consumption from slurry from which precipitated in the water purification process. Limestone was quarried from a limestone deposit by Central Michigan Sand and Gravel, East Lansing. Sand and gravel operations yielded materials valued at over $40,000.

Ionia.—The part of the Bloomer field lying in Ionia County yielded a small quantity of petroleum. Sand and gravel production was up as portable plant operations resumed work in the county. The material was used mostly for road construction. Limestone quarried near Ionia was crushed for use as concrete aggregate and roadstone.

Iosco.—Gypsum mines were operated near Tawas City by National Gypsum Co. and near Alabaster by United States Gypsum Co. National Gypsum Co. also operated a processing plant at National City and portage facilities at Tawas Bay for shipment to its plants in Illinois and Ohio. The county highway department produced a small quantity of road gravel.

Iron.—The value of mineral production increased over 50 percent because of greater iron-ore production. The M. A. Hanna Co. operated the Cannon, Hiawatha, Homer, and Wauseca mines. Inland Steel Co. operated the Bristol and Sherwood mines. Pickands Mather & Co. the Buck unit, and Republic Steel Corp. the Tobin Group. Shipments of manganiferous ore were resumed from the Cannon mine. Road material was produced from two sand and gravel operations.

Isabella.—More than 760,000 barrels of petroleum and 300 million cubic feet of natural gas were produced. The Coldwater field was the principal producer. Marl for agricultural purposes was mined near Weidman, and sand and gravel production was reported by four operators. Crude oil was refined at Mt. Pleasant by Leonard Refineries, Inc.

Jackson.—The Pulaski field section of the Albion-Pulaski-Scipio trend yielded 1.8 million barrels of petroleum, up from 200,000 barrels in 1959. More than 600 million cubic feet of natural gas also was produced. Sandstone for building use was quarried at three sites near Napoleon. Crushed limestone for concrete aggregate, roadstone, and agstone was produced by Jeffrey Limestone Co., Parma. A pit near Horton yielded marl for agricultural use. Sand and gravel was produced at six sites and was used mostly for building and road construction.

Kalamazoo.—Peat for horticultural use was dug from bogs near Kalamazoo and Scott. Marl for agricultural use was produced at five sites. Sand and gravel production was considerably less than in 1959 as demand for road material slackened. Production was reported by six operators. The Alamo field yielded a small quantity of petroleum. Lakeside Refining Co., Kalamazoo, refined crude oil.

Kalkaska.—About 29,000 barrels of petroleum was produced, nearly all from the Kalkaska County part of the Beaver Creek field. Natural gas production totaled 94 million cubic feet. Small quantities of road materials (crushed stone and sand and gravel) were produced.

Kent.—Gypsum mines and processing plants were operated in the Grand Rapids area by Bestwall Gypsum Co. and Grand Rapids Plaster Co. Wallboard, lath, sheathing, and plaster were produced.

Digitized by Google

Sand and gravel valued at $1.7 million was produced, up nearly $300,000 from 1959. Local road building stimulated demand.

Peat bogs in the county yielded moss, humus, and reed-sedge peat which was used for soil conditioning. Nearly 174,000 barrels of petroleum and 22 million cubic feet of natural gas was produced from fields in the county.

**Lake.**—The Reed City, Sauble, and Chase fields produced 7,200 barrels of petroleum. Sand and gravel was produced by the county highway department for road use.

**Lapeer.**—Calcium chloride and calcium magnesium chloride were recovered from well brines by Wilkinson Chemical Co. at Mayville. The county lead in peat production with 65,000 tons. Sand and gravel production was reported from three operations.

**Lenawee.**—Portland and masonry cements were produced at Cement City by General Portland Cement Co. Clay for use at the plant was produced near Rollin. Heavy clay products were made from clay mined at Tecumseh by Comfort Brick & Tile Co. Peat was dug from a bog near Tecumseh. Sand and gravel production was reported from eight sites.

**Mackinac.**—Large limestone quarries were operated by Inland Steel Co. and Michigan Limestone Division of U.S. Steel Corp. Output was substantially higher than in 1959 because of greater demand for flux stone at steel mills. Most of the limestone produced was shipped by boat to consumers from ports at Cedarville and Port Inland. Other uses for the limestone produced included riprap, roadstone, agstone, cement, lime, chemical, and other industrial. Sand and gravel was produced at five sites.

**Macomb.**—Sand and gravel valued at over $1.2 million was produced by 18 operators. Output was about the same as in 1959. Most of the material was used in the Detroit metropolitan area for building and road construction.

**Manistee.**—Natural brines from the Filer sandstone formation yielded bromine and magnesium compounds. Chemical plants were operated in the Manistee area by Great Lakes Chemical Co., Michigan Chemical Co., Morton Chemical Co., and Standard Lime and Cement Co. Salt extracted from artificial brines was produced by Manistee Salt Works and Morton Salt Co. Industrial sands and building and road material were produced at four sites.

**Marquette.**—Iron ore was produced by Cleveland-Cliffs Iron Co. (8 mines), Inland Steel Co. (2 mines), and Jones & Laughlin Steel Corp., North Range Mining Co., and Pickands Mather & Co. (1 mine each). Iron ore shipments were over 40 percent larger than in 1959.

The Humboldt Mining Co. completed construction of its iron-ore pelletizing plant and began producing in September. The plant used jaspilite ore. Another facility in the county, the Eagle Mills pelletizing plant of the Cleveland-Cliffs Iron Co., also used jaspilite ore. Sand and gravel production was reported by seven operators.

**Mason.**—Chemical plants in the Ludington area produced bromine, calcium chloride and calcium magnesium chloride, magnesium compounds, and lime. The new limekiln at the Ludington plant of the Dow Chemical Co. was completed during the year. It was said to be

Digitized by Google

one of the largest kilns ever built for producing lime. Molding, engine, and grinding sands were produced from a pit near Ludington. The County Road Commission produced road gravel. Petroleum production declined to 142,000 barrels. In 1959, nearly 250,000 barrels was produced.

Missaukee. Marl for agricultural use was produced near Blanchard and Mecosta. Sand and gravel was produced at three sites. About [illegible] barrels of petroleum and 212 million cubic feet of natural gas were produced from fields in the county.

Montmorency. Quicklime and hydrated lime were produced by Lime-stone Products Division of Northwestern-Hanna Fuel Co. and sold for chemical and industrial purposes. Sand and gravel was produced by [illegible] operators.

Midland. The Dow Chemical Co. extracted bromine, calcium chloride [illegible] magnesium oxide, magnesium compounds, and potash [illegible] Silurian formation. Salt from artificial brines [illegible]

[illegible] Chemical Corp. completed a petrolatum plant [illegible] purchased locally. The [illegible] plant in Ohio. Oilfields [illegible] barrels of petroleum and 18 million [illegible]

[illegible] the principal mineral [illegible] million [illegible] A small amount of sand [illegible]

[illegible]

**Oakland.**—Sand and gravel valued at more than $5 million was produced at 26 operations, the largest output of any county in the State. Oakland County also was the fourth largest producer of peat. Small quantities of petroleum and natural gas were produced from the Northville field.

**Oceana.**—Seven fields yielded 251,000 barrels of petroleum and 47 million cubic feet of natural gas. Stony Lake, Pentwater, and Crystal Valley fields produced the largest quantities. Sand and gravel for building and paving use also was produced.

**Ogemaw.**—Nearly 500,000 barrels of petroleum and over 800 million cubic feet of natural gas were produced. The Rose City field yielded all the gas and with the West Branch field nearly all the oil. Crude oil was refined at West Branch Refineries, Inc., in West Branch. Sand and gravel was produced at four sites.

**Ontonagon.**—Copper was mined, milled, and smelted by White Pine Copper Co. (a wholly-owned subsidiary of Copper Range Co.). Operations in 1960 did not begin until settlement of a labor strike on February 21. Development of the newly discovered southwest ore body continued. Much diamond drilling and development shaft-sinking was accomplished during the year. Sand and gravel for road use was produced by the county and State highway departments.

**Osceola.**—The Reed City fields yielded the major part of the petroleum (528,000 barrels) and natural gas (445 million cubic feet) produced in the county. The Osceola Refining Co. at Reed City refined crude oil. A substantial quantity of sand and gravel and a small amount of marl also were produced.

**Ottawa.**—Production of about 2.2 million tons of sand and gravel was reported by eight operators. Industrial sands and building and road material were produced. A small amount of marl was dug near Denison. Nearly all of 214,000 barrels of petroleum produced came from the Walker field.

**Presque Isle.**—Limestone for a variety of industrial uses and for concrete aggregate, roadstone, and agriculture was produced at the quarries of both Michigan Limestone Division of U.S. Steel Corp. at Roger City and Chemstone Co. (operators for the Presque Isle Corp.) at Presque Isle. Much of the output from these operations was shipped by water to consumers in the Great Lakes area.

The Onaway Stone Co. produced dimension limestone from its quarry near Onaway. Part of the output was sold as rubble and rough construction stone, and the balance was milled for use as building stone and flagging. The Straits Aggregate Corp. operated a sand and gravel plant at Millersburg, and sold the output for railroad ballast, building and paving material, and fill.

**Roscommon.**—Over 1.2 billion cubic feet of natural gas and 271,000 barrels of petroleum were produced, mostly from the Headquarters and St. Helen's fields. Production of sand and gravel valued at $700,000 was reported by four operators. Most of it was used in road construction.

**Saginaw.**—Clay was mined in the Bay City-Saginaw area for use in cement and for filler and refractories. Road gravel was produced by the State highway department. Nearly 53,000 barrels of petroleum was produced, chiefly from the Birch Run field.

**St. Clair.**—Portland cement was produced at the Port Huron plant of the Peerless Cement Co., Division of American Cement Corp. The company mined clay from a pit at Smith's Creek for its own use.

Diamond Crystal Salt Co. recovered salt from artificial brines produced by dissolving salt from the Salina formation at St. Clair. Peat was produced near Capac. Four operators reported production of sand and gravel.

Five fields yielded 408,000 barrels of petroleum, of which 90 percent came from the Boyd and Peters fields. Over 1 billion cubic feet of natural gas was recovered from two oilfields and three gasfields.

**St. Joseph.**—Marl was recovered from pits near Three Rivers, Sherwood, and Burr Oak. A bog near Three Rivers yielded peat. Sand and gravel produced by three operators was used for fill, building purposes, and road construction.

**Sanilac.**—Peat valued at nearly $1 million was produced from bogs near Miden City and Sandusky, and sold for horticultural use. Road material was recovered from four sand and gravel pits.

**Shiawassee.**—A clay pit near Corunna yielded miscellaneous clay that was used in manufacturing heavy clay products by Michigan Vitrified Tile Co. Sand and gravel mined at five sites was used for fill and building and road construction.
